# FOREST AND STREAM.

A WEEKLY JOURNAL OF THE ROD AND GUN.

TERMS, \$4 A YEAR. 10 CTS. A COPY.  
SIX MONTHS, \$2.

NEW YORK, FEBRUARY 1, 1883.

VOL. XX.—No. 1.  
Nos. 29 & 40 PARK ROW, NEW YORK.

## CORRESPONDENCE.

THE FOREST AND STREAM is the recognized medium of entertainment, instruction and information between American sportsmen. Communications upon the subjects to which its pages are devoted are respectfully invited. Anonymous communications will not be regarded. No name will be published except with writer's consent. The Editors are not responsible for the views of correspondents.

## SUBSCRIPTIONS.

May begin at any time. Subscription price, \$4 per year; \$2 for six months; to a club of three annual subscribers, three copies for \$10; five copies for \$14. Remit by registered letter, money-order, or draft, payable to the Forest and Stream Publishing Company. The paper may be obtained of newdealers throughout the United States and Canada. On sale by the American Exchange, 449 Strand, W. C., London, England. Subscription agents for Great Britain—Messrs. Samson Low, Marston, Searle and Rivington, 188 Fleet street, London.

## ADVERTISEMENTS.

Only advertisements of an approved character inserted. Inside pages, nonpareil type, 25 cents per line. Special rates for three, six and twelve months. Reading notices \$1.00 per line. Eight words to the line, twelve lines to one inch. Advertisements should be sent in by the Saturday previous to issue in which they are to be inserted. Unpaid advertisements must invariably be accompanied by the money or they will not be inserted. Address all communications,

Forest and Stream Publishing Co.

ANSWERS TO CORRESPONDENTS.

Such a law as that proposed would be pernicious in the extreme. We cannot believe that it will be enacted by the Legislature. It would be a step backward, a sacrifice of the public good to the grasping greed of a few selfish men.

The proposition of these Maine petitioners is a very fair illustration of the unscrupulous, every-man-for-himself spirit that to a lamentable degree inspires the game legislation of this country. There is hardly a game law on the statute books to-day that has not been put there after a desperate conflict with such selfish and improvident clamors for present gain; or else contains on its face some special clause or exception in favor of this class, and in total disregard of the rights and interests of the community at large.

This condition of affairs will continue just so long as the sportsmen of a State are content to leave game legislation in the hands of any and every man who cares to tinker at it for his own private ends. There ought to be in every State in this Union a live society of sportsmen, representing the whole State, and working together to secure a law framed for the common good.

## ARCTIC EXPLORATION.

IN his very entertaining paper to-day Lieut. Schwatka illustrates the point, made by a correspondent of this journal last June, that the Arctic exploration of the future must be conducted on different principles from that which has proved so disastrous in the past. The successful Arctic explorer must be, first, a successful sportsman, able to avail himself of the game resources of the country. Lieut. Schwatka's experience demonstrated very clearly and conclusively the practicability of living on the country. He and the members of his party used their rifles, and with them secured a constant supply of food. They have established a precedent, some modification of which must be adopted by future Arctic explorers, if they are to do any more than add new names to the long and melancholy list of those who have perished in the futile Arctic search.

The situation of a trained hunter in such a country, adapting himself to the habits of life of the native dwellers there, self-reliant and capable of winning a subsistence by his skill with the rifle, is in decided contrast to that of the shipwrecked seaman wholly ignorant of the ways of game and inexperienced and incapable in its capture. We commend the account of Lieut. Schwatka's hunting in the North to the consideration of future Arctic explorers.

## THE TARIFF ON FIRE-ARMS.

THE present import duty on shotguns is thirty-five per cent. ad valorem. The Tariff Commission recommended an ad valorem duty of twenty-five per cent., and the Senate last Monday agreed to retain the present rate of thirty-five per cent. ad valorem, with ten per cent. on barrels in the rough. But the Tariff Bill now before the House of Representatives provides that the tax on fire-arms shall be as follows: "All sporting breech-loading shotguns, with plain or twist barrels, of iron or steel, five dollars each; with laminated iron and steel or stub twist barrels, fifteen dollars each; with Damascus or other fancy barrels, twenty-five dollars each; all other shotguns, and all other fire-arms not provided for in this act, thirty-five per centum ad valorem."

The increase of duty here called for on the cheapest grade of imported guns would be 900 per cent. With this we have no fault to find; if Congress could put an absolutely prohibitory tax on such guns it would admirably serve the interests of society. It is also patent that were the tariff amended according to the provisions of this bill, the price of expensive guns would be lessened just in proportion as the uniform duty of twenty-five dollars is less than the thirty-five per cent. on their cost in the foreign market. It is with neither of these extremes, however, that we are especially concerned, but rather with the arms of moderate price, the guns most in demand by the class of men who constitute the majority of sportsmen.

The proposed duty would materially increase the cost of such guns, and the burden of the tax would fall upon those who are least fitted to bear it. In fact, if this bill is put through, so great will be the discrimination against this grade of arms, that the imported goods specified will be driven out of the market, and the manufacture will be virtually in control of American makers. No such protection as that contemplated by this bill is necessary. There is ample profit in the manufacture of shotguns in this country with the foreign competition as it is at present. We can conceive of no good to result from the cutting off of that healthful competition.

RELIEF FOR THE FOWL.—The seizure and destruction of two of the big swivel guns, which have long been known to be in use at Spesutia Island, will be a severe blow to the poachers. The capture and fine of two of the ringleaders of the gang will not be without effect in intimidating the outlaws, but that is a small matter compared with the taking of the guns. These murderous weapons are not easily obtained, and it will require time and money to replace them. Unfortunately, only a portion of the armament appears to have been secured, but so far as it went, the raid on the outlaws is a most encouraging sign of the interest taken in their rights by the owners of ducking shores in Maryland. A constant system of espionage and harassing of these and other lawless individuals in the winter feeding grounds of our fowl could not fail to work great good to the shooting all along the coast. Nothing is more destructive of fowl shooting than the use of lights and these big guns, and we hope that the day is not far distant when an advanced public sentiment will prevent the use of such engines in any waters in the land. The authorities, or, better still, the sportsmen of some of the Southern States, should look also after the duck traps which are being used in some Southern waters. These traps should be destroyed, and the owners, whether white or black, should be promptly called in jail.

BIG GAME.—The average American understands the value of advertising; he scruples at nothing that will bring his scheme and his goods before the public. In a recent police parade in this city the ranks of blue-coated officers marched bravely through the streets to the music of the band, and close upon the rear of the last column followed a wagon setting forth the charms of a cat show in a dime museum. This shrewd genius successfully used the police force of a great city to advertise his cats. When Dr. Carver went abroad, his manager's first step was to have the marksman exhibit his skill in the presence of the Prince of Wales, that dignitary in exactly the same manner that the cat showman used the police. And now the Associated Press dispatches from abroad state: "The London *Army and Navy Gazette* says: 'We understand that the Prince of Wales, at the urgent request of the Princess of Wales, is bestirring himself to put down the cruel sport of pigeon shooting. The ladies have formed a ring, and intend boycotting Hurlingham until the Gun Club discards the pretty dove and adopts the terra-cotta pigeon, a new invention which is being brought out under the patronage of the Prince of Wales, and can be seen at work at the Ranelagh Club grounds.' There is no cat in that meal-bag, only a clay pigeon."

ON TUESDAY LAST a hearing was given by the Committee on Agriculture of the Massachusetts State Legislature to those who advocate the offering of a bounty for the destruction of English sparrows. No friends of the sparrow appeared, to raise a voice in its defense, while, on the other hand, a considerable mass of testimony was given against the bird. It was stated that the species is causing great and increasing damage to the crops, and that it is particularly destructive to apples, nearly one-half of last year's promised yield having been destroyed by it. It does not destroy insects injurious to vegetation, while it drives away our native insectivorous birds, which would, if left to themselves, do good service in this way. If the bird should ever become numerous in the West, it would do a vast amount of damage to the crops of grain. From all points of view, therefore, it is to be condemned. These arguments, with all of which the readers of FOREST AND STREAM are familiar, are advanced to induce the Legislature to take steps to abate what has become both in our large cities and our lesser towns a real nuisance.

THE YELLOWSTONE PARK.—We print in another column a very few of the numerous remarks, editorial and personal, which have been called out by the recent fight on the Yellowstone Park grab. The only hope of the engineers of this project was to have railroaded it through with such silence and celerity that the grant would have been confirmed to them before the matter could have been subjected to any scrutiny by the people or their representatives, and this they did not quite succeed in doing. As soon as the true import of the job was understood by the people, there was but one sentiment expressed in regard to the matter, and the general condemnation which it received quite frightened the projectors of the scheme from their original position. The whole matter may safely be left in such good hands as those of Senator Vest and Secretary Teller.

PROPOSED MAINE SUMMER SHOOTING.  
THE present open season for deer, caribou and moose in the State of Maine is from October first to January first. There has been presented to the Maine Legislature a petition to so amend the law as to make the open season for killing this game begin July first, thus extending the time by the addition of three months.

It is needless to say that this change is not wanted by the sportsmen of the State, but by the hotel and steamboat men and the guides. It is alleged in the petition that the time is now so short as to seriously "discourage" and "inconvenience" visiting sportsmen, who, provided the discouragements and inconveniences are not removed, will be obliged to seek other fields of slaughter and renown. It is further alleged that with this change no special harm can come to the deer. This is beautiful logic; a summer shooting season is wanted so that visiting sportsmen may shoot more deer, and yet the deer are not to suffer therefrom. It is the reasoning of greedy men, who have regard for nothing save stuffing their own pockets with the proceeds of untimely game slaughter. They know very well—no one else better—that deer shooting in June and July means death to the mother doe and death by lingering starvation for the fawns. This is not the kind of shooting that respectable sportsmen ask for; it is not the kind they would tolerate; it is sought and defended only by the class of greenhorns and butchers who like to fire into a deer in the water while their "guide" holds the victim for them—and by these same guides, who have an eye for the almighty dollar and nothing else.

Maine has a rich store of wealth in her native game supply. Her recent wise and provident action in securing better care of this resource by the appointment of game wardens, and the way in which these officers have set an example for their task, have been among the encouraging signs of the times. The State has made a good beginning. It only remains for her to pursue the same course, without regard to the selfish and improvident demands of summer shooting petitioners.

## HUNTING WITHOUT A GUN—II.

LET your gun hang on its own hooks; and go you to the wooded hill, from behind which you first saw the sun rise, over whose length and breadth you have hunted every fall and winter since you began to carry a gun. You know every ridge and hollow so well that if you were led to any part of it blindfolded you could tell where you were after you had looked about a minute. Let yourself drift about in these familiar woods some autumn day in search of nothing, and the chances are that you will find many things you never saw before.

You are not hurried. There is time for your nostrils to drink all the subtle odors of the woods, the mingled perfumes of flowers, fruitage and decay. You hear the voices in voices, the sounds beyond the environment of silence, outside sounds of civilization and husbandry piercing but not breaking the stillness of the woods. From the moss and mold at your feet to the frayed horizon that closely encompasses you, there is enough to keep your eyes busy for a day and then leave a world unexplored.

I have known fox-hunters, who year after year have ranged all the woods for ten miles about them, and who never yet saw the biggest woodpecker that lives in them, the pileated. They have heard him calling them more than once to come and see what a brave woodchopper he is, how he can make the chips fly and the woods echo to his strokes. But they had come hunting foxes, not woodpeckers, and had no time to turn out of their way to visit him, and he was too great a personage in woodpecker circles to come to them. If they desire his acquaintance, they must come to where he is doing business. Then he will show them his work. What a barkpecker he is. Wilson says that he has "seen him separate the greatest part of the bark from a large dead pine for twenty or thirty feet, in less than a quarter of an hour." With hammer and chisel in one, he can cover the roots of a tree with its iron slivers and cut a doorway to his home almost large enough for a coon's passage. He will show them his aerial paces as he hops from tree to tree, exhibiting then the white feathers of his wings, and his crest has not faded a whit since Hiawatha first dyed it. Though seldom seen he does not desert us, with the golden-winged and red-headed, but stays all the year round, and by the few country folks who see him is called woodcock, a name which fits him better than it does the horer of bogs, who by ancient usage bears it.

I wonder how many times in my hunting with a gun I had crushed the walking fern with my knees, and torn it up with my nails, as I sealed the ledge before I ever saw it. There are not a score of people of my acquaintance—hunters and woods-hunters of all sorts—who know that it grows here at all, far less that it is almost common. Having got the secret of its hiding, one finds it on almost every northward and westward-facing ledge from the rocky shores of Champlain to the backbone of Vermont, not everywhere, but here and there a patch of it, looping its small fronds along a shelf of the ancient mossy walls.

I am ashamed when I remember that I waited till I was a big boy for a lady to come all the way from Pennsylvania to show me the arbutus, growing almost as common as wintergreen and prince's pine on our rocky hills. How dull my senses were never to have caught the fragrant trail of its blossoms in the May woods, and to have followed it up till I found them blushing among their own rusty leaves and the last year's dead ones of their tall neighbors. Every one who cares for it knows where it grows now, and people come in troops to rob the woods of it for the decoration of churches at Easter. They might better leave it in these first temples. In the chippings, where the thin soil is heretofore of the shade of the trees, I find its leaves withering as if scorched by fire, but like a girdled apple tree, every spring is full of blossom, it dies with its crown on.

Till the coming of the fair Pennsylvanian, it had blossomed for me only in books, and grew as far off as the *Victoria regia*. As for finding it here, I should sooner have thought of hunting for seals in the lake, for there had been two or three of them killed in its waters or on its ice.

Though I hardly expect to find a seal or a *Victoria regia* within the limits of our State, there is no telling what fortune there is in store for me. If one stays beneath the star he was born under, watching and waiting, it may, at last, prove a lucky one.

R. E. R.

GENERAL GRANT DECLINES.—There has been a strong feeling among certain of the directors of the National Rifle Association that some strength would be gained for the organization by the use of Gen. Grant's name as president. The proffer of the position was made him but promptly declined. The nominating committee are now casting about for another available candidate.

SWIVEL GUNS.—A correspondent tells us that one member of the Committee on Game Laws, at Albany, is a professed advocate of the use of the swivel gun for duck shooting on the Hudson River. This is one very good reason why the Albany game law bills should be closely watched.

SPRING SHOOTING.—The advocates of the abolition of spring shooting are increasing in number and influence. The matter is one well worthy of agitation. We should like to hear from those who can add anything to the discussion of the subject.

## The Sportsman Tourist.

## NIMROD IN THE NORTH.

BY MR. T. FRED SCHWATKA, U. S. ARMY.

## III.—The Rifle and the Reindeer—Part One.

OF all the animals with which my party came in contact on my Arctic expedition, there are none with which I can claim such a close personal acquaintance as the Arctic deer. Before we started on our sledge journey in the spring of 1879—that is from the time we had landed among the Esquimaux, my own party and hired hunters had killed between three and four hundred. On the sledge trip we secured five hundred and twenty-five, and after our return to Hudson's Bay, many animals were added to this already enormous score. On the sledge trip, probably three-fourths of our subsistence (including the month's supply of civilized food taken along) was derived from the reindeer, whose habits were taken advantage of as much as possible by following them to the north in the spring, and keeping them with us on their southward migration as we returned on the same course during the autumn months and winter.

Shortly after arrival in North Hudson's Bay, in the early part of August, 1878, Colonel Gilder became our pioneer in inland hunting and camping. The loneliness of the place after the Esquimaux had left the vicinity of our camp upon their annual autumn reindeer hunts, and a desire to kill some of the many reindeer reported so thick north of our habitation, induced him to turn in that direction with two young Inuit boys, hoping to find a large herd of reindeer meat to sell, or rather trade, for powder, caps and balls. The little party started about noon on the 25th of August, and Colonel Gilder returned home late at night on Sept. 1, during a heavy storm of snow, very hungry and very tired. He had been living for the last three or four days on native diet—raw reindeer meat and wild berries—having injudiciously shared his civilized provisions too generously with his native companions, and had brought us the first sight of a Nimrod, would give him an early opportunity to kill his coveted reindeer, when he could return in triumph to Arctic Rome. But, alas for hopes based on Esquimaux generosity. A few scattered reindeer were seen, but it was a wild foot race, with every man for himself, in which the unpracticed Caucasian stood a poor chance in the contest over razor-edged moose-horn harpoon heads, wet, spongy moss, and other equally severe impediments.

The cold snap at the end of October commenced by bringing the scattered native hunters to erect their winter quarters of snow and ice houses, and our little camp so long nearly deserted, began to assume a very lively aspect. A summation of the autumn's hunting showed that between 400 and 500 reindeer had been killed by all the natives that would make their quarters with us that winter, so that we felt relieved of all anxiety in regard to a winter's supply of the very best of all Arctic meat, and a plentiful supply of reindeer skins for winter clothing and bedding. And these latter were of the very best quality, for the reindeer skins secured in the month of October are superior to those taken later in the year, the hair being less liable to come out, and not so heavy as to render the clothing impliable. After January the reindeer skins of this season are worthless, owing to the readiness with which the hair comes out; and are thrown away by the native hunter, they having no use for the skins whatever, except so far as they hold a useful amount of fur on them. During this part of the winter they are fed to the dogs, should the latter be hungry enough to want them, and probably one in five or ten thousand is tanned of its hair and made into their *kas-luk-thas* or drums for singing and religious ceremonies. The skins are worthless, owing to the fact, I think, from the summer coat, as the loss of that of the winter does not commence until spring and lasts nearly through the summer. In short, I think the reindeer sheds twice annually, the lengths of both periods being much longer than in the temperate regions, and almost overlapping each other. About the middle of August, when all the winter hair has shed, the short summer coat is in its prime, and from the back, all the native underclothing, or that which is worn with the hair toward the body. From the middle of September until the first or middle of October, the skins are valuable for outside clothing (worn hair side out) and for bedding, and after this date they steadily deteriorate, but are still used to place beneath the bed until January, when the hair readily pulls out and they are no longer saved. At all times the skins of reindeer are preferred to those of caribou, and the late autumn *kas-luk-thas* are very highly prized, as they make an exceedingly fine, soft suit of underclothing, especially for their children, to whom this people are fondly attached, and who always receive the best at their disposal.

When the white man has come entirely "at home" in this clothing and accustomed to life in the native *igloos*, or snowhouses, the matter of temperature alone, however, is all that he has to contend with, and he is not at all prepared for it, as he has been told of so often by previous Arctic travelers that it would be a superfluous burden on your time to describe it here. The utility of the *igloo* and reindeer clothing can not be exaggerated. Habituated as my party of four white men were, during our two winters in these desolate zones, to a constant life in these simple habitations, and the many comforts securing therefrom, I often marvel at those who could stand the distresses and oftentimes even dangers of a spring tent life on the many expeditions wherein tents were used. I have read so often of their sufferings while living in this manner and dressed in clothing made from the furs of the temperate zone, under circumstances that to my party would have been absolutely beyond pleasure and of discomfort when even housed in ships, and the perils they risked in short daily journeys from these abodes during such intense low temperatures—30°—40°—60°—and even 70° Fahrenheit, when, under the same circumstances, my party was prosecuting a sledge journey, with no discomfort, 400 to 500 miles from its depot, with no provisions except such game as was killed from day to day, the conviction becomes two-edged that the accessories of *igloos* and reindeer clothing are essential to a well-managed Arctic sledge journey. With their help the subject of the intensity of cold, strange as it may seem, becomes of secondary importance, and if it was not for the long dark night which accompanies the season of these depressions of temperature, a winter sledge journey could be carried forward in any part of the Arctic appropriate for it with no small chance of success.

And now a word in regard to this Esquimaux reindeer clothing. The native has two suits of it, an outer one with

the hair turned outward, and an inner one with the hair turned toward the body. This is true of the coat, pants and stockings. With the exception that the inner suit is generally finer and softer fur, being made from fawn skins or doe skins, secured earlier in the season, there is no essential difference in the two suits; in fact, by reversing either, it may be used as a substitute for the other.

In the latter part of December, I made a short sledge journey due north about thirty miles, to see if I could get through the high hills known to exist between Hudson's Bay and Wager River. I took only Too-looah's family and a Netschilluk young man, Mitkoilluk, and expected to be gone a couple of weeks, leaving December 22 in a severe snowstorm, which lasted four days. We pushed on, however, on our sledge journey, January 1 being the first fine day we had, and the rare New Year's treat was, after so much dreary dismal weather. Hoping that the day was prophetic of the coming year, I pushed on with light heart, but after all only succeeded in making some ten miles, owing to our having seen reindeer, which it is impossible to prevent an Esquimaux from attempting to kill after they have once laid eyes upon them. Thus an hour or two were lost, and when the day is but a couple of hours in length this becomes of impossible importance. Too-looah and his family, at night at one of his former *igloos*, built while reindeer hunting, and where he had cached some four or five carcasses of reindeer. The Esquimaux *cache*, or meat cache, is built of loose, heavy stones, before the snow becomes deep or solid by freezing, and of that material afterward, with the addition of plenty of water to form a protecting cover of ice to prevent the depredations of wolves and wolverines, preventing their scratching through, and also killing the scent which allures them to the place.

On the 8th of January, having satisfied myself that I could find a practicable route by this way to the Wager River, I started homeward, but feeling somewhat disappointed that I had seen no recent sign of musk-oxen, reported by the natives to be abundant in this locality. Their huge carcasses, compared with that of the reindeer, makes them a more reliable source of food, and a larger supply of meat. I saw the reindeer, and this was a very important item in my forthcoming sledge expedition.

I reached home on the 13th, the coldest weather I experienced on the trip being on the 13th, when about two hours before sunrise, the thermometer indicated—53° F. That day I made a journey of twenty-five miles, riding most of the way on the sledge, and at no time during that day did I feel uncomfortable in the coldest weather which I felt from—30° F.; and I might here say that I really enjoyed the whole trip. I attribute this almost wholly to the Esquimaux reindeer clothing and constant living in a snow *igloo* like the natives, where the temperature is never above freezing and generally ten to fifteen degrees below that point. I do not believe—and my belief is confirmed by the written accounts of others—that any Arctic voyagers, housed in warm ships as our last was, could stand the usual Arctic winter so comfortably as I could stand such a journey without more or less material discomfort.

Once only did I learn the lesson of caution. I took off my right mitten in attempting to get a shot at a passing reindeer, the wind blowing stiffly in my face, and the thermometer—37° F. when the persistent refusal of the frozen gunlock to work, and the fact that although I felt from the cold, I had intended. When I attempted to use it again, it seemed paralyzed, and looking at it, I noticed that the skin was as white as marble. Too-looah, who was beside me, noticed it at the same time, and with an Inuit exclamation of surprise, hastily doling both his mittens, grasped it between his warm hands, and then held it against his warmer body under his *coo-ke-tah*, or Esquimaux coat. It soon resumed its life, and I thought, when I felt from the cold, I was holding on to a hornet's nest. I experienced no more serious results than a couple of ugly looking blisters where the iron of the gun had come in contact with the bare hand. The reindeer escaped.

As the reindeer clothing is the warmest in the Arctic, so it makes the warmest bedding, two large skins made into a long coffin-like bag or sack, the hair side in, being a sufficient protection in the coldest weather which I felt from, when I was in the *igloo*. When the first severe cold came in North Hudson's Bay, I was sleeping under a blanket and two fine buffalo robes, which I found as the thermometer sank below—30° to—40° F. to be inadequate to secure comfort, until I procured a reindeer sleeping bag, weighing not half as much, after which cold nights were no longer dreaded. The robe of the American bison seems under the least provocation to become damp, and the dampness is apt to catch a piece of skin, and so spoiled in this manner, it is difficult to dry it and restore it to its former pliability in the low temperature of an *igloo*. The furs of the beaver and muskrat I found to be equally unsuitable in our mode of life, and I believe that all the other furs of the temperate zone would have shared the same opinion if tested in the same practical way.

I have said in my former articles that we started on our main sledge journey of the expedition with a piece of seal skin, in the shape of the 4th we had the cheering sight of a small herd of reindeer, although none were secured, owing to the barking of the dogs, but next day we were more fortunate, Too-looah killing two and Joe Eberling one out of a small band. All through the month of April our larder was constantly replenished by a fair supply of reindeer, which allowed us to save our civilized provisions and giving them a chance to disappear before they had time to grow stale. One spoiled in this manner, so that the latter would not be forced upon us as a repulsive novelty. Our breakfasts consisted mainly of boiled reindeer meat, some three or four pounds to each adult, followed by the heavy soup that was thus derived, thickened by a few crumbs of hard bread. Our suppers were the same, prefaced, however, by a good, generous supply of frozen reindeer meat, which we ate while we were washing our faces and hands in a piece of seal skin which was cut off with a hatchet into chunks about the size of the three fingers and then generally mashed by the back of the hatchet to convert it into brashy shreds before being chewed. The first effect upon taking this into the mouth is to chill one through, often making the teeth chatter, but the reaction is rapid, and followed by a genial warmth all over the body, especially if a generous supply of the frozen reindeer meat is taken, and then a piece of seal skin which is always the case if we have it. Freezing may be said to be one method of cooking, and reindeer meat thus eaten tastes not unlike compressed corned beef without the saltish taste of that article. No attempt was ever made by us to salt it, although we had that necessary condiment along with us. One can soon accustom themselves to it without this when eating frozen meat, reserving it for this cooked in the pot. Seal and walrus meat tastes much saltier

than the reindeer, besides the natives often cook the former in the salt sea water in whole or in part, and in this manner derive all that is necessary to supply them, a quantity which is much less than that used by the cooks of civilization.

[TO BE CONCLUDED.]

## LONG LAKE LOITERINGS.

HEARTILY concur with all Mr. Mather has said in regard to the shooting of deer in the Adirondacks before September 1. I can conceive of no more heartless action than the killing of a doe during the months when her young depend on her for life.

I have listened to the feeble bleat of a young and motherless fawn at midnight, in the still North Woods, my heart full of sympathy for the helpless little creature I could not aid. I have inwardly cursed the mighty "sport" who could do such an inglorious deed as to murder—for murder it is—the mother of the little innocent, and years ago resolved that no act of mine should be the cause of such pitiful misery.

It has been said that one's features are to a certain extent evolved from interior processes. A man who thinks vilely will look vile. A photograph of the man who shoots the mothers of young fawns would betray the face of a snake.

Whoever shoots deer in the months of June, July or August, knows that he is liable to do the wicked things referred to; and the only way to keep clear of it is not to shoot deer at all during those months. A hunter has no business to be in the woods during June and July certainly; if he goes to fish, let that satisfy him. Even by September 1 venison is none too good. What must it be during the months named?

Some of the guides will not allow their patrons to kill deer out of season, but the majority of them give the matter no concern as long as they please those whose money they get. While at Long Lake last season, I had the pleasure of hearing a jury announce a verdict against a fellow who had been shooting deer out of season. It was a flagrant violation of the law, and as there were several unimpeachable witnesses—two ladies among them—it was a clear case. A purse was made up on the spot that more than half paid his fine, and why? Because there were many in that crowd who felt guilty, knowing that they had either killed deer themselves out of season, or knew of those who had, and so, to ease their conscience, chipped in and helped to make the shooting deer out of season as venison. I will not say that all who contributed were guilty, but some were, and it was no secret in the place.

That transaction revealed too much altogether; it revealed a brotherhood of law-breakers. There was one man—a guide—there, however, who showed his spirit as well as principles, and savagely denounced the hypocritical sympathy manifested for the accused. He gave the true state of the case when he asserted, "that those guides who were guilty of similar acts, or who knew of those who were, and did not complain of them, were the worst enemies of the profession, and deserved the ultimate consequences—no employment on account of the extermination of the game." There are men at Long Lake, however—some of them in a judicial capacity—who are clear-headed on this subject, and if they have proper encouragement, will do much to execute the law.

Since I have referred to Long Lake, I will speak of other matters there. Most of the old readers of FOREST AND STREAM have some idea of the place doubtless, while hundreds of others have called there at least. The village is about four miles from the head of the lake, and has two or three hotels and a little church. Yes, and Lysander Hall—the man who stocked, or helped stock that lake with pickerel. Now I am aware that Hall has had much more than his share of cursing. He says he placed the fish there, or, at least, helped do it, and the result has been, that they have afforded hundreds of visitors capital sport for years. The fish well cooked, fresh from the clear waters of the lake, are capital eating. Never have I tasted a more delicious fish than one that Mrs. Sabattis stuffed and baked one day two years ago, when an attack of the sick-headache rendered me altogether unable. The dinner made of that five-pounder (taken by my better-half), made me feel so happy, that my disposition was improved for time and I, hope, for eternity, and I have loved Lysander Hall ever since, and hereby extend my hand in recognition of his valuable services to fish-loving humanity. I have fairly enjoyed hearing him swear, when he put on the gloves and went for his defamers, Mr. Dawson among the number. This was in the early days, and the time when he was as good as an enthusiast, but at the time Hall put the pickerel in that lake, the speckled trout had almost disappeared. So, gentlemen, "let up on" Hall—all your choicest adjectives were exhausted long since—and go for Seth Green, who has introduced fish into some of the waters of the Adirondacks that will rout out the trout faster than Hall's pickerel ever did. Trout may still be had near Long Lake in fair quantities, but as "trout hogs" are all dead, we may expect to see them exterminated ere long. Last season one of these pests took from Fishing Brook, five miles out toward Newcomb, about three hundred in a day, and said that the "sport" of catching those fingerlings amply paid him for his trip from New York. For a consideration invalids who cannot tramp far may obtain permission (this is a supposition only), of lawyer, farmer, blacksmith, merchant, parson and gentleman, Robert Shaw, to fish in his private pond near.

I said before commencing this digression, that Long Lake had three hotels, Mr. Helms keeps a neat and comfortable house, the Kellogg place a short distance from the lake.

Mrs. Kellogg has a new house at the landing, which will accommodate fifty persons, and the post-office is here. The charges are moderate, and the place is very pleasant.

Last year Mr. Srs. Dornburg & Butts erected a spacious lot on one of the most prominent points on the lake, near the village, which will accommodate two hundred guests. The house is built in modern style, four stories high, with French roof, and the rooms are large and pleasant. One of the grandest views in the entire wilderness is had from this house. Looking down the lake, that beautiful sheet of water extends for a dozen miles, while grand old Seward, and other lofty peaks, form an imposing background. One may watch with never-ceasing interest the cloud shadows chase one another along the immense slopes of those ranges, forgetting meanwhile the petty cares that crowd our poor lives in slavish routine down the course of time.

The magnificent outlook from almost every part of this house must of itself attract many visitors. Its interior is first-class, with spacious dining room, large parlors, ample office, and all the adjuncts that make up an attractive and

comfortable house. I am no prophet if the tide of travel does not set thitherward, as it is one of the easiest places to reach in the wilderness. From North Creek—the end of the Adirondack Railroad—the distance is a few miles further than to Blue Mountain Lake; but the road being less hilly, and as good as the other, the journey of forty miles is easily made. If there was a good road between Long and Blue Mountain Lakes, the tide of travel between the two points would be very great—the distance being but nine or ten miles. An extension of the telegraph line from the latter point would largely contribute to such a result. The long journey via the Raquette, through lakes and carries, would then be avoided, to the relief of invalid tourists.

Game may be found in as great a supply in the vicinity of Long Lake as elsewhere, as was amply proved last year. The writer was camped during the month of September, only seven miles out, and had all the venison that any white man ought to kill in that time. Three deer were shot directly in front of the camp, that came in from some quarter not known to us.

While I agree with Mr. Mather, that hounding deer into a lake, and then dispatching them with a bludgeon, or shooting them from a boat, is not the most sportsmanlike method of capturing them, yet at that season it is about the only way they can be had. Later, after the snow has covered the ground, deer may of course be had by stalking; but most camps would see little venison if their capture depended on that manner of hunting. Better jack or night hunting in June and July, and August if you like (although not so many are taken in that way during that month), and allow the use of dogs the rest of the season.

On no account would I favor their slaughter in the way it is commonly done, by killing them while close at hand in the water. Let us shoot at them like men while they are off at fair range, and give them a chance for their lives. The only objection to this would be the inability to main-

tain them, so they would escape and die in the woods. Last year our party killed them at varying distances, from four feet to forty rods, but I never shot at one unless the chances are in his favor at a fair range. I will not, however, agree to do "Nessmuk" says he will—confine himself to a muzzle-loading rifle—and shoot but once, and if not killed, let them go. "Nessmuk" would draw the thing a little finer if he would dispense with a rifle and use a bow and arrow, which would also be lighter for that twelve-pound shell he proposes to use.

Let us shoot the deer in the water. Deer shot in deep water will sink before the fall coat is full grown, and that fact makes it necessary to kill them while close at hand if they are to be killed in the lake. The fairer way is to let them gain the shore, and shoot as they are in the act of springing out of the water. We don't always get them, but who cares, there are more left and we have more fun hunting them. I had a favorite stand on a certain rock last year, and when the poor things came within range, I shot the lake (which was the north Woods). I shot, took careful aim with a twenty-inch Maynard, and let slide. Killed one at that distance and missed two. One bright morning I came a fine buck just opposite, when I threw up the rear sight for forty rods, but for some cause did not fire, but waited until he was reaching the shore not four rods from the spot where we stood. I then blazed away, supposing, of course, that a fresh pair of antlers would make him disappear, but he came back, and he was not there and disappeared from my observation forever. Shot over, of course, with the forty-rod sight up, but felt a little stricken, all the same. Shouldn't have cared so much about it had not "the partner of my toils" saluted me with, "Humph! should think you had shot away lead enough to do better than that. Oh, dear! I could do better myself." I think so might.

Bears abound in the vicinity of Long Lake, and one morning while the guests were breakfasting at Kellogg's, we heard the cry, "A bear! a bear! a real wild bear!" Up we all jumped, and on reaching the door, sure enough there was a shaggy black fellow over on the lake shore sixty rods away. Hearing the commotion, he reared upright, and disappeared in the woods. Dogs were put on trail, while three valiant sportsmen manned a boat and sped down the lake, landed and made for the mountain side where Bruin was expected to be. They were not there. The party retraced their way to the house, happy in the consciousness of having periled their lives for the safety of the people of that sequestered hamlet.

A bear was killed in sight of the hotel thushy: Two men were coming up the lake, and saw the animal swimming; so, having no weapons, they drove him ashore and placed a lot of stones in his boat. Then they pelted him until he again took to the water, when he was not there. The boat and fire were started until he "kerdumaxed."

A guide in search of lost dogs near by encountered a bear and shot him, when another showed himself, which he also killed. A third appeared, which was dispatched, when the man discovered that he had but two cartridges left, and fearing that more might be mousing around there, decamped as fast as his long legs would carry him. Ren Towne, while watching for deer on Slim Pond, killed a bear, or thought he did, until convinced to the contrary. There was some mystery about the affair, as Ren avers that he shot him four times in vital parts, and that the bear lay stone dead on the shore. The writer certainly heard him pumping that Winchester as fast as mortal man could, but never was able to account for the absence of the bear on visiting the spot with his guide.

A fine deer was shot in front of the house as it was going up the lake on the new horse.

From the foregoing it is expected that the readers of FOREST AND STREAM will understand that this writer and sojourner in this vale of tears is interested in the prosperity of the before-mentioned place known as Long Lake. I am; for, like many others, I have been elsewhere, and got—no, not fleeced—but got no game, no fish, no deer, no bear, and no panicles. Here we have all these without city prices. I have invested in no building lots, no banks and no insurance companies at that thriving place, and have no axe to grind—only a little hatchet. Here lives Uncle Mitchell Sabattis, known to thousands all over the Union as a good guide, hunter and friend.

"That reminds me." There is a little church here, and Mitchell, as everybody calls him, has always taken a great interest in it. So good friends, when you tarry over Sunday, don't forget that the little society needs the aid of its friends. A dollar bill looks well in the bottom of a felt hat as it goes around the church in the hands of our friend. Besides, you will have the reputation of being rich, and it can't be got cheaper. Rev. John Todd, who used to come here to hunt and fish thirty years ago, gave the society a good boost, made friends of all the guides, and is held in everlasting veneration in that quarter, and has in all proba-

bility been given a good berth over on the side of the na- tory. He did missionary work, and on his fishing and hunting long before people concerned to blab about the locality, consequently he had a good time. The people of Long Lake are in a fair way to become indebted to another habitué of the wilderness—Mrs. E. W. Crosby, of Albany, N. Y.—who has been laboring for two years to raise the necessary funds to establish a free library for the guides.

She has already about half of the amount that will be required to carry out the project, and its early completion is anticipated. There are many intelligent people there who will patronize the enterprise for themselves and families, whose means do not enable them to procure all the books they would like. Any contribution of books or money may be sent to her, and will be promptly acknowledged. The old-school people there do not care for the latest phase of thought, and a clergyman who attempts to give it them will hardly be appreciated. Style and tone, and all the fixings, may be had on the Raquette every summer, but here, religion makes no parade—is dispensed under no particular garb. Last season one of the big guns of Boston conducted the service on a Sunday, and as he was fresh from the woods, and at peace with himself and all the world, was in no mood to give 'em hell, and he didn't. He referred to man's relations to his Maker, and to his spiritual nature, after the method of treatment of such subjects among cultured and well read people, and the sermon was not a success. My guide more than intimated that if that was religion he didn't want it. The scattering of pearls does not always pay, even if they are picked up in the city that has had the benefit of the brains of Phillips, Brooks, Dr. Duryea, Theodore Parker, Emerson, Paige's Hall and Murray. TEXNIS.

RIVINGTON, Conn., Jan. 22, 1888.

## AROUND THE COAST OF FLORIDA.

BY DR. J. A. HENSHALL.

Second Paper.

AILING out of San Sebastian River into Indian River, a break in the coast line opposite can be seen, which is the beginning of an attempt by the settlers in the vicinity to cut an inlet to the sea. Four or five miles below the mouth of San Sebastian we came to Pelican Point, and on our way out of a group some eight miles in extent, forming Indian River Narrows. For two years the pelicans had ceased breeding on this island, owing to their being continually harassed and wantonly and mercilessly shot by Northern tourists. This year they were again nesting and we paid them a quite visit.

On our approach the pelicans hovered uneasily around, while a rookery of egrets, cormorants and man-o-war hawks on a small mangrove island adjacent, saw some of great excitement and commotion. We anchored the schooner several hundred yards away and landed in the small boats. The dead and stunted mangrove trees and the ground of the entire island, of an acre or two, were literally covered by the nests of brown pelicans. Those on the mangroves were rude, flat affairs formed of sticks, those on the ground often consisted of but a handful or two of grass or rushes, while many eggs were lying on the ground. In some nests there would be an egg, a newly-hatched, naked, purplish-red pelican, and on four times the size sparsely covered with a yellowish-white down. This occurred so often as to attract my particular attention. There were usually two or three eggs or young to a nest. The young pelicans kept up a continual screaming and screeching as we approached them, darting out their long bills and opening their mouths, uttering a cry that sounded very like "go-w-a-a-a-a." Some of them, however, were incapable of sound or motion, being literally "too full for utterance." It was very comical to see them sitting solemnly in their nakedness, their bills elevated vertically, with the tail of a fish sticking out and pointing heavenward. Pulling out some of these fish I found them sometimes twice the length of the young bird, bill and all, the lower or head-half of the fish being entirely digested. And thus they sat for hours in a state of perfect helplessness. In some instances, however, the young bird, having, owing to the process of digestion going on, at the lower end, grown smaller by degrees and beautifully less.

I had always been under the impression that the pelican fed its young entirely on digested or macerated fish, but whatever may be the habit of the white pelican in this particular, the brown pelican certainly feeds fresh fish to some of its young which have arrived at the dignity of a downy vestment.

Most of the young had been fed macerated or digested fish, but some of the older ones had fish in their throats no many minutes out of the water, which were usually needle fish (*Henirbanus unipunctatus*) and mullets (*Mytilus*). Some of the old birds, seeing our intentions were honorable and peaceable, remained on their nests within a few yards of us, but most of them took to the water, where they were gracefully swimming by hundreds, near the shore. The pelican, considering its large size and ungainly appearance, is remarkably graceful on the wing or in the water; this is to be accounted for by the fact that the cellular tissue between its skin and body is distended by air, instead of fat as in most other animals, thus giving it great buoyancy. Taking a few fresh eggs from the ground, we relieved the anxiety of the parent birds by taking our departure.

Passing through the Narrows, we stopped awhile to visit old Capt. Estes, a noted hunter, who has lived alone in and about the foot of the Narrows for nearly thirty years. We found him laid up with the rheumatism in his palmist shanty; a fire blazing in a huge iron kettle sunk in the floor lit up the sombre interior, the smoke finding its exit through openings along the ridge-pole. The old man's slumbers had of late been much disturbed by dreams of encounters with bears, printers and Indians, and on some occasions when sorely oppressed, he would utter his rheumatic limbs, dashed head first through the mosquito bar around his bed, which, in consequence, was a mass of patches. In the shanty were many trophies of his prowess. Among others, the skull and skin of a large manatee, also a large rope net used in the capture of these curious animals. Capt. Estes took two live manatees to Philadelphia during the Centennial Exposition, but which, unfortunately, were burned in the fire that occurred opposite the main entrance the night of the first day the fair was open on Exhibition Week. Within a mile of Estes's shanty is United States Life Saving Station No. 1, on the sea beach.

On the mainland, at the foot of the Narrows, is an extensive marsh covered by low shrubs and bushes, and intersected by numerous creeks, which is the breeding and roosting ground of innumerable gulls. Toward night they may be seen flying over by hundreds. This gannet is a

large bird, nearly as big as a goose, but flies and swims gracefully and swiftly. It is, like the pelican, is remarkable for the pumacity of its body. Like the pelican, also, it has a gular sac, though a small one.

About ten miles below the Narrows, and nearly opposite Fort Capron, we entered Gardiner's Cut, at the entrance to which was the turtle camp of Arthur Park and Jim Russell, and a mile further on we anchored in Pinkham's Cove, near the sea beach, and just above Indian River Inlet. After a ramble on the ocean beach, where we saw half a dozen immense blackish stranded, we gathered several barrels of oysters, fished to our heart's content, and shot a number of curlew and bay snipe. Toward evening we were driven away by the sandflies. Making sail we crossed the inlet and entered the Fort Pierce Cut. Here we encountered a school of porpoises and a number of large tarpon (*Megolops atlanticus*), the latter being from six to eight feet in length. As they rolled out on the surface their bright armor of silver scales, as large as silver dollars, shone resplendent in the slanting rays of the setting sun. Jack was trolling and expressed a great desire to hook one, but it was well enough he didn't, for he might as well have been fast to a steam tug. We crossed over to Fort Pierce, on the mainland, four miles below Fort Capron, and dropped the anchor about dark, after a rather long and weary day, in which blew his guns, but the Rambler did it like a duck.

We went ashore at Fort Pierce to chat with Ben Hogg, who keeps a store at that place. Ben has a monopoly of the Indian trade in Southeast Florida, and buys their deer hides, gator teeth and beeswax. A party of Indians from the Everglades were then hunting back in the flat woods, their canoes being drawn up on the shore in front of the store. Ben has a good-looking sloop in which he carries several tons of goods to Jacksonville, and calls at the inlet opposite, leaving his guide wife and boys to tend store in his absence.

A few miles below Fort Pierce we stopped at Hermann's Grove for a supply of sour oranges for culinary purposes, sour orange juice and soda being superior to baking powder in the construction of the mysterious but gustatory flapjack. The old grove was formerly founded by a tree bearing sweet orange on sour or wild stocks, but the trees having been burnt down to the stumps, the new growth, of course, produces only wild, or sour and bitter-sweet oranges. Below this, and about seven miles above the mouth of St. Lucie River, Mr. Richards has built a large house and has quite a clearing planted to oranges and pineapples. Nearly opposite, on the east shore, can be seen the hamak once owned by "Old Cuba," the first of a newly-arrived young man, who was drowned by the capsizing of his boat, and when found his body was headless. Four miles below Cuba's is U. S. Life Saving Station No. 2, opposite the mouth of the St. Lucie. A few miles below Richards's we came to Waveland, a new post-office at the residence of Dr. Baker, who has a good hamak lying between Indian and St. Lucie rivers.

At the mouth of St. Lucie, as usual, were thousands of coots and many ducks; we got a good supply as we sailed along. The St. Lucie, from its mouth to the main fork, some eight miles, is a large river whose waters are entirely fresh; it divides into a north and south branch. We sailed up to the main fork, seeing several manatees on the way. As we passed Mt. Pisgah, a high ridge on the northeast shore, whose bare summit is crowned by an ancient mound, we saw in its foot the tent of a newly-arrived young man, and his wife, from Philadelphia, who had bought a piece of land without seeing it, and found it to be located on the bald top of Mt. Pisgah.

The wind being favorable, we sailed up the south fork some four miles, being altogether about twelve miles from the mouth. Here we moored the schooner for a camp of several days, and had fine sport, there being an abundance of deer, turkeys, and quail.

One morning I entered a clump of bushes near a spruce-pine thicket, where I had seen some turkeys the day before, and began calling, or "keouking," with the intention of enticing some old gobbler within range. Just outside of the clump of shrubbery was a large bare space of white sand, which I had examined carefully for deer or turkey tracks before concealing myself. After a half-hour's fruitless endeavor I came out, and was surprised to find the tracks of the fresh track of a large panther, who had approached within six feet of where I was concealed. He evidently mistook my efforts at "keouking" for the complainings or agonizing cries of some turkey in sore distress, and thought to make a meal of it, but seeing me, he beat a hasty retreat, for his tracks led to and fro between the thicket and my hiding place.

One day I had perforated and blown some pelican eggs, and left them in a shallow box on deck to dry, when all hands went hunting. We returned after a few hours with a fine buck and some turkey. As I stepped aboard I noticed that one of the eggs was missing. Going toward the stern I found it on a coil of rope, and on picking it up, a fish-crow, sitting on a limb of a pine tree to which the bowline was made fast, uttered a hoarse and mischievous "caw, caw, caw," seeming to say:

"Ah, you black rascal, you found it too light for sucking and dropped it, didn't you?" said I, shaking my fist at him.

"Caw, caw, caw," he laughed derisively, as he flew away.

The fishcrows are comical fellows, but very impudent and audacious. Some thirty-five years ago, when Squire Charley Moore of Lake Worth was a younger man, he was engaged in wrecking on the Florida coast. He and his comrades used to rendezvous and camp at the lower end of the lake of Lake Worth, which was separated from the ocean by a narrow timbered ridge, some two hundred yards wide, known as the "haulover." Anything of value found on the beach was conveyed across the haulover to the lake, where it was safe from observation, as the existence of a lake twenty miles long would not be suspected from the beach. The fishcrows hopped around the camp like barnyard fowls, picking up bits of corn and other scraps of refuse table of the wreckers. There was one crow that had lost a leg in some manner, who was made an especial pet on account of his misfortune, and in consequence became quite tame, feeding royally at the bounty of his friends, and to the great envy of his sable companions. But he was a great rogue. Like Silas Wegg, he stumped his way into the stations of his patrons, at amusements, and by his grotesque antics and hoarse croaking, and like the indomitable Silas, insisting on double rations for "mellowing the voice." He became very familiar, hopping over the feet of the men for the tid-bits dropped to him; but his familiarity, as usual, bred contempt, and, like Silas again, he became aggressive and exacting, snatching food from hands that fain would have caressed him. As it was about the time of the Mexi-

can war, the wreckers, naturally, named him "Santa Anna." Whenever they returned to their camp on Lake Worth Santa Anna and his companions were sure to be on hand. On one occasion they repaired to the lake after an unusually lucky expedition down the coast, but Santa Anna failed to put in an appearance on the first day; the other crows were there, but kept a respectful distance as was their wont. The second day came and passed, but with no appearance of Santa Anna. Then the men lamented him for the first time. But the next day, while at dinner, beheld the recent Santa! He hopped about on his one leg in a very stiff, awkward and painful manner, and withal seemed unusually shy and humble.

"He has been sick," said the men, "and has not quite recovered his strength."

"He don't look like himself, at all," said Charley, "he is thinner, and not so sleek and noisy; but he'll be all right in a few days. I once had a parrot that acted just that way, when sick."

"He's got a wonderful appetite for a sick bird!" said one of the men, as Santa gobbed the fragments of bread, bacon, fish, venison and sweet potatoes; for the men, in their youth, had heard of the fatted calf, and were very lavish with their grub, which they bestowed with cumulative hands on the returned prodigal. But there is a limit to which the prodigal can go, and Santa's appetite was not an exception. Santa was filled to repletion. He made several ineffectual attempts to take flight, but his one poor leg was not sufficient or strong enough to give his overloaded body the upward boost required to enable his wings to come into play. He was weighed down with prog, like Mark Twain's jumping frog, with shot.

"Poor bird!" said the men, "he is very weak, quite ill." But *mirabile dictu!* "Poor Santa!" was seen, and put down a second leg, which had been artfully drawn up and concealed, and then, by the combined effort of two good legs, and a quick preliminary squawk, accompanied by a hurried and contumacious "caw, caw!" he bounded upward with an "initial velocity" that would have gladdened the heart of a rifleman.

The black panther looked at his neighbor, wistfully and expectantly, but being a foreigner, he said, "No one felt equal to the task. No one could do the subject justice. Alas! Santa Anna was dead, indeed; but worse than all, their hospitality imposed upon, and their affections outraged by the duplicity and usurpation of an infamous, dissembling and fraudulent fish-crow."

The black bass fishing of the St. Lucie cannot be surpassed any place in Florida, and for that matter, in the United States. Their numbers are legion and their size monstrous. We caught them from two to fourteen pounds, the catch usually averaging five pounds. The boys, especially Buck, never seemed to tire of the exciting sport, of course throwing most of them back as soon as caught, when they were ready to bite again; for it was cut and come again with these voracious and gummy large-mouthed bass; gummy, indeed, as those of any other waters, though, on account of the general sluggish current of these rivers, they are sooner lured. Fish in fresh water seem to be endowed with more vigorous and lasting fighting powers, but which is really to be attributed to the force of the current, which aids them materially in their opposing and staying qualities.

At night the favorite sport of the boys was shark-fishing; and even at this remote camp, though fully twelve miles from the shore, they caught many small sharks. On one occasion they hooked and landed an immense soft-shelled turtle (*Tryonichide*), whose carapace was nearly three feet long; he made a good pot of soup, and furnished some palatable steaks.

With a favorable wind we left St. Lucie camp and proceeded down the river, seeing several more manatees or sea-cows, in the main stream, with one of which we had an exciting race for a short distance as he swam a few yards ahead, but was forced to make for the grassy bottom as the bow of the schooner touched him. They swim very swiftly for so unwieldy an animal, but make much fuss about it, leaving a wake as large as a steam tug. Sailing down Indian River we soon came to Jupiter Narrows, near the head of which is a close inlet, Gilbert's Bar; there was some talk of reopening this inlet, but the captain, Mr. Sperry, says, "No." On one occasion they hooked and landed an immense soft-shelled turtle (*Tryonichide*), whose carapace was nearly three feet long; he made a good pot of soup, and furnished some palatable steaks.

At Jupiter we found several parties of tourists; among others, Major Macrea and some of Philadelphia; Dr. Sweet of New Bedford, Mass.; W. E. Sperry, of Chicago, Ill.; the Kellogg of Fall River, Mass.; and Mr. Clark, of Maine. Dr. Sweet had a whaling harpoon in his boat, and had some famous sport harpooning sharks and sawfish. Mr. James Armour is still chief keeper of Jupiter light, his assistants being Messrs. Spencer and Carlisle. He was very courteous during our sojourn, and twice he and Mr. Carlisle hunted with us their hounds, but the Indians had made the deer wild; turkeys, however, were plentiful enough. The boys and two narrow wags with his life while we were there: A ride in the hands of an inexperienced person was accidentally discharged, the bullet just missing him; and in the afternoon, while descending from the dome of the lantern (a hundred feet from the ground), on an iron ladder which rested on the railing of the balcony surrounding the lantern, the rail broke as he set his foot on it. A less cool-headed man than Mr. Carlisle would have been dashed to the ground, but he is noted for intrepidity and level-headedness.

The boys had many a fierce contest with the large sharks and sawfish at Jupiter, catching many white and blue sharks from six to twelve feet long. Their shark fishing was always practiced at night, they being engaged in other sports and adventures during the day. These sharks are formidable monsters, and are very dangerous to man. They are found along their edges, and which, being encased in cartilaginous sockets, can be erected or depressed at will. With one snap they can take off the leg of a man as clean as the sickle of a mower can decapitate a quail. While the boys were playing a small shark, I have seen a larger one sever it completely in twain at one bite; and I have seen a piece as large as a shark's jaws taken out of the body of a man, and the man himself was not hurt, but cut from the maw with a sharp knife. As it is considered how tough and unyielding is the skin or shagreen of a shark, the power of his jaws and the sharpness of his teeth can be imagined.

One night the boys tackled a foe worthy of their steel in a huge jewfish, or black grouper (*Epinephelus nigritus*). It took all hands to land it, and, as in the case of the sharks, a rifle ball through the head to quiet it. The next morning

Mr. Armour weighed it on his steelyard, which it balanced at three hundred and forty pounds. The shark tackle consisted of three hundred feet of half-inch manilla rope, and immense long-shanked shark hooks with chain and swivel attached. Some central-drift short-shanked hooks were completely straightened, proving that there are frauds in shark hooks as well as in fish hooks.

At Jupiter, Buck left us, to our great regret, being compelled to return to Texas on business, for it was now the middle of February. He took passage with Capt. Hammon for Titusville, and on his sharpie rounded into Indian River, and waded our pleasant comrade an adieu with a little semblance of glee, but our hearts were heavy as he left, for Buck was a genial companion, a good shot, an enthusiastic angler, and a life-long hunter. As the boat passed from view around the bluff, Jack exclaimed:

"Forever, and for ever, farewell, Cassius."

If we do meet again, why, we shall smile;

If not, why, then this parting was well made."

There was no shark fishing that night, and the boys turned in early. The next day we went out over Jupiter Bar at high water slack, and with a head wind, consequently we had to use the poles in getting out. There was a heavy swell but not much sea, and with a light easterly breeze we made Lake, and in a few miles below it, in a little less than three hours. We ran the inlet about half way, but there not being wind enough to stem the strong ebb, we anchored until the turn of the tide. Lake Worth inlet has increased in depth to about seven feet at low water, and withal is much straighter than at its former view. With the young flood we entered the lake, and at once sailed down some six miles to the house of Squire Charley Moore, whom we found as kind and friendly as our new location, and vastly improved, a post office was established, new settlers were coming in, and all seemed prosperous. Two schooners were running to Jacksonville, carrying tomatoes, bananas, pineapples, etc., which, with the boats running to Rockledge and Titusville, afforded good transportation.

The next day we sailed down the lake to the residence of E. M. and John Brelsford, formerly of Xenia, Ohio, who seemed to be well pleased with their new location, and were living comfortably in their tropical home, which was doubly blessed by the presence of their charming mother and lovely sister who were spending the winter with them. We took tea with them, and afterward we all repaired to Capt. Dimmick's, where we passed a most agreeable evening, one very enjoyable feature being an impromptu concert by the Brelsford family, singing, playing violin, guitar, and cabinet organ. Jack, Squire Moore, and the Skipper all took part, and on this occasion, and in order to keep peace among the boys, and to preserve a proper state of discipline aboard the Rambler, I deemed it imperative to take our leave the next morning.

## UP AND DOWN IN COLORADO.

BY HENRY L. ZIEGENFUS, RECTOR OF CHRIST CHURCH, POCONOKEE, N. Y.

WE have heard much of the wearisome monotony of the plains, and of their caustic alkali, but we found both largely mythical. Well sheltered and well fed in the sumptuous sleepers of the Chicago, Burlington & Quincy Railroad, we passed through the rich, fertile Lincoln and Red Cloud country, with stretches of rolling land covered with thrifty villages, with almost endless fields of corn and wheat, or with that rich, succulent grass on which vast herds of horses and cattle browse freely in winter as well as in summer. The soil is so exceedingly fertile that abundant crops are the inevitable result of skillful irrigation. More wealth will yet be gathered from the "Great American Desert" than can ever be dug out of those mountains so rich in precious metals.

Leaving the Missouri in the forenoon, the next morning found us in Denver. In the year 1870 it had a population of 4,759; at this date it is generally conceded that the Queen City of the Plains contains at least 65,000 inhabitants. It is regularly built, principally of brick and stone, along wide, densely-shaded avenues. In the central portion of the city are blocks of magnificent buildings, mostly devoted to business, and many more are constantly being added. The electric light turns night into day; tramways, Herdic coaches and the telephone bring distant points into close contact; numerous schools and twenty-five or thirty churches are scattered here and there. Of periodicals there are about twenty. The *Republican*, *News* and *Tribune* are published every day in the year. The eight-page morning *Post* is published twice a week, and sixteen times a week, and give constant evidence of ability, enterprise and undoubted prosperity. The *World* and the *Times* are bright stars of the evening. The *Great West*, a spy weekly, is published under the editorship of "Brick" Pomeroy.

The city can boast of gas and water works, of the steam heating system, of a rolling mill, of seven banks, of a \$200,000 smelter, a \$250,000 hotel, a \$250,000 city hall, a permanent exhibition building 300 feet in length, a \$250,000 hotel, a government building, for which there is, so far, an appropriation of \$300,000, a union depot 503 feet in length, erected at a cost of \$150,000, and a \$700,000 opera house, which, in internal finish and appointments, is unsurpassed by any similar structure between the Atlantic and the Pacific. In spite of all this lavish expenditure the debt of the city is but a trifle, and the rate of taxation only one and three-eighths per cent, at a fair valuation.

Looking from the heights of Denver westward the eye sweeps along the Rocky Mountains for more than 200 miles. Eastward the rolling grazing lands extend to the Missouri River. That the entire State was originally a grass-covered plain is evident from the fact that on the summits of the various ranges there are generally found the same soil, and the same grass, and the same vegetation, as on the foothills. The uprising of the mountains, at a geologically late date, simply lifted, tilted and folded the rich alluvial deposits of by-gone ages. Barring the underlying and oft outcropping bed formations, the Rocky Mountains are, as a rule, not rocky. Some of their highest elevations are smooth and stoneless as a newly-mown lawn, so that in passing westward from range to range one is again and again reminded of the closely-clipped pasture field of New York or Pennsylvania.

The trip from Denver to Pueblo southward and parallel with the mountains for 120 miles is a fitting preparation for the coming internontane revelations. Castle Rock is passed, and numberless formations of its kind. Lake Palmer on the Divide, with its two highwater outlets, one seeking the Platte and the waters of the Missouri, the other flowing through the Arkansas into the Mississippi. A corner of

Monument Park is traversed, where many-hued sandstone, capped with igneous rock, assumes forms strangely grotesque. The Grand Cañon, Verde and Montezuma, the Santa Ana of the plains, and much more than that in all but folly. One ward by buttes and mesas, through the cattle on a thousand hills, through sage, and cacti, and the homes of prairie dogs, till Pueblo, the great manufacturing center of Colorado, is reached.

For the last hour the Rocky range had been receding toward the West, in which direction we now set our faces, following the Arkansas through a low, wide cañon, over grassy and wooded fertility. We met through the shadows acres of maize, as tall and lush of growth as that on the rich soil of Iowa, through leagues of those diminutive sunflowers, ubiquitous on plain and mountain, through dense groves of cottonwood and large fields of wheat and oats, a very Eden of abundance, until we arrive at Cañon City. Here an observation car is attached to the rear of the train and speedily filled with tourists. We enter a cleft in the mountains, cut down from top to bottom by the ceaseless, age-long toil of those rushing waters. The sides converge more and more, till there is scant room for stream and road bed; higher and higher rise the many-colored, seamed and jagged cliffs; closer and closer, higher and ever higher, till the wonder of the Grand Cañon ends in the amaze of the Royal Gorge.

There is but scant room for the angry stream which roars and surges between the narrow rock walls, the lift comes straight up for more than half a mile. From river bed to pinnacle tip the distance is over three thousand feet. Over a bridge suspended from iron trusses mortised in the rock overhead, and following the stream lengthwise for ten rods or more, we pass the narrowest point, but thirty feet wide, and thus through grandeur indescribable ascend to Salida, ninety-six miles from Pueblo.

A bounding mountain chain that is destined for Leadville in the north, we take one that is headed in a westerly direction, and soon cross Poncho Pass, noted for its hot springs, its scenic attractions, and the abundance of its trout.

From Mears, eleven miles beyond Salida, the ascent toward Marshall Pass is extremely rapid, the grade being frequently two hundred and eleven feet to the mile. The road climbs up on one side of a valley, makes a turn at the end of it, and ascends the other side; then, rounding a projecting spur, it reaches the process at last, the summit is reached, at an altitude of 10,858 feet above the level of the sea. The direct distance from Mears to the summit is hardly more than five miles, but the curves and lapings of the road cover no less than fifteen miles. The time consumed is one hour and thirty-eight minutes.

The outlook is magnificent. On either side slope down valleys for thousands of feet. Above us rises the peak of Mt. Ouray, so bare and snowed and grass-covered that a child, delicately shod, could make the ascent with the greatest ease, so far as the overcoming of obstacles is concerned; but let the "underfoot" not rashly attempt it, for such is the rarity of the atmosphere, that breathlessness and throbbing temples are the usual results of the slightest physical effort.

In descending we curve down along well-embowered mountain sides, through beautiful valleys, along trail and streams of crystal clearness, over meadows and river bottoms, dotted with ranches, saw-mills and hamlets, till finally we enter a wide open plateau, and far in the distance catch our first glimpse of the city of Gunnison.

The town, with its five or six thousand inhabitants, is the capital of a county that is larger than Massachusetts and Rhode Island taken together. Along its wide and regular streets are the most inviolable and magnificent. Beautiful structures of stone and brick indicate stability and prosperity and confidence as to the future. There are numerous schools, five or six churches, a fine court house, several excellent hotels, two banks, gas and water works, and two more than usually alert daily newspapers. There are now in course of construction a large smelter and a hotel that is to cost \$125,000. Situated as Gunnison is at the confluence of the main mountain ranges, and by the mouth of the exceedingly fertile Uncompaggre Valley, surrounded by rich deposits of iron and anthracite coal, and by such flourishing mining towns as Ruby, Gothic, Crested Butte, Tin Cup, Tonic and Pitkin, there can be no doubt that it is destined to become the most populous and affluent city in Colorado west of the Divide.

From Gunnison we took the train for Cimarron, which in August last was at the end of the track. For about twenty miles our course lay down through the valley of the Gunnison. As advance was made the scenery became more and more picturesque. On our right were rare specimens of nature's carving—monuments, pyramids, minarets, broad domes, tall, sharp spires, and lofty castellated heights of all hues and magnitudes, until we entered the rock portals of the Black Cañon.

The tireless water has here also done marvelous work. On our left, across the stream, rise up steeply well-wooded acclivities thousands of feet in height, while on our right cliffs high as those of the Royal Gorge lift themselves skyward and darken this tortuous chasm. Fifteen miles of unvaried grandeur, a little stream is crossed, and we halt at Cimarron, a typical end-of-track town. It was near midnight when we arrived, yet the entire place seemed as if lights glimmered through every canvas. There were tents only, yet no lack there of offices and shops and hotels and saloons and noisy dance-houses. As we lay on our improvised beds in the passenger coach, across the noisy Cimarron and through the darkness came the irritating notes of a French horn, shrill misery from a violin, and the sharp calling-off of a female blest with painfully stridentulous voice. Into our very dreams that musical torment wormed itself. It was night long to be remembered, that first night at Cimarron.

From the latter place the Denver & Rio Grande is rapidly extending its track westward. Before the end of January next it is expected that Salt Lake City will be reached, and that by co-operating with the Central Pacific in the West and with the Chicago, Burlington & Quincy, and with the Atchison, Topeka & Santa Fe in the East, the Denver & Rio Grande will become an important link in a new and most attractive transcontinental railway chain. It will not be long before this enterprising corporation will have no less than seventeen hundred miles of all-steel track in full operation.

As the tourist is carefully transferred over higher than Alpine passes, and whirled along steep slopes where even the venturesome mountain sheep never found a footing, or through gorges whose lowest depths of darkness the eyes of man never penetrated, in cannot help admiring the skill, the patience, the liberality, and the heroism so displayed. In

his excellent manual, "Health, Wealth, and Pleasure in Colorado and New Mexico," Mr. F. C. Xmas, of Denver, tells how in the Royal Gorge, and in other places like it, "Men and tools, and mules and carriages were let down over the precipices by ropes, and men and animals received their food, like Elijah, from above, till they cut a track through the granite cliffs; how the surveyors first picked their way through the cañon on the ice, where before only fishes and birds had been; how the rockmen hung suspended in the air, and drilled holes in the granite for blasts that sent tons of rock crashing into the stream, with a noise louder than thunder."

By supplanting the stages and pack trains of burros, the Denver and Rio Grande Railway has been a most important factor in making Colorado the rich State that it is to-day. Into every mining camp that is worthy of consideration, and in any way accessible, branches of the road have been extended or are now being so advanced. In the Leadville region it is tapping such towns as Red Cliff, Dillon, Frisco and Breckenridge, ascending at Summit an altitude of 11,329 feet; in the Gunnison region, Crested Butte, Ouray, and Lake City; in the Salida region, Mayville, Bonanza, Bismark, and Saguache; from the Cañon of the Arkansas, Silver Cliff, Rosita, and numerous coal mines; and in the south, El Moro, Del Norte, Wagon-wheel Gap, and the New Mexican Espanola—the richest portions of the State being thus nourished and strengthened by these life-giving arteries of traffic. Well worthy are these men of our admiration, and of the \$800,000 that they are earning every month.

From Cimarron we return to Salida, and after a delightful wandering through Brown's Cañon, along the base of such peaks as Harvard, Yale, and Princeton, each more than 14,000 feet in height, Leadville is reached, the city above the clouds, with its fifteen thousand inhabitants, and its altitude of 10,200 feet. We knew that during the past year Leadville had produced precious metals to the value of more than \$16,000,000, and still we were surprised by the size and beauty of the city; by its blocks of substantial stone and brick buildings; by its churches, schools, opera house and many beautiful private residences. If one is in search of a rough and lawless mining-town, it is necessary to search elsewhere—in fact, it is necessary to emigrate from Colorado. Leadville is decidedly like any Eastern city of the same size; save that here some things are done openly that in the East are done behind fast-closed doors, but that are done all the same.

Leadville is surrounded by places of unusual interest, such as the snowy wonder of Holy Cross Mountain, the delightful summer resort at Twin Lakes, whose waters attract the angler, and whose glacial moraines will not be heedlessly passed by the geologist. The civil engineer will not forget to make a pilgrimage to the Calumet iron mines, where the branch railroad runs at a maximum grade of four hundred and six feet per mile.

From Pueblo southward the journey offers very little of interest, save as the ever beautiful mountains in the west, and the Spanish Peaks in the south bewitch the eye with varying beauties of form and color; but from Wadsworth onward interest increases with every added mile. Toward the mountains and upward among them lies our way. In August only the mountain peaks are around curves of thirty degrees, and up grades of two hundred and thirty-seven feet to the mile. As the plain beneath recedes further and further the lifting up is felt. Our progress is slow and arduous. We unconsciously labor with the locomotive as through the stillness of the half-lit night its dry, metallic pinging smites our ears. Of a sudden a mist sinks down upon us and shuts out the last traces of the hitherto independent and pleasing picture. The road is a long and deep, concave bend, and a sharp spurt up a long and steep ascent, when we emerge from the clouds and look down upon a vast ocean of light, rifted here and there by abyssal darkness—islands of blackness—lapped by multitudinous waves of soft, silvery whiteness, tinged with nacreous blue, so Veta Pass is crossed almost ten thousand feet above the tide.

Up to the grand valley on the other side of the range a rapid descent is made. San Luis Park, the largest of all in Colorado, being one hundred and forty miles long and sixty miles wide, covers an area considerably larger than the entire State of Massachusetts. With a few exceptions the plain is level as a floor, and devoid of all timber save where the groves of cottonwood fringe the numerous intersecting streams. Of the latter the San Luis and the Saguache flow in a marshy tract of land called San Luis made from which there is no visible outlet. The soil is amazing fertile, producing excellent crops wherever the irrigating ditches have been sent. Men of intelligence and enterprise are now spreading the waters of the Rio Grande over thousands of acres, and there can be no doubt that they will receive large returns for time and money so expended. Vast sections of the Park are still unappropriated, and can be purchased at government prices, a fact that ought to prompt many a toiler from the East.

Resuming our journey we pass Alamosa in mid-plain, and soon thereafter to Antonito, hard by the adobe plaza of Conejos, with its ancient church and convent, a typical Mexican town. Further onward another ascent is made. We now take a last look backward across the Park, and behold, eighty miles distant, the graceful outlines of Sierra Blanca, most beautiful of peaks along the entire range, and with one single exception the highest in the United States, having an elevation of 14,464 feet.

We then climb mesa after mesa in interminable windings, so that frequently six miles of travel are hardly equal to three miles of direct advance. At the "Whiplash" a section-house is passed three times in less than ten minutes, the track being shaped like a low and broad S, the width of which may be half a mile, and the height certainly less than eighty rods. The winding of the track is such that the higher the top of the hills the lower the track. So we wind along leisurely, rising higher and higher, till on turning the crest of a hill twenty-three miles from Antonito, we are surprised to find that we are skirting along the rim of the cliffs that overlook the beautiful Los Pinos Valley.

The scenery is unusually picturesque. As far as the eye can reach, back and forth, vale follows vale. The mountains approach the eye from the north and east, and fringe below with dense groves of bright aspen; while down in the valley beneath wanders the glistering streamlet through the grayish-green of grass and sage. On our side the scene is ever changing. Now we pass through groups of highly colored monumental rock; then by dark eruptive monoliths of astounding heights, standing in startling contrast with cretaceous formations of almost endless hues, of delicate rose, bright yellow, and vivid green, alternating sharply

with reds and browns, and shades of blue, constituting a landscape that is unique and so strangely fascinating. As the winding panorama passes by, the tourist is suddenly notes that the end of the valley is reached, a bold mountain range seemingly cutting off every chance of egress; but the mountain side is climbed, the train rounds the out-jutting brow, thunders through a tunnel, and then runs along a narrow ledge cut into the precipitous cliffs of "Toltec Gorge." But a stone's throw across rise up opposing rock walls more than two thousand feet in height. At dizzying depths below the foam-flecked stream rushes on and leads us on. The colorful and peaceful vales of beauty so transcendent that one longs for leisure there to rest for days and days, as do the sons of Nimrod and the disciples of Father Isaac that dwell in those white tents by the Los Pinos. But we must hasten on over the Divide at an altitude of more than 10,000 feet; through Chama, blest with genial Boniface and famous for its daily trout feasts; through the forests of the Tierra Amarilla, one hundred miles in length, on whose brushy, grass-covered plains stand grand old pines, smooth of bole, and tall and straight as masts; then onward we pass by Amargo, the agency for the untidy, shiftless Apaches; by the wondrous trap dikes between Dulce and Navajo; over the Piedra and the Rio de los Pinos; then by Ignacio, among the yellow-topped peaks of the Southern Utes, owners of immense flocks and herds, and across the Rio Florida down into bustling Durango.

The first town hit in Durango was sold in September, 1890, yet at this date it contains between three and four thousand people, who support a daily newspaper, two banks, numerous schools and churches, and one theater. A fine smelter, giving employment to several hundred men, has lately been erected. The town carries on an extensive wholesale trade with neighboring mining camps. Coal and iron of excellent quality and practically inexhaustible quantity are found in the immediate neighborhood. The long blocks of substantial business buildings speak of prosperity and prudence stability.

Not far from Durango, west by south, are found some of the most interesting ruins of the ancient cliff dwellers, whose houses are hung "like eagles' nests among the lofty crags," and which far antedate the Teutonic ruins of Middle Ages.

Following the beautiful valley of the Rio de las Animas, we pass through fields of natural fertility, by private and public deacons that betoken thrift and opulence, till a halt is made at Rockwood, eighteen miles north from Durango. We have hardly left this station before we find that the valley converges more and more until it culminates in the Grand Gorge of the Animas. Midway between top and bottom the roadway has been cut into the side of the perpendicular cliff. Beating heights are above us, and down below, at an amazing distance, the tumultuous waters of the narrowly confined river. Here beauty and grandeur have kissed each other—the beauty of rock and mountain slope, of the swift and sheen of water, and the grandeur of mass and astounding height. At every turn of the river new beauties are revealed, new vistas of exceeding loveliness. Those waters of brightest emerald flow garrulously over shingly bed, or gather quietly in still, dark pools, or rush impatiently through narrow clefts, and from height to height dash down, until reaching a scorching whiteness. For thirty miles river and road run side by side, closely pressed by cliffs and wooded steps that rise abruptly more than four thousand feet on this side and on that, thirty miles of exquisite enjoyment, and then the valley winds out, and there before us in Baker's Park lies superb Silverton, surrounded on all sides by lofty, snow-tipped mountain ranges. The scene is remarkably Swiss-like. The groups of low, flat-roofed houses, the beautiful, the distant, the alpine, the cool, the blue, the cloudless sky of darkest blue, all these must recall for many a one memories of happy Alpine days.

But the place is intensely American. The streets are clean, wide, right-angled, and bordered with irrigating ditches filled with the clear, cold water that comes down from those snowy summits. Thousands are digging in these mountains and bringing forth treasures in abundance. With railway, postal and telegraphic communication, with shops, and schools, and churches, and hotels, and newspapers, one does not feel as if he was on the frontier. Person and property are as safe in Gunnison, Leadville, Durango or Silverton as in any town of the same size along the Hudson River.

In a quiet way Silverton is honeycombing the mountains and gathering great quantities of valuable mineral, most of which is now being sent to Durango for treatment, but it is expected that before the close of this year, the Beckwith smelter will be ready to go into operation in Silverton itself.

In returning from the Silver San Juan toward Denver we stop at Alamosa and make a side trip of 125 miles to Lake City. Forty miles northwest from Alamosa, at Del Norte, we enter one of the stages of Sanderson's Overland line at half-past ten in the morning, and reach our destination at three o'clock on the following morning. Our leisurely tour of look along the wide and charming valley of the Rio Grande del Norte, on either side of which lofty, many-colored cliffs and fir-covered mountains are standing guard. As Wagon-wheel Gap is approached quietness gives way to grandeur, the mountains on the south and the walls of rock on the north drawing near and nearer till at last height almost touches height. A capital place is this to tarry at with rod or rifle. About a mile south of the little wayside town of Ashcroft, the sure and charming valley of the Rio Grande close by two hot springs far-famed for their medicinal virtues. In one of these the water boils up at a temperature of 150 deg. F., while hardly ten feet from it there is a spring of water intensely cold.

The narrow rock gateway of the gap having been passed, the scenery relaxes into the foretime quietness, till at Antelope Springs the river is forsaken, and the road turns westward, through the right bank, to meet with and maintain region. As we climbed up to an elevation of more than 10,500 feet on one of the last days of August, a dreadful snowstorm was encountered. With the velocity of a hurricane it rushed down upon us, chaining the thickly falling flakes in a blinding fury, till landscape and pathway were completely blotted out. The horses' feet balled so badly that we could but creep along slowly in a temperature bitter cold.

Quickly as the storm had burst upon us so suddenly it passed by. The sun shone at once with mid-summer brilliancy and intensity. The dark green branches of the evergreens were heavily snow-laden, while the crystal ice spicules aloft in the air and the whiteness under foot were touched of rare iridescence.

Corduroy is here called an excellent roadway, and over six miles of it we thundered along at terrific speed, then

down the Pacific Slope in almost headlong descent, on through the scenic beauties of the unpopulated Slumgullion into the diminutive park in which lies the out-of-the-way hamlet by prophetic fence called Lake City.

Like Zion of the Bible, the "heavenly" situation, "Lying at an altitude of nearly ten thousand feet, and remote from the centers of traffic, it nevertheless has daily mails from all directions, telegraphic, stage and express lines, two weekly newspapers, a fine public schoolhouse built of brick, several churches, a flourishing bank, and numerous shops that drive an immense trade with the contiguous camps.

To the south of the town, amid several hundred feet above it, lies the beautiful Crystal Lake, a lake of wondrous loveliness. Its waters have been well stocked with trout, and there can be no doubt that in years to come it will become the resort of thousands who seek rest, or health or pleasure.

The Denver and Rio Grande Railway has already graded a road-bed hence to its Gunnison branch, and rails will doubtless be laid as soon as the Pacific connection has been effected. The distance to the Gunnison branch is but about thirty-five miles, in which direction most of the freighting and traveling is done.

Of its two thousand inhabitants the great bulk is digging in the silver-laden mountains. The extensive smelter established by and still under the management of Messrs. John J. and Robert Crooke, has been an incalculable blessing to the place, furnishing the miners with cash for his ores, and giving employment to hundreds of others.

Here, as elsewhere in the State, there are many mines that are most undeservedly buried under bad names. Rich leads lie undeveloped because capital is too timid or too faithless to come and make personal inspection and effort. Not mining stocks ought to be bought, but mines; for most true it is, that excellent claims can be purchased in almost any portion of the State for sums ranging from \$1,000 to \$10,000. Unfortunately too many buy simply on speculation, and speculation at last invariably defeats its own ends. The mine ought to be bought to be worked, fairly and honestly, just as the mine of coal or iron is worked. Success in mining means personal presence and interest—it means intelligence, clear grit and hard work. Fortunes would fill the coffers of thousands of disconsolate stockholders if they could but have the courage to work their mines on a large and generous scale; for as a rule it holds, in Colorado at least, that the deeper the shaft the richer is the mineral output.

From Lake City we return to Antelope Park, the sportsman's paradise, a quiet, restful retreat in the very heart of the Sierra Madre. Here the waters are alive with trout, and plain and height are the haunt of the antelope, the mountain sheep, the black-tailed deer, the bear and the elk. At Galloway's, up at the head of the Park, the tourist will find a genial, sympathetic host, a warm welcome, large, comfortable rooms of exceeding neatness, and such dishes of venison and mushrooms as he never tasted before, and probably will never taste again, unless the pilgrimage be repeated. It is well worth coming two thousand miles to revel in such limitless wealth of sport, to breathe air so pure and life-giving, and to feast the eyes on such magnificence of mountain view.

We have cast the fly in the Tomich, the Gunnison and the Cimarron; we have partaken of the treasures of the Los Pinos, the Piedra and the Rio de las Animas, and uniformly we found the fish abundant and most excellent; but nowhere can the angler so speedily burden himself with good, solid trout as he can at almost any point on the Rio Grande, between Del Norte and Antelope Park. With a red or brown hackle, a dark or whitish fly, and a wee bit of a gnat, with a little rod, high wading boots (the water is of icy coldness) and a fair share of the angler's instinct—given these, and one man can not only supply but easily gorge a good-sized camp; that is to say, if sixty or seventy pounds are sufficient to compass that end.

For sixty miles or more the turnpike follows the course of the river, whose banks are generally free from overhanging trees or undergrowth. It is so shallow that it can easily be waded at almost any place.

The open season begins with July and ends with November, of which July and September are said to be the choice months. In August rains are not infrequent, and fly-casting in the turbid waters of the Rio Grande is reported to be a waste of time.

The bend with trap, net and cartridge is not unknown, in fact, some mountain streams he has already nearly depleted. Giant powder does occasionally happen to kill one and another of this pestiferous tribe, but it is doing its work with painful slowness. The angler's hope and good wish rests with the Colorado Game and Fish Protective Association, of which W. N. Byers, Esq., of Denver, is president.

Through a blinding snowstorm the genial host took us to Antelope Springs, picking up game of divers sorts here and there by the wayside, and leaving us there to the mercies of the Overland line and the pitiless cold. James P. Galloway is an admirable specimen of the genuine Western pioneer. In times most tumultuous he has ever been on the side of law and order. Far and wide his worth is acknowledged, and it is because of this that he is represented in the legislature in the upper house of the State Legislature. Heroic deeds he has done, yet there is in him the gentleness of a child and the courtesy of a prince. Let him that don't know go and see.

## GRAB AND GREED.

I AM more than glad to see your hands up against the Yellowstone outrage. You, with Senator Vest and others, are doing good work for the nation—building better than you think, possibly. Time only can give final results, but at least the swindlers shall not win untired.

I have lived to see the Mammoth Cave and Niagara Falls degraded to mere show for the benefit of landlords, hucksters, flunkies and thieves. And now the three grand parks on the face of this favored land are being desecrated to the same tune of money, money, money. Grab and greed. When the glorious Adirondack region has been converted to a miserable desolation, and the sources of its beautiful rivers dried up from the Moose to the Hudson, until the latter will not float a first-class steamboat a hundred miles above New York City, when these clear, cold streams are bringing malaria instead of health to the dwellers along their banks; when the Yosemite and the Yellowstone parks are properly parceled out, appropriated, labeled and tariffed, the public may wake up and enter a bootless protest, but too late. The mischief will have been done; rings and companies, having beaten and swindled the people ut-

terly, and each other as badly as possible, will have "whacked up" and got away with their plunder. And human skill will not be able to make good the desecration and desolation of a century that a few greedy hoodlums have wrought in a single year.

I have often wondered, when cruising among the "thrown lands" of the Adirondacks, why the guides did not hold every dam in the wilderness with dynamite. It is no answer to say this would be lawless; it were rather self-defense. When any man or number of men assume the right to poison the air I must breathe and the water I use, and my family too, it is a duty to blow his villainous traps sky high, if I can. "Logie is logie."

Maybe I shall live to see the dawning of a day when the almighty dollar will not be all in all, but the outlook is not a bright one.

NESBITT.

### THE BIRDS OF MAINE.

With Annotations of their Comparative Abundance, Dates of Migration, Breeding Habits, etc.

BY EVERETT SMITH.

STRIGIDÆ: THE OWLS.

137. Barn Owl—*Nyctale americana* Aud.; *Aluco flammeus americanus* Ridg. 394. *Aluco flammeus prairiecola* Cs. 461.—Accidental straggler. In June, 1866, I saw a fresh specimen of this owl in the workshop of L. C. Daniels, taxidermist, at Portland, Me., and was informed at the time that it was shot at Falmouth, Cumberland county, Me.

138. Great Horned Owl—*Bubo virginianus* Aud., Ridg. 406, Cs. 462.—Common. Not abundant. Probably resident. Breeds. Owls of this species almost invariably, if not always, have a very marked odor, such as is emitted by the common skunk. So constant has been this mephitic odor in all the adult specimens I have examined, as to suggest that it emanated from the birds. But close investigation has convinced me that in all cases this perfume had been acquired by contact with the mammal, which probably had been attacked by the bird as a object of prey.

An owl of this species was found by a friend of the writer one morning in his henhouse, where about one hundred fowl were confined. The owl was standing upon the ground, surrounded by dead ducks and hens slain by it. During the previous moonlight night this bird had darted through a window that was close to the perches of the fowl, which were probably seen, and therefore attacked. Once within the inclosure, the owl had either remained by choice or was unable to find the aperture effected on its entrance by the breaking of a pane of glass, and the space was too limited for flight and darting through another pane. A bit of wood in the hands of the owner of the slain poultry soon stretched the owl beside its victims.

139. Screech Owl, Mottled Owl—*Bubo asio* Aud.; *Scops asio* Ridg. 402, Cs. 465.—Uncommon. No record of the nest and eggs of this species has been made in Maine, but it is probably a regular summer visitor to Western Maine from more southern localities. Mr. Boardman regards it as "very rare" in Eastern Maine. In the summer of 1880 an owl of this species flew into a hotel at Bangor, and was there captured, and its skin was preserved. No other specimen has recently been taken in that vicinity.

In Western Maine the species is not very rare, and a few may be there resident throughout the year. Prof. Verill in his list of the birds of Norway, Me., mentioned this species as "resident, common, breeds," and the same list mentions the short-eared owl as of "probable occurrence" only. Yet the latter species is common along the coast, but the screech, or little red, owl is decidedly uncommon on the coast, even of Southwest Maine, and does not appear to be of common occurrence anywhere in this State. Prof. Verill, in his list of the birds of Norway, Me., mentioned this species as "resident, common, breeds," and the same list mentions the short-eared owl as of "probable occurrence" only. Yet the latter species is common along the coast, but the screech, or little red, owl is decidedly uncommon on the coast, even of Southwest Maine, and does not appear to be of common occurrence anywhere in this State.

140. Long-eared Owl—*Otus vulgaris* Aud.; *Asio accipitrinus* Ridg. 395; *Asio villosus* Cs. 472.—Common. Probably some remain throughout the year. Breeds. One of the most common in Maine.

141. Short-eared Owl, Marsh Owl—*Otus bembolus* Aud.; *Asio accipitrinus* Ridg. 396, Cs. 473.—Common. Arrives in April. Breeds on the ground; lays four dull white eggs with a slight bluish tinge. This owl is common all along the coast in suitable localities, such as marshes and meadows. It is rather diurnal in its habits, and I have observed it seeking food on bright sunny days, as well as during cloudy weather, and in the evening.

Its favorite haunts are the marshes, and it resembles the marsh hawk in its habits of flying low over the meadows in search of its prey, upon which it pounces when discovered, but rarely pursues it. I have never known of its occurrence here in winter.

142. Great Gray Owl—*Syrnium nebulosum* Aud.; *Urbio cinereus* Ridg. 399; *Strix cinerea* Cs. 474.—Rare. This is the largest North American *Strigidae*, exceeding in size the great horned and snowy owls. It is only occasionally taken in Maine, where it probably occurs merely as a rare and irregular visitor from the north in winter.

143. Barred Owl—*Syrnium nebulosum* Aud.; *Strix nebulosa* Ridg. 397, Cs. 476.—Abundant. Resident throughout the State. Breeds. The most abundant species in Maine. This owl is easily decoyed by an imitation of its cries. They are apparently of a very social disposition, and are not infrequently found together. I have called them about my camp to the number of four or five in an evening, in a favorable location where they were abundant, and they would respond to the call, and come flying throughout the whole night, keeping up their peculiar call conversation, and occasionally hooting replies to more distant birds of the same species.

144. Snowy Owl—*Syrnium nyctea* Aud.; *Nyctale scandiaca* Ridg. 406, Cs. 479.—Irregularly common. Visitant from the north in autumn and winter. More commonly seen along the coast than inland. In October and November, 1876, there was a remarkable abundance of snowy owls along the coast of New England. During the month of November, 1878, I saw quite a number of specimens while visiting some islands and ledges on the eastern portion of the coast of Maine. These appeared to seek their food on the shore, and were observed perched upon the rocks left bare by the receding tide. One small, treeless island where I spent a

night was frequented by a number of white owls, and I devoted several hours of the day and evening to watching their movements. During the day they were rather inactive, remaining perched upon rocks watching some pool for crabs or fish with a patient, rivalling that of Bank Walton, and when approached would fly but a short distance from rock to rock. They appeared to be rather shy, and much more so than are usually the owls of other species.

The markings of the plumage of the snowy owls vary greatly. Upon some the black seems rather to predominate, and I have seen one specimen almost entirely black. This species is very common in the State. Ridg. 407, Cs. 480.—Not very common. Autumn and winter visitant from the north. Possibly a few may be resident, but there has been no instance of its breeding in Maine reported, yet it is quite probable that a few of the species may do so.

146. Tengmalm's Owl—*Urbio tengmalmi* Aud.; *Nyctale tengmalmi richardsoni* Ridg. 400, Cs. 482.—Rare winter visitant from the north. Mr. Henry Merrill collected this species in the city of Bangor in March, 1876. The bird was in the street, and appeared to be so dazed by its surroundings that it was easily knocked over with a stick. In this connection it is interesting to recall the fact that the great naturalist, Audubon, procured at Bangor, Maine, "in the beginning of September, 1832," the only specimen that he ever saw alive. Mr. Boardman has obtained a number of specimens, all taken in winter. Two owls of this species, taken in Bangor, were brought to Portland in November, 1882.

147. Acadian Owl—*Urbio acedica* Aud.; *Nyctale acedica* Ridg. 401, Cs. 483.—Common. Undoubtedly some are resident throughout each year, and it probably breeds in Maine. Although the discovery of its nest and eggs has not been reported, immature specimens have been taken, and the adults observed during the breeding season. This little owl, the smallest here known, is sometimes termed the "saw-whet owl," on account of some of its notes resembling the sound produced in filing a mill-saw. The immature birds have been termed "white-fronted owls," on account of the coloration of plumage, varying from that of the adults. An acadian owl was captured alive in a stable on State street, Portland, Me., January 13, 1875, by Mr. Merrill, Esq., of Portland. It was apparently of an epileptic nature, and when seen at the time in the garden near by. This captured owl I kept alive, and occasionally permitted it the freedom of my chamber, that I might better observe its habits. Upon one night, after I had stuffed and mounted several rail-pollinets, and left them upon a piece of furniture in my chamber, the little owl aroused me from sleep by the compulsion of spirited attacks upon the stuffed birds, and these attacks were repeated ever after I had arisen, and illuminated the room with gaslight. No sooner had I picked up one of the stuffed birds which had been knocked down than the owl made a dash at it while held in my hands. It missed its prey, but not me, and I learned that my midnight apparel would afford but little protection against the needle-like claws of this diminutive owl. The bird was subject to convulsions, apparently of an epileptic nature, and when thus afflicted would utter repeated cries of distress until it fell off its perch, and after a little tremor became rigid. These attacks gradually became of frequent occurrence, until death finally ensued.

### FAMILY FALCONIDÆ: THE FALCONS.

148. Iceland Gyrfalcon—*Falco islandicus* Aud.; *Urbio gyrfalco* Ridg. 402, Cs. 500.—An exceedingly rare falconer from the north. Geo. A. Boardman, Esq., has in his collection two specimens of this species of gyrfalcon, both of which were killed near the mouth of the St. Croix River. A gyrfalcon was shot at Cape Elizabeth, Cumberland county, Me., October 13, 1877, probably referable to this species, and its skin is now in the collection of Prof. J. T. Stanton.

149. Labrador Gyrfalcon—*Falco gyrfalco* Aud.; *Urbio gyrfalco* Ridg. 402, Cs. 500.—Uncommon. Mr. Boardman has had three specimens of this gyrfalcon in his collection. Two of these were killed near the mouth of the St. Croix River, in the Bay of Fundy.

150. Peregrine Falcon, "Duck Hawk"—*Falco peregrinus* Aud., Cs. 503; *Falco peregrinus veridicus* Ridg. 414.—Rare. Occasionally seen during migration. Mr. Boardman reported to me that he had seen this species at Grand Manan Island, in the Bay of Fundy, many years ago, but there appear to have been none frequenting that locality within the last few years, and the species is now but rarely seen anywhere in Maine. The capture of a specimen in autumn of 1876 at a house on Cape Elizabeth, occupied by Daniel W. Fessenden, Esq., is recorded in an interesting contribution to the Proceedings of the Portland Society for the Study of Natural History, by Mr. Brown, given before the Society April 3, 1882. "The hawk chased a pigeon into the corner of a veranda surrounding the house, and was so absorbed in killing its prey that Mrs. Fessenden threw a shawl over it and took it alive."

151. Pigeon Falcon, "Pigeon Hawk"—*Falco columbarius* Aud., Cs. 505.—*Falco columbarius* Ridg. 417. Not seen only during migrations. Rare in the spring, but more common during the autumn. Mr. Clifford Brown, of Bangor, has secured the upper parts of this hawk is dark blue, and its appearance, with the size of the bird and its swift flight, gives it a semblance to the common wild pigeon; hence the name "pigeon hawk." No instance of this species breeding in Maine has been reported, and probably those seen here breed in more northern regions.

152. Rusty-crowned Falcon, "Sparrow Hawk"—*Falco sparverius* Aud., Cs. 508; *Tinnunculus sparverius* Ridg. 420. Abundant. Arrives in April. Breeds in trees, commonly in holes; lays five or more cream-colored eggs covered with blotches and spots of brown. This species is very common in Eastern Maine, where it breeds, but is not commonly seen in Western Maine except during the migrations. The name "sparrow hawk" is quite inappropriate to this bird, as it does not resemble a sparrow in any way. It is a small bird, but its little hawk consists of insects and small reptiles. I have many times watched hawks of this species associating with small birds, and not only have they always refrained from attacking them, even under the most tempting circumstances, but the small birds do not evince the alarm that is always manifested upon the approach of other hawks. I have never seen in the stomach contents of any hawk of this species a trace of bird having been preyed upon, even when shot at a time when small birds were very abundant and insects, etc., comparatively scarce.

Although to a great extent subsisting upon grasshoppers, crickets, beetles and other insects, as also mice, small snakes, etc., yet these hawks have been reported as occasionally attacking with determination birds of various sorts, including even the dove swallows and domestic pigeons, unless the ac-

counts of the latter incidents can be referred to the sharp shinned hawk.

This little falcon much resembles the European kestrel, not only by its coloration of plumage, size and general appearance, but its cries greatly resemble those of the European kestrel. And in comparison with the name "sparrow hawk," it may perhaps be rather more appropriate to term our bird the American kestrel.

[TO BE CONTINUED.]

## REPTILES AND THEIR HABITS.

I AM tempted to say a few words on the innate vicious disposition of the snapping turtle, and to refer to an incident to which there are living witnesses. An adjoining farmer turned up with his plow a number of eggs, and brought them to me to examine. They were near the size of pigeon eggs, and covered with an elastic tough membrane. On opening, several they were all found to contain turtles about the breadth of a thumb nail. All were alive and soon began to crawl about, and to prevent falling off the board they were turned with a broomstraw, at which they would snap and bite as viciously as would the parent turtle.

While on the subject of natural history, and the pen in hand, I will briefly refer to another incident, and in part in reference to articles read in *FOREST AND STREAM*. Some writers appear to be of the opinion that serpents propagate their species without the intervention of eggs, and also kill their prey before devouring it. I believe neither to be correct, and know the rattlesnake is propagated from the egg. Some years ago, in company with several acquaintances, I visited a den three or four miles southwest of Oakland, Garrett county, Md., for the purpose of destroying them. Early in May. We had killed quite a number—two under one rock, and three under another. When I stepped on a large rock which overlooked the den, on a south hillside of an acre of loose shaly rocks, on and under which the snakes were usually found sunning themselves, after leaving the den in a semi-torpid state, and before roaming abroad for food. My attention was attracted by a peculiar sound. After carefully examining the surroundings, I discovered a large rattlesnake in coil on an adjacent rock some twenty feet distant, and apparently in a great rage. Possibly near its maturity, as my position was free from danger. I observed it for several minutes before firing. I had killed scores and scores of rattlesnakes, and it was the first instance of one causing any sound other than by the rattle. The snake would inflate the body to nearly double its size, then so forcibly eject the air as to produce a blowing, and almost a whistling, sound, in addition to the rattling, and could be heard twenty-five or thirty yards. After killing it and approaching to take the rattles in the body mutilated by the explosive shell, we counted twenty-three eggs, and each contained a living serpent in embryo.

As to the belief of some that venomous snakes kill their prey by poison before devouring it, this is, in my opinion, incorrect. I have been informed by many intelligent mountain friends, whom I consider entirely reliable, that they had often seen rattlesnakes in the act of swallowing their prey, and it was invariably alive while visible, not killed previously.

Some years ago a friend in the Alleghenies sent me—and unasked for—a large live rattlesnake in a box, which he had captured in May. My first impulse was to destroy it, but it was so much of a curiosity here that many visitors—and from a distance—came to see it. I decided, therefore, to construct a secure cage, and observe its instincts; a strong box, three by four by six feet, and the top and sides covered with woven wire, a sliding metal door, locked, and key in my pocket. With a similarly arranged box placed at one end food and drink could be introduced without a possibility of danger. It lived ten months, but during an unusually cold spell froze to death. During that time it took no food whatever, except about two tablespoonfuls of milk. It killed all the rodents put into the cage, but would not eat them. One small crippled bird was introduced. On its hopping on the snake, was struck on the neck and almost instantly killed, did not live two minutes. I saw it repeatedly afterward attempt to swallow the bird, but the moment it reached the poisoned part, it would invariably throw it out. Hence, with this and other evidence as conclusive, I doubt the rattlesnake's killing its prey for food—by poison. Having a ditcher at work, I came across a small snake, and desired to "introduce it to its brother serpent." When placed in the cage the snake appeared to dread it and would not permit the cat to touch it, changing its position constantly as approached by the cat, but would not strike it. It was amusing to witness a deadly serpent completely conquered and cowed by a harmless cat. I have witnessed two conflicts between snakes of different species, the first between a viper and a blacksnake; the latter was the victor by coiling around and either crushing or strangling the viper; the second, quite recently, was witnessed by several persons—a mottled, black and white snake was captured by one of my sons to send to the Academy of Natural Sciences as an unusual species, and in the same box was afterwards placed one of another species, about half the length of the large one. Very soon the larger seized the smaller one, and began to crush it in its coils; the box was covered with snakes, and not morning the smaller one was invisible. Nor was there any mystery about it, as escape was impossible, and from the previous conflict and largely increased size and torpor of the victor, it was clearly demonstrated that the larger one had killed the smaller, and then swallowed it. Of this fact all were fully convinced beyond a doubt, and so end my snake stories. I have heard a saying that "dog won't eat dog," but I am fully satisfied that snakes will eat snakes just as much as that a cannibal will feast on his fellows.

E. S.

SANDY SPRING, Maryland, Jan. 1893.

MAINE WINTER NOTES.—Bethel, Me., January.—By a private letter last week from an old hunter friend over in Somerset county, Me., he informs me that recently prospecting in those deep forests, he came across moose signs, and after following up the buildings and looking for trail to winter works, and finally struck the droves or tracks of two moose freshly made, and by careful creeping he discovered in the distance two bull moose, both armed with fine, heavy antlers, looking the picture of loveliness to his old hunter eyes. In trying to creep nearer to get a shot, he accidentally stepped on a dry limb, which cracked with so loud a noise as to frighten the game, who made off at a tremendous pace. This shows that the Maine woods are not entirely depleted

yet of the noblest game that ever roamed these woods. Today (the 25th of January) I shot a very beautiful male grouse. Snow buntings are quite common here this winter. A chickadee and a sparrow are constantly on my door yard, and the former takes his meals from a large sundowner hanging by the side of my woodshed. Our location is twenty miles east of Mt. Washington, of the White Mountain Range, and the thermometer keeps way down below zero most of the time.—J. G. R.

PINE GROSBREASTS IN NEW JERSEY.—Stanley, Morris Co., N. J.—While sitting by the window on the 16th of December I saw six strange birds light on an apple tree a few yards from the window, and commenced eating the decayed and frost-bitten apples that remained on the tree. I finally recognized them to be pine grosbeaks (*Pinicola enucleator*). They continued feeding for about five minutes, when they flew to some pine trees near by, where they commenced feeding on the seeds. Having satisfied themselves they returned to the apple tree. Thus they went from pine tree to apple tree and back three or four times. I noticed one peculiarity in their feeding, that is, each separate bird selected an apple and always returned to feed on the same one. Very unlikely for me it was Sunday, if it had not been I would have added some of their skins to my collection. They were mostly immature birds with the exception of one or two mature females.—HARRY DE B. PAGE.

## Game Bag and Gun.

To insure prompt attention, communications should be addressed to the Forest and Stream Publishing Co., and not to individuals at the residence. Letters from the office matters of importance are liable to delay.

### THE CANEBRAKES OF ISSAQUEUNA.

THE cotton-planter and his sons are, as a general thing, fond of their guns, rods, dogs and horses, and in this part of the country are blest with a land teeming with game and fish, offering unequalled facilities for frequent sport. In hunting, the negro, bear and deer, as well as the smaller game, the dog takes an important part, in fact, the principal one. Such being the case, it may interest your readers to describe the favorite dog for the several occasions.

First is the bear dog—a mongrel, part cur and part hound, full cur, full hound—a motley collection. The "trail" dogs are usually full hound, although it is questioned by some whether the full hound or half pointer and half hound is the best for this purpose. As to this as it may, the packs I have in view are by full hound, English stag and Virginia fox-hound, and they are capital ones, too. The fighting dogs, those who do the heaviest work, are generally of the mongrel kind—terriers, curs, hounds, etc., mixed and intermixed until it would be difficult to trace distinctions. Bruin stands a poor show in a contest with these fellows, and generally retreats after a race of an hour or so, and is then easily shot by the hunter.

Good and "tough customer" is roused, and a square fight with the dogs is made, usually ending in Bruin's defeat, and another short race, a second stand and fight, another run, and so on, until some fortunate hunter gets into the fight in time to get in a shot, which terminates in the death of Bruin. The victory is signalled by the "call blow" sounded from the horn. This "call blow" consists of three long, distinct "blows" or sounds from the horn. The sound of the excitement of the sport would urge a person to indulge in it, yet it is the finest sport of all out hunting. Once you try it, it sticks, and the fondness for it will not shake or wear off.

The blood-curdling stories told of the bear's dangerous fighting qualities are a humbug, for unless he be badly wounded, and cannot get away, he is, next to the panther, the veriest coward that infests our forests. There is no danger in him, except to your dogs. These he handles pretty roughly, and many of them are killed; scarcely a chase occurs but some of the dogs are seriously wounded or killed. Especially is this the case if your dogs are any of them green in the business.

We use in the bear chase every description of gun. My friend Smith and the members of our club mostly use breech-loading shotguns, 12-gauge, with round balls. This gun is certainly the best for the purpose, and the hammerless would be especially so since the danger of accidents by the hammers being caught against the cane, and the gun discharged, is removed. Several of our "bear-hunters" prefer the breech-loading rifle used in the U. S. Army, and commonly called "needle-gun." None of "Byrne's" pistols are used here. All are armed, in addition to the gun, with heavy hunting knives, which are used mostly for cutting a way through the dense cover.

The deer-drive is made with full-blooded hound, English stag and foxhound preferred. Sometimes the hunter is placed upon stands along the favorite runs, and the deer is shot as he is driven by, but this feature of deer-hunting finds little favor here, as to occupy a stand means the loss of the best part of the sport, which is the better-skitter ride through the timber, a perfect steeplechase, with the music of the hounds' voices ever in the ears, and the excitement of this is to the hunters music indeed. I've tried it and know—fifteen or twenty hounds in full, cry make soul-stirring music to the hunter's ear. In our drives every man must look out for himself, each one's chances for a shot is equal to that of the others, provided all are equally well mounted. It is a race, as usual rewarded to the practiced and swiftest, who heads the deer and kills him, if he can. It isn't done every time, I assure you.

Deer were driven here before the overwood last spring, and our chases were generally short. But frequently if a deer gets out of the usual ground covered by the drive, he is allowed to go in peace—the dogs are recalled and another deer started. Sometimes in the course of one day's hunt twenty deer are chased; and right here let me say that the very next, or, at latest, the day after the hunt, you could go over the same ground and run out the same deer, or as many as on the first day, presumably the same deer. The

deer were never frightened away by driving with hounds—try it here and you will be convinced.

Sometimes our hunts we start a panther, one of those "son-of-a-bitch" cats which are so frightful to gaze upon, measure often nine feet from nose to tip of the tail. When we strike these fellows, the race is short and sweet. The cowardly rascal will take to the first tree, like his cousin the cat, and is easily shot. It sometimes happens, however, that he does not tree, especially if he is surprised by the dogs and caught before he has time to "climb up" a tree. When this happens you may count on some good fighting, and a dozen men and two or three dogs will surround a sized panther can whip all the dogs you can crowd upon him.

Several years ago, a party of us was on a camp hunt in the lower end of this county we were after deer, and bagged eleven in four days. On the morning we had appointed to break camp we were up early, preparing to have a short drive before leaving. After going about five hundred yards from camp, we came upon a freshly killed deer that had been partly devoured by some animal, which had evidently been frightened by our approach, and had concealed itself. The dog coming up soon found the trail, but seemed loth to follow it, displaying uneasiness and fear by their bristling backs and their growls; but one favorite, old Jack, a pointer-hound, came up, took the trail and bravely led off the chase. When once started the whole pack were off in a hurry; and we followed close up. A race of a hundred yards brought into full view a magnificent young panther, which manifested defiance for a race, but a stubborn determination for a fight.

She did not have long to wait. The dogs, once over their fright, were in for it, and some-sized her ladyship, and the hunt began. According to their usual fighting tactics she lay upon her back, feet up, and her four feet containing twenty claws, as sharp as razors, fairly made dog meat and hair fly. Panther and dogs were so completely mixed that we were compelled to withhold our shots for fear of killing man and dog. Every second a dog would crawl out satisfied; the fight lasted only a few seconds, when Walter Smith, one of the party, got in a shot that satisfied the panther and ended the fight. Several severely crippled dogs and one dead panther were the list of casualties.

There are many of these annually here yet. One was killed within half a mile of my dwelling, by E. V. Miller, that measured nine feet from nose to tip of tail. Three were seen on the same ground last spring and became caught by the negroes living on this and adjoining plantations. These three panthers came near riding the county of that nuisance the "yaller cur," that infests it by the hundred, every darkey owning at least three. The panthers killed quite a number and devoured them—in fact, the dogs were the principal food of these animals while they remained. The brutes finally became such a terror that friend Smith was called in by his bear dogs, and drove them off, failing to kill any one of them.

My dwelling stands in the center of 200 acres of cultivated field, and the tracks of these panthers were made within 200 yards of the house.

So much for bear, deer, panther, and the dogs used to hunt them. R. M. Smith, Jr.; W. J. Smith, W. P. Allen, John Stem, Mr. Wescott, and R. B. Phipps are now out for a week's camp hunt for bears, and will doubtless bag five or six of the kind, and two or three of the deer. W. E. Allen, R. B. Phipps on a two days' hunt. This swells the record of the hunt to the present time to eighty-seven bears. R. M. Smith, Jr., was in at the death of every one of these except two. How is that for bear hunting? It was not a good time for bear either.

Quail are plentiful and good bugs can be made any day. Our favorite dog for this sport is the pointer, because of his short tail, which he loses too much time pulling cockle-burrs from his long hair.

More anon.  
ISSAQUEUNA COUNTY, MISS.

STEELE'S HAYCO.

### THE NEGROES AND THE BIRDS.

IF Sly Reynard is the champion bird extinguisher of the old Dominion—mother of States and statesmen—then does it happen that in the southeastern counties, where partridges do most abound, there, also, the fox is most abundant? "M., who writes in your issue of Dec. 21, must be amazingly unsuspecting if he thinks the freedman kills partridges for the pleasure of displaying them to his white brother, particularly during the close season. Indeed, his faith in their simplicity is childlike and blind; whereas, the craftiest diplomat that ever wore a white skin is a novice in the art of concealment compared with the Virginia negro. Does "M." imagine that the colored brother never interviewed a henroost because he has never seen the trophies of the interview hanging on the outer walls of his log cabin?

I did not mean to assert that the partridge had been exterminated by the freedman, or that he was the sole cause of scarcity, but I do affirm that scores of negroes from the James River to Mataponi River, and east of the Richmond & Fredericksburg Railroad, hunt for squirrels and hares all through the spring and summer, skulking along the edge of woods, swamps, and thickets, and keeping carefully out of sight of white folk; that he pretends to be nothing but a pot-hunter, and that there is no fairer mark for the pot-hunter than Bob White sitting on a rail, be he an African or an Anglo-Saxon; and pot-hunting is not confined to the former, by a large majority, I am glad to say.

I remember the winter of '80-81, but found no birds frozen, nor missed any from several flocks I watched closely in Hanover county (the birth place of Patrick Henry and Henry Clay), nor did I hear of any that had been found frozen, although I made diligent inquiry, and east of Hanover there was very little danger of their freezing, but the winter of '81-82 was the warmest we have had since '42, nevertheless, there were not so many birds by half last fall as the fall before. I also remember the bitter cold winter of '83-84; yet in the fall of '85 the oldest hunters in Virginia had never seen birds in such immense numbers. And why? Because for four long, weary years we had been after bigger game, or rather that bigger game had been after us, and the birds had been allowed to lay and hatch and rear their broods in peace and quiet, with none to make them afraid, save birds and man.

And well aware, too, that Bob White's enemies are legion—the hawk, the fox, the mink, the weasel, the skunk, the black snake and the half-starved hound, the greatest egg sucker and poacher on earth, yet I believe the main cause of the general dearth of partridges in Virginia is the wholesale slaughter of the innocents by the insatiable pot-hunter re-inforced by the aesthetic wing-shot. What more deadly weapon than a leg-bag, or "leg-leader," or what animal that walks, runs or flies half so destructive as a sportsman, who

goes out full of vim and ardor, and who can cut down a bird by the glint of its wings in the thickest cover." An experienced hunter is a terror to the crack shots of Richmond, Lynchburg and Charlottesville.

Perhaps I do not exactly understand what "M." means when he says the freedman is not "a social or political factor" in the Northside and Piedmont counties of the State, as he has never been admitted into Virginia society (noted for its exclusiveness), but he casts 2,000 votes in Albemarle county, and is regarded by every candidate for office as a very large "factor." I had just met the gentleman who ran for Congress last fall in the First District lying in part on the Potomac River up to Aquia Creek, who was enormously surprised to learn that the freedman has cleared out of that part of the politician's vineyard, when he was present in the late election to the number of 7,000 votes at least.

But "M." must forgive me if I fail to see the connection between "a political and social factor," and a shooting and hunting factor. There is a tribe of Indians on the Pamunkey River, in King William county, who make their living by fishing and hunting, and who are death on fin, fur and feather—but they can't vote, nary time.

I have no apology to make to the good-natured, shrewd, shiftless freedman, since I know he will take no umbrage at my saying he pops in and out of the scene, and he has the "factor" in his hand. But if I had known my reference to him as one of the "factors" of bird scarcity would have sunk so deep in "M.'s" heart I never should have mentioned him. And it gives me genuine pleasure to bear testimony to the good character, industry and honesty of a very large class of our colored population.

"M." failed to read my communication attentively. I expressly said that partridges were scarce north of James River, from the Blue Ridge Mountains to Chesapeake Bay.

There are a number of negroes in and around Charlottesville who keep dogs for possum and hare hunting, and all this had, snowy weather they have scoured the fields hare hunting. Is there a white man in the world so green as to believe that they refrain from shooting partridges whenever they come upon them the game law to the contrary notwithstanding? RALEYWOOD.

VIROGINA, JANUARY, 1888.

### A ROCKY MOUNTAIN DEER HUNT.

IN Montana the blacktail deer winter in the heavily timbered foothills adjacent to the main range of the Rocky Mountains, staying there until the warm sun and melting snows of April remind them that the time has come to seek the refuge of the mountain peaks, whence, safe from the pursuit of man, and far from the turmoil of the world, they may raise their young in peace.

The first heavy snowstorm in October drives them from the main range into the foothills, where they stay until the heavier snows of winter push them further south. It was at this time of the year, after the first heavy snow, that my friend Dan, as line a young man as it has ever been my pleasure to meet, and myself, decided to bring forth our rifles, which had been laid away all summer, and try our luck with the blacktail.

Early one bright October morning, having loaded our wagon with "grub" and blankets, with Bess and Moll, two little mares as pretty as can be found anywhere, to haul provisions and pack our game, and whistling to Prince, our dog, to follow, we started for our camp in the foothills, where we had pitched our tent.

We had traveled some six miles, and were passing through a narrow valley when Dan says: "Look, what are those white appearing animals moving along that little reef half-way up the side of the hill?" It must have been a band of antelope. They were watching us, so we drove on till they passed out of sight over the ridge and into a little basin on the side of the hill. Hastily unclipping Bess and Moll, and telling them to wait, we hurriedly climbed to the top of the reef. Looking between the rocks we saw some nice fat antelope feeding quietly in the basin, but out of range. We decided that Dan was to go around to the right and try to head them off, and I was to stay where I was. I waited some time, and as he did not appear, and the antelope were feeding away from me, I concluded to go around them to the left. By reaching around behind I at last got ahead of them, and slipping down behind the rocks, I heard the report of Dan's gun and saw one of the antelope drop.

The rest ran through a pass between Dan and me, and as they ran by we both shot, but still they rushed on. Following them a little way I almost fell over a two-year-old buck lying in the long grass, which had evidently been shot as he was passing us, and running a short distance had fallen dead. I picked up the two antelope to the wagon we had come to camp.

After a hard pull, a long pull, and a pull all together, at 4 o'clock we reached the head of the little stream on the edge of our hunting ground, where we were to camp. After moving our camp out into the brush for shelter and picketing the horses, I suggested, as there was still an hour of daylight, that Dan, taking the dog, should go up into that heavy timber at the top of the hill, while I, taking a stroll down the creek, and as I had seen fresh signs of the deer in the brush close to camp, I felt quite sure of seeing some whitetail.

The creek was a small one, with only a few bushes along it—just room for a deer to hide. I was walking quietly along the bank, above the creek, a few hundred yards below the camp, when I noticed the bushes moving a little just ahead of me. I heard a louder crashing, and out jumped a deer whitetail, and I fired a warning shot, and two fawns. They stopped an instant to look at me, and quickly taking aim at the dog, I fired. They were too close and my bullet went over her. At the shot they loped off, waving their white flags at me in defiance. Another shot a little lower at the yearling passed through both her shoulders, bringing her quickly to the ground, when she was soon dispatched. The other three ran and till they came to the heavy brush along the Dearhorn River, and I was obliged to give them up.

Bringing the camp up to the top of the hill, preparing supper of antelope steaks, potatoes, flapjacks and coffee when Dan arrived. He had struck fresh sign as soon as he entered the timber, and going very carefully, a deer which had heard a noise in the brush below ran across and stood in front of him, looking at him, not fifty yards off. He could barely see the deer in the brush, but aiming just back of the shoulders he fired. The deer ran and he shot again. Going to the spot where the deer had stood he found blood. Following the dog's lead in the direction in which the deer ran, he was taken to the dead deer, a two-year-old buck, which had run fifty yards and then fallen dead, shot through the lungs. After supper we made our beds of hemlock boughs,

or, as we call them "mountain feathers," and well satisfied with our day's sport slept as only true hunters can sleep.

Breakfast can be next morning at daylight, and we were off for the runway, one-quarter of a mile from camp. We watched from behind the scrub pines until sunrise, and as the deer thought they would stay at home and not travel that day, we followed up the gulch to visit them. We had passed through several heavy patches of timber, when we saw tracks in the old snow drifts, and then separating, Dan took down into the heavy timber of the ravine, and I kept on the crest of a hill and cut across the pine belt, when a three-prong buck, which had been lying down resting, sprang to his feet. He stood and looked at me. He was seventy-five yards off, and as yet half asleep. Slowly I raised my rifle, sighted carefully and fired. He sprang away, apparently unhurt. At the shot Dan came up, and I told him "I had just missed the finest shot at a buck I had ever had." There was no sign of blood. Keeping the dog steady, we let him take the shot. He led us into the open, and at a hundred yards from where I shot we stood over the body of the dead deer. He was shot through the lungs, and going at full speed, had stopped short, reared up and fallen backward dead, for he lay facing the direction from which he started. Dragging him to the nearest tree, we hung him up and marked the place.

There was only ten or twelve deer, and were quite enraged at the prospect of the deer's sport. Dan was to take the edge of the timber, and I was to take the inside.

Dan heard a rushing, crashing sound on the hillside above him, and saw two large bucks running madly down toward him. The timber was so thick that he only got a snap shot at them as they sped past him. They had winded me, and never noticed Dan at all till he fired.

They were now in the open, and we had an open glade, where the timber had been burnt off, and the ground was covered with low bushes and fallen trees. At first we saw nothing unusual, but on closer inspection Dan thought he saw a pair of horns above the grass in a little clearing. On examining it with the glass, we not only saw through the brush the owner of the horns, but three or four more deer partly hidden by the undergrowth. They were too far for a shot, and we were so wary that we did not shoot. The deer were very still, and did not scent us. We crept back over the hill out of sight, and held a council of war, which resulted in Dan making a full detour of the woods and approaching the deer under cover of the bushes till he was within 150 yards of them. A snapping of a stick, and in an instant with a snort the old buck was on his feet, followed by two does and two fawns.

Mean while I had got to the head of the ravine with the dog and intercept them if they took up the mountain. Watching Dan I saw the smoke from his gun and at the report the deer jumped around a little but did not run. Again his Winchester spoke to them and I saw one of the does fall. She was up again now, and although behind the rest was making a good run. Up the hill they came, passing me 200 yards off. I shot, but my gun being sighted for 100 yards my bullet fell short. By the time the does were within a little, and turning Prince loose I hastened after him. Presently I heard him bark; he had overtaken her and was having a desperate fight. Several times she shook him off, when Dan, closing up, finished her with a shot which broke her back. He had shot her too far back and too low down the first time. Without the dog we would have lost her, although eventually she would have died. We hung her up over the edge of the timber and by a roundabout way started for camp.

We saw several more deer but could not get a shot until crossing a gulch near camp. At the foot of a ravine I saw a large buck which had just come down from the timber and was on his way to water. He was 200 yards off. I raised my sight, dropped on one knee, fired, and to my surprise, saw him fall. Running up to him I found his neck was broken by the bullet, and he gave a few convulsive kicks, he relinquished the struggle. Next day we packed our game to camp; floding one of the deer which we had hung up was considerably torn by a mountain lion, and as we had all the meat we needed for present wants, and the clouds were threatening snow, we struck camp for home, which we reached in good season, feeling very much the better for our few days' camping in the mountains. The deer which we shot on my sheep ranch in October or November, I will be most happy to show them the home of the deer and mountain sheep, and if they can't kill one it will be their own fault. If they have lost any bear and want to find him, I can put them on the track where, if they don't find the bear, perhaps the bear will find them. THE ROCKIES.

### THAT REMARKABLE SHOT IN FLORIDA.

IN THE FOREST AND STREAM, of January 18, "Yours for a truth—Knick," writes thus: "I see that your correspondent 'Wells,' says he doubts the statement I made of a deer being killed with No. 9 shot, etc." What part of the "etc." did I doubt? What is the "etc."? Now I beg to assure "Knick" that I think he will find it rather difficult to discover the "doubts" to which he refers, in the article in question. I surely said I should accept the statement as being true, and I said that it would have been rather unsatisfactory if the writer had condescended to inform us what was the distance of the unfortunate deer from the fortunate sportsman, at the time the remarkable occurrence took place. It was a remarkable shot, and for that reason, "Knick" handed it down to history—or contributed it to history. I admitted that a good charge of gunpowder would kill a deer, at very short range, with any shot in front of me. But I said that it would have been rather a long shot, such a charge would not penetrate the hide of a buck in the "blue season."

I suppose "Knick" inferred from the fact that I made his statement the foundation of some remarks upon the extravagance of expression. Perhaps he is rather sensitive in regard to it. But I do trust that he will not permit Capt. V. J. S. to make any such outburst. Ordinarily the expression of a willingness to swear to some big story suggests a doubt of its truth. But I surrender. Capt. V. J. S. killed a deer in Florida with No. 9 shot, propelled by four drams of gunpowder, "a little over twenty yards measured." How much "over"? What sort of a measure was used? Hunters' measure, or cloth measure? How did he find the exact spot where he stood, and where the deer was? He put the oath of a respectable witness, before a justice of the peace, all doubt must vanish; and so "Purcell, a proud editor professes,"—"or words to that effect." But, "I reiterate," it was a very remarkable shot.

I must be allowed to express a grave doubt whether any justice of the peace, who really comprehended the character and duties of his position, would allow his office to be used to strengthen by the solemnities of an oath, the statements made by any sportsman, to the distance which he killed a deer, a duck, or a sand-hill crane. Justices are allowed, or rather empowered to administer oaths, in matters of controversy between parties in regard to legal rights. In mere matters of opinion, when no legal right or duty is involved, they have no such authority. Even if they did, somehow might object, that he did not have notice of the time and place of investigation, so that he might not be present either in person or by attorney, and subjected the applicant to a cross-examination. But I object to all swearing upon the subject, except, perhaps, as to that part of the comment which states that the shot penetrated the "ribs." That, I must say, requires a little corroboration. That is indeed remarkable.

Now, I trust I have not offended my friend "Knick" by making an extent that he will not have the kindness to forgive me. I always make allowance for a vivid imagination, and confess I take many statements of sportsmen "*enno grano salis*." It was just this measure I used when I saw the assertion of a hunter in the FOREST AND STREAM a few weeks ago, that about Lincoln, in this State, it was not uncommon to find coveys of quail containing fifty birds. That I did not believe, I do not believe it now. I have seen many coveys of these birds, and never yet saw one so large as that. Gentle men are often deceived by the appearance of things, and few men have such accuracy of vision as to be able to count the number of birds as they whir away with great velocity. So much for that. WELLS.

[We have the records of half a dozen authentic cases where deer had been killed with No. 10 shot, and in one or two instances over points. Several of these cases have been recorded in FOREST AND STREAM. It is hardly necessary to say that in every instance the deer were shot at very short range.]

### INDIANA GAME INTERESTS.

A BILL to prohibit quail shooting for three years has been introduced into the Indiana Legislature, by Mr. A. C. Lanier, of Madison, has published a circular in which he says:

"It does not seem possible for the Legislature of Indiana to convene without having a tilt at the game law. No State has a better law than ours, and none more universally observed. There is before the House now a bill (H. B. No. 30) forbidding the killing and sale of quail. The object of this bill is, no doubt, to make quail more abundant; but a greater mistake could not be made. It is not the gun that destroys so many birds, but the cold waves that sweep down suddenly from the North that freezes them to death as they sit huddled together in the field. Whenever the temperature falls 18 or 20 degrees below zero, the quails are frozen to death in whole coveys. They rarely seek a sheltered place to roost, but are usually found in the open field, oftentimes in the most exposed positions.

"During the seasons of 1874 and '85, the quail were more abundant than ever known before or since, in this State. The three preceding winters had been mild and the summers dry and favorable to their nesting; but the winter of 1856 almost destroyed the entire crop. When spring came and summer whistled by, the bird was rarely heard. When the season arrived for shooting it was a rare thing to find a covey.

"From 1856 a gradual increase took place until Jan. 1, 1864. On the morning of that day the mercury fell from 20° to 25° below zero. Thousands and tens of thousands of birds were frozen to death before noon.

"From 1864 to 1881 the increase was slow. It more than once occurred where the winter was mild and the summer wet and unfavorable for nesting, and so no increase took place.

"The winter of 1881, like those of '50 and '64, was also very destructive to the quail. In many portions of the State one-half or more of the crop perished from cold, and in other portions nine out of ten died from starvation, the ground being covered with snow for a long time.

"The excessive cold of winter and a wet summer both retard the increase of quail. Last summer was a fair illustration of the injurious effect of a wet season. The first nestings of quail and prairie hens were both drowned out by the excessive rains of May, June and July. Many of the quail had a second brood. The prairie hens never have but one.

"Here is a simple and true history of the increase and decrease of quail in our State and the causes therefor, for the three preceding years. There is every portion of the law where prohibition could effect any good I cannot see it. It has been tried in Ohio and signally failed. If it were enforced by law, the trap and the hawk would take the place of the gun. 'The Lord greth the increase.' So let us enjoy it when it comes, and not make laws trying to forbid that over which we have no control.

Mr. F. M. Greenleaf, the well-known humorist, and editor of the *Evansville Journal*, has recently been appointed game warden of the First District of Indiana. In a late issue of his paper he announced his intentions in this vigorous manner:

"It is highly probable that in this city a little more attention will be paid to the game law in the future. It has been shamefully neglected here, having been openly violated by parties who have expressed their own appointed game warden in this district and we propose to do our duty. It is a thankless position, as all such positions are, but we don't propose to be intimidated. Right is right, and wrongs no man. Parties who have handled game in this city in past years have laughed when cautioned. Netted quail have been openly exposed, and it is safe to say that not one dealer out of fifty in this city ever looks to see whether the birds consigned to him are game or not. There is no game law here. It is just such disregard of the law that has netted us in the past. It is just such disregard of the law that has netted us in the past. The man who loves to go out in the fresh air and hunt game legitimately finds none; it has all been sacrificed for the sake of the stomachs of a few epicures. Every time anything is attempted in the way of stopping this wholesale slaughter of quail, a virtuous howl goes up, and the air is full of mud and mud-slinging. Little beetle-legged scribbles, who don't know a jack-snipe from a gutter-snipe raise their paws in virtuous indignation, and add their feeble howls to the rest. We are happy to say that things are now entirely changed and there is a general feeling all over the country that this wholesale butchery must be stopped, no matter who suffers. We wish to say right here that to any and everybody who makes any

bird tie shoot off with C. L. Church. Both shots had twenty birds, and in the shoot off Taylor got five birds and Church four. There will be a club shoot of the Tallores this week.

or 30 there will be a grand journey at that place given by the sportsman's club and Cogan, Hays, Tarrill, Williams and the rest of the Chicago shots are wanted over there to carry off some sweepstake money. This is about all there is in the week.

CHICAGO, Jan. 20.

### THE AIR SPACE.

I FIND quite a discussion going on in your paper in regard to an air space in guns. During my experience as a rifle maker for the past thirty-five years, I have seen as many as fifty guns spoiled by being fired when the bullet or some other obstruction was near or back of the center, or at the muzzle of the barrel; in most cases in rifles where the bullet was wedged at a point from eight to twelve inches from the breech. The column of air in such case is driven into a space of  $\frac{1}{4}$  to  $\frac{1}{2}$  inch long, which cuts a groove in the barrel as cylindrical as though it had been done with a tool made for the purpose. The air being at so high pressure causes the barrel to bulge at that point, which loosens the ball so it passes out. A bullet driven into the muzzle from two to six inches will not damage a strong barrel, because the column of air is so long, and divided over so much space, that it starts the bullet without damage to the rifle, but it would be likely to spoil a shot barrel unless it was uncommon strong. A good shot barrel might stand when fired with a wad in the muzzle, but wet earth or sand would burst them. To fire a rifle or strong shot barrel with a ball only two or three inches from the breech would not be likely to damage them. It depends on the length of the air column whether it spoils the gun or not.

A light, loose-fitting ball might be fired when twelve inches from the breech of a strong steel barrel and not injure it, but if a heavy conical ball of soft lead was used it would spoil the gun, provided the ball fitted air-tight, and a suitable charge of powder were used as in target-shooting. I consider it dangerous to fire a gun with the ball or charge of shot from two to three inches from the breech, and had for a shotgun when the obstruction is near the muzzle. I wrote a few lines on this subject in my letter published in FOREST AND STREAM, Jan. 24, 1878. GEO. H. FERRISS, Utica, N. Y.

### Editor Forest and Stream:

I have seen corvids fired from the muzzle of Springfield military breech-loaders on several occasions, and once in the summer of 1880 (being captain of a team), coming from the target to take my turn to shoot, I loaded and fired hastily. I made a good four with the bullet, and made the sand fly with a half-ounce sinker and a yard of stout line with an oil rag attached used for a wiper. No bad results to gun. The wiper had been left in the gun for safety, but was lost.

EMUE, Pa.

HEAD LIGHT.

### DUCK TRAPS IN THE JAMES RIVER.

WHEN on the James River last December, about fifteen miles below City Point, we found on the feeding grounds "duck traps" by dozens, each visited every morning by men in boats, and yielding up from twenty-five to a hundred or more victims who are scooped out with a hand net through the opening left in the topnet, which is tied again when the trap is emptied of its contents. The ducks' necks are wrung as they are flung fluttering into the boat. The trap is built on the principle of an ordinary fyke net and baited with corn, which is plentifully strewn in the entrance. The dimensions of the trap being 12ft. x 16ft., each one will hold a large number of fowl; and I was informed on good authority that two of the most successful machines had captured, one, over one thousand, the other, from eight to nine hundred; and this in the space of eleven days only. These traps are set along the river for miles, by fours and fives, on the most frequented feeding grounds, and the destruction they cause is enormous. The effect of this wholesale slaughter is growing more perceptible, year by year, in the scarcity of fowl on their old haunts. Broadbill, widggon and black duck are the greatest sufferers; the canvas-back and red-head avoid them to a great extent. The proprietors are mostly negroes, although the "white gentleman" is not by any means backward in the business, sometimes having three or four of them in running order. The first heavy ice coming down the river takes them with it, but they are easily replaced and at small expense. All condemn them, and yet no one has courage to take steps toward their removal, for fear "some one will get square," you know. Many a fine bird is sold in the Southern markets, and I dare say in New York, if the truth be told, without a shot mark upon them—"scared to death," one might say. But in the words of one of our notorious public men, in years gone by, "What are you going to do about it?"

NEW YORK, Jan. 25, 1883.

DICK.

### PENNSYLVANIA NOTES.

AN extract from a letter from a friend residing in the Lehigh Valley, Pa., will show how much good the planting of quail and attention to them in the winter season has done in his section of the country between Mauch Chunk and Catasauqua. "What little time I put in last fall was near home. Woodcock were scarce, but quail were plentiful in certain districts where we put them out last spring. The trouble was that the young birds were all small at the opening of the season and before they were large enough to shoot. I went West on business and did not return until it began to get cold and blustery, and I never had a fair chance at them until between Christmas and New Year, when the season was nearly over. There are any quantity of birds left over here. A friend, who was out on the last day of the season, reported ten coveys, most of them full with twelve or fifteen birds, within a few miles of town. We shall trap and keep all we can over until next spring. We have had some bad weather for birds lately, one snow after another, not very deep, however, but crust made. Winter is not half over and there is plenty of time for more."

Until within a few years quail have been an unknown bird, so to speak, in the portion of the Lehigh Valley from which my informant writes, owing to the general severity of the winter in that elevated section of the State, and it has only been by the exertions of four or five gentlemen that the birds have been steadily increasing. Your correspondent can always get a good day's sport there, and has it yearly on invitation, although the hill climbing is terrible, and a more level country would be greatly preferred. The efforts of these gentlemen may well be copied by others in every State. In New England especially, I am sure, the same re-

sults could be effected by a systematic care of the quail in the winter.

Hawks this winter, in Maryland, are very numerous, and have been very destructive to the quail. I am also told by residents of Milford, Del., that whole coveys that were left over on the "neck" farms of that section have been reduced, bird by bird, by the same pests, until but few remain.

A trip down the Delaware River on one of our city boats as far as Reddy Island shows no fowl except a few shrikes from a distance. The water is very low, the ice is floating, and this freezing during the cold snaps requires the efforts of all the iceboats to keep the channel open. The weather is moderating to-day. We look for more snow.

A large snow owl was shot back of Pennsgrove, N. J., last week.

The Delaware River shores about Burlington, N. J., and Bristol, Pa., are black with flocks of crows eking out a scanty livelihood. Netters catch them by hand when the snow covers the ground and will supply them for trap-shooting at ten cents apiece. Their flight is slow and heavy and such practice from a trap is poor.

PHILADELPHIA, Jan. 27.

### "LET WELL ENOUGH ALONE."

I LIKE black flies, punkies, mosquitoes and small-pox, in their time, so already have proposed amendments to the game laws put in their appearance at Albany, to distract the attention of the legislators, perplex the public, and make trouble and expense for all interested in the protection of game and fish. No such changes or amendments are needed. First—because existing laws, as a rule, are sufficiently stringent and intelligible to accomplish the desired purpose; and secondly—and what is of great importance, because the laws are now generally understood, and in some sections of this State, where enforced, are respected, because the public have learned from the different seasons open and close, what the penalties and other conditions are. These being the facts, to amend or enact will surely cause doubt, confusion and indifference, and if after a series of years, and a thorough enforcement of present laws, defects shall be found, then, and not till then, should any changes be made. You cannot make a horse draw a load by urging him on and making him stop at the same time.

There is not a poacher or marketman in this section that does not know just how far he can go with impunity, and how far he cannot go without subjecting himself to penalties that he does not care to incur.

Therefore I say, "let well enough alone." What is needed and what the public will insist upon is a greater number of game protectors, made so by the State, paid by the State, and made to do their duty by the State, and unless this is done let all game laws be expunged from the statutes, and let every man kill, or catch, or have in possession, when or where he may, and the devil ought to and will do the hindmost.

STRACZE

### SPRING WILDFOWL SHOOTING.

I READ with pleasure the article in your issue of January 15, by "Upland and Bay Shooter," and heartily advocate the principles therein enunciated. It is not only eminently proper, but absolutely necessary, in order to insure the continued existence of migratory bird lands among us, to stop spring shooting. The sagacity of wildfowl is well known to observant sportsmen. They soon get "trained," and the continuous "bazing" of them in the springtime when they have alighted in our waters for quiet and rest for the purpose of mating, and while they are engaged in this sentimental pastime preparatory to their begonia homeward to their nesting places, makes a lasting impression upon them, and the consequence is that in the autumn, when the old ones are leading their respective broods southward, they take good care to avoid the places where their previous reception was accompanied by death and destruction.

Moreover, many times their eggs have commenced to germinate when they are killed in the spring, and the death or wounding of one is equivalent to the destruction of the old and the prospective young.

Notwithstanding it is pretty generally admitted that spring shooting is disastrous in its consequences and is rapidly driving all wildfowl from our waters, there are still many self-styled sportsmen who oppose its abolition. Their minds seem so completely imbued with the "harmless" world "two in the bush" principle, that they have entirely overlooked the necessity of first having the birds in the bush before they can get them in the hand.

The matter resolves itself into this simple question, viz.: Shall we for a very few years of poor spring shooting in present, absolutely destroy all shooting for the future? Shall the near future be absolutely sacrificed to the present?

In reference to the contribution of money from the different clubs for the purpose of paying the expenses of the game protector, I regard the suggestion as a good one. There should be yearly contributions and a yearly convocation of representatives chosen from each club in the State, the number of representatives from each society to depend upon its numerical force, so that whatever action was necessary to be taken would have the strength of union, and there has been the case, occasional epidemic and disintegrated efforts by a few individuals.

The only way to effectually establish a thorough game protective system is for the sportsmen in every part of the State to form game protective societies, then from each such society let representatives be chosen who will form a central organization, whose duty it will be to procure the enactment of proper laws leaving no society to see to their enforcement in its own particular locality.

There has always been a deep-rooted prejudice in the minds of our bucolic brethren against all game laws, and it is not until a recent date that legislatures dared even think of such measures. The injustice, severity and cruelty of the old English poaching laws are well defined traditions with them, and they still see visions of Rumymade before them, and all game laws and prosecutive agencies are still looked upon as relics of old world tyranny and infringements on natural liberty, and it is this prejudice that renders protection of game so difficult. The formation of societies as above suggested would greatly tend to overcome and show the foolishness of such prejudices in these times of highly moral ideas, and when such prejudices are overcome there will be no difficulty in enacting and enforcing all proper game laws.

GALESEN.

### NOTES ON BACK NUMBERS.

#### Editor Forest and Stream:

Your ever welcome paper reached me this A. M., and as usual it was full of items that were interesting and instructive. First your editorial on the People's Park. Now I don't know that I shall ever have an opportunity of enjoying the beauties of those grand old mountains, springs, etc., or shooting any of the game there, but this is of national interest, and I wish to thank you for exposing this big fraud.

"Nirard in the North" was read and enjoyed very much by myself and sons. We had learned much of Capt. Hall and Esquimaux Joe and the Arctic world from our own mounted Capt. E. A. Chas. at whose fireside we have passed many pleasant hours listening to descriptions of the northern country. Then "Upland and Bay Shooter" says he is in favor of prohibiting the shooting of water-fowl in the spring (so am I). May I ask how he stands on the woodcock and grouse close season? We, in the interior of the State, are particularly interested in these birds, and would like to have the close season September 1 to 15, have always found, when we have suggested this change, that Kings, Queens and Westchester counties, as a majority say, "We don't care what you have; we want summer shooting." But we have had summer woodcock and summer grouse shooting to such an extent that there are no birds left, and as "Nessmuk" says, "the birds must go."

I read "Fious Jeeimes'" article, and being a lover of the red Irish, began to look up some of the facts, and my limited experience of field sports found that some Irish dogs had been well to the front, and know that the Irish dogs had too many friends here to let this go by without the facts and figures. "Mont Clare" shows us that there are some level-headed Irish dogs, and I am just foolish enough to keep my little Irish bitch and hunt her another year before giving her away and buying a Llewellyn.

And now a word about Speaker Chapin's appointment of Cassius M. Goetz as Game Protector. They may be all in favor of the protection of game, but I know one that is not, or at least was not last year. "And by their acts ye shall know them." Mr. Schermerhorn, the representative from this district (not the true sportsman's or game protective representative, be he Democrat or Republican), tried to do all of the last year to help a bill through to allow the use of the swivel gun on the Hudson River in Columbia and Garrettsville counties. The swivel gun men told us that this year it will pass, as Schermerhorn is right where he can do more for them than he did last year. This being the case we ask the gentlemen composing the Committee on Game Laws that they will see that four or five men owning swivel guns are not granted the privilege of using these death-dealing machines (at 200 yards) on this river or in any part of this State. We are ready to see Mr. Schermerhorn and all the swivel gun advocates before the committee (if necessary), but know full well that there is not a man that would listen for one minute to any argument in favor of swivel gun. Leaving this in the hands of the gentlemen composing the committee (not Columbia's representative), I am yours,

HENSON, New York, Jan. 19

PLANKERS.

### SPESUTIA ISLAND NITRO HUNTERS.

[From the Baltimore American, Jan. 28.]

SPORTING circles in Baltimore were quite excited yesterday over the news that a raid had been made on the pot-hunters on the Susquehanna River. The interest in the affair is also heightened by the air of mystery which surrounds it. Exactly who instigated it is not generally known, beyond that it was done at the instance of the gentleman who owns ducking shores around the Susquehanna, Gunpowder, Bush and Back rivers, by club and individuals who live on the Potomac, the Ohio, the Delaware and the Susquehanna. A considerable comment over the raid here, as there are many gentlemen in this city who are fond of duck shooting, and who have had occasion to bemoan the decrease of the canvas-back. For a long time there has existed in and around Havre-de-Grace a gang of pot-hunters, who, armed with huge guns, mounted in skills, go out at night and slaughter ducks by the score, in the most reckless manner, but owing to the fact that some of these poachers are politically influential men, the law is a nullity so far as Harford county magistrates are concerned.

Last winter there was a law passed by the Legislature making the penalties more stringent. Since this the pot-hunters have become practically a band of outlaws, with a captain, whose name is Susquehanna, who has taken possession of a small island, which is about six miles below Havre-de-Grace, and made it their stronghold. No sportsman not in accord with the gang can shoot ducks in this neighborhood, as the poachers cruise around in their sloops all day, and by raising and lowering their sails purposely scare ducks away. Taking Spesutia Island as the base of operations, the pot-hunters conduct their business, which is remarkably lucrative. The poachers are sometimes terrible. These men kill ducks by means of what are known as "night guns." They are huge fowling-pieces, on the pattern of the ordinary shotgun, but weighing 150 pounds apiece, with a bore like a howitzer, and a capacity for at least a pound and a half of powder. A gun of this kind is mounted in the bows of a small skiff, which can either be navigated in water or put upon runners, and propelled over the ice. The poacher, sitting in a small boat, so that the recoil sends the boat back through the water, and there is no big shock as there otherwise would be. The gun is usually painted the color of the boat, some dull neutral tint, and is fitted with a patent buoy, by which the owner, if surprised by an officer of the law, can pitch it overboard and return for it again when the alarm is over. The sound of one of the guns can be heard five miles, and the effect of the shot is so great, as to keep deep water upon the water. There are instances recorded where eighty-five and one hundred canvas-backs were killed at one discharge. On account of this slaughter the law passed by the last Legislature imposes a fine of \$200 or imprisonment for each and every offense constituted by having in possession, using or disposing of any sink boat, sneak boat, big or swivel gun, or killing a duck in the night, time to any further adds that it is to be proved that any party so charged was at or about the place at the time when the duck was killed with a gun in his possession, it shall be deemed prima facie evidence for his conviction.

It was on the strength of this last section that Mr. John E. Semmes, acting as attorney for the parties who intended rooting the pot-hunters out of their lair, laid his plans for a raid. Proving the parties guilty before Harford county magistrates was long known to be worthless. What was

required was to get possession of the guns and confiscate them. The services of a Philadelphia detective were enlisted, and the operations of this shrewd man began the game. First he went to Havre-de-Grace and found out who the great duck killers were. Of course, nobody knew who they killed their ducks, but to these men the detective went, and being an engaging and companionable fellow, he made them all his friends. They took him down to the strong-belt on Spessart Island and gave him all the ducks, and he was very satisfied. They had splendid game patterns, and were willing to show him how to kill ducks from a bar or a blind, but never a chance did he get to go out in a snook boat with a "big gun." They were very reticent about these, and their hiding places for them were of the cleverest and most unsearchable character. The detective wanted to see the guns fired, so as to have unquestionable evidence. At last he was taken out with Wash Barnes, the great duck-killer, and the big leader of the poachers. On this occasion Barnes killed 104 ducks. Afterward the detective was taken out with another man, and was shown the modus operandi. With this evidence, and the knowledge of the fact that upon a certain day all the poachers except one would be away from the island, the detective joined Mr. Semmes, and they set out in a small boat from Havre-de-Grace for the island for the purpose of capturing the ducks. The detective knew where the ducks were hidden. Unfortunately, the river began to freeze, and after about five hours' hard pulling the boat became ice-bound when near the island. The two men were discovered by the sloops of the duck pirates which were cruising around, and three of them made a descent upon the yawl and its occupants. The law breakers suspected a raid and smelt a rat, and Mr. Semmes and the detective were taken aboard of Wash Barnes's schooner. The detective, relying on his friendship, and he was just bringing his friend, Mr. Henry, a Philadelphia banker, down to the island for a day's sport. In the cabin of Barnes's boat there were two Henry rifles, three double-barreled shotguns, and several revolvers. Suspicions were aroused, Mr. "Henry" got his day's shooting and went back without the "big guns."

Another raid was planned. This time two Baltimore detectives were brought into requisition and several special officers. The detectives were great admirers, and before yesterday the party made an attack on the island, armed with warrants for the arrest of Barnes and the other man, whose friendship had induced him to take the detective out in his boat. To the surprise of the raiding party, the poachers were found entrenched on the island armed to the teeth and prepared to make a desperate defense. It was afterward learned that a special officer who had been sent to Belair to be deputized by the sheriff had acted in an officious manner, and the duck-killers had gotten wind of the affair. There was a fix. There were eleven poachers in all, and about six in the party that had come to arrest them. The poachers swore that they would die rather than be arrested. Mr. Semmes hoisted a flag-of-truce and opened a parley. He told the men that he was going to arrest them anyhow, and that they had better submit. They would not better their submission, and the officers, fearing the crime of murder, whereas, if the officers of the law should kill any one in making the arrest, it would be a praiseworthy act in the eye of the law. The poachers considered this a knock-down argument and surrendered, thinking that at best they would only be taken before a Harford county magistrate. A "cute" provision of the law, however, allows the offenders to be prosecuted either in Harford or Baltimore county, and when Mr. Semmes took Barnes to Baltimore, he was going to slap them into jail at Towson, they begged for mercy. A compromise was then effected and Mr. Semmes promised that they should be taken before a Harford county magistrate, and that he would allow the law to take its course without argument upon the evidence if they would give up their "big guns." The men begged and implored, and even wept over parting with their guns, fearing that they would then be taken to jail. Mr. Semmes took them, however, and brought them to this city yesterday, when they were broken up and given to Winteritz, the junk dealer. They were enormous single-barreled affairs, painted a dirty white, and were both loaded. One of these guns is said to have been owned by old Captain Cadwallader, of ducking fame, and cost \$600. The lock was a beautiful piece of mechanism, and the metal was perfect. The barrels were about 18 inches long, and were released. The Philadelphia detective—who, by the way, has made himself very scarce—alleges that there are still eighteen of these guns in possession of the gang, which will doubtless continue its nocturnal depredations upon the ducks.

WHEN THEY COME AND WHY.—Cleveland, Jan. 15, 1888.—*Editor Forest and Stream:* The experience of your correspondent, Mr. Venzor, is that "the snowy owl" is more common about Montreal in exceptionally mild and open winters. Our experience here in Cuyahoga county, O., for the last four or five years, is that the bird comes from the North, generally about the last of November and remains never later than the last of January. I have never seen a specimen taken here after this month, and as a rule we have always considered their appearance the precursor of the winter storm. The owl, so far as I know, generally comes in about the first of the fall, and in the early winter of 1870 was a real staple from the Arctic regions between the Atlantic and Pacific oceans, and what an extremely cold winter followed. Now was this great migration of owls southward due to a short crop of ptarmigan, or something else yet to be explained? In fact, do you believe an Arctic owl can catch a full-fledged ptarmigan? I should think not. He might, at times, gobble up the fellow he has as a rule, but in the fall, when he is in the hawk-way, especially in the winter months, when he would like, most of all, ptarmigan dinners. As a fisherman this owl is quite expert, but does not catch his fish after the manner of the bold and honest fish-hawk. Considering the country this bird inhabits, his food must necessarily be of a "go-as-you-please" nature, of which we know but little. The same is true of his general history. Hall, the Arctic expert, says that he has only one far as I know, that was met with its nest and eggs. "What has become of the ptarmigan?" Perhaps many years of persecution to the race has taught them to avoid the Dominion?—*DR. E. STERLING.*

QUAIL IN CONSPIRACY.—(Westfield, N. J., Jan. 23.—The quail are coming freely (two I was able to leave from the ground, out through the snow) and I have bought a dozen wild ones, part of which I will turn out in the spring, and part will keep for quail breeding in confinement on a larger scale next year.—*JOHN J. WILLIAMS.*

## THE YELLOWSTONE PARK.

*Editor Forest and Stream:*

Inclosed I send you a copy of a petition I laid before the Kent County Sportsmen's Club, of Grand Rapids, Mich., on the 2d of this month, which was indorsed by the club and ordered signed by the officers in their official capacity and presented to Congress. I am not sure whether this is the first movement of a club on this subject or not. It is certainly the first I have heard of. I do not mention this boastfully, but I regret that the game and fish protective clubs and associations are not more active in their efforts to save the National Yellowstone Park from the spoliation that threatens it, especially as a game preserve. At the annual session of the Michigan (State) Sportsmen's Association, on the 9th inst., I laid a copy of the same petition before that body, which was unanimously indorsed and ordered signed and forwarded as above. I hope every association, society, and club will go and do likewise.

E. S. HOLMES.

GRAND RAPIDS, MICH., JAN. 20, 1888.

### THE PETITION.

To the honorable the Senate and House of Representatives of the United States of America in Congress assembled:

We, the undersigned, members of the Kent County Sportsmen's Club, of Grand Rapids, Mich., do respectfully ask your honorable bodies to enact such laws as may be necessary to secure the enlargement of the National Yellowstone Park by the addition of about forty miles of the national domain on the east and about ten miles to the south of said Park. We also, in addition, as recommended by Lieut.-Gen. P. H. Sheridan in his report of his recent summer trip to said Park.

We also ask that the control of the said Park be transferred to the War Department, and that the United States Army stationed in contiguous forts be instructed to protect all wild animals, especially game animals, of the air, on the land and in the waters of said Park, and to prevent any trespass within the boundaries of the same.

We also protest against the leasing of said Park or any part thereof to private parties.

And your petitioners, as in duty bound, will ever pray.

Some of the reasons for passing Senator Vest's bill may be found in the report of Mr. P. H. Conger, the superintendent of the Yellowstone National Park. Speaking of the vandalism of visitors and their utterly wanton destruction of the natural curiosities there, he says:

"I have hardly the patience to discuss this subject without passion. The most of the depredations committed seem to me so entirely purposeless that I am unable to conceive the cause that impels men to engage in so wantonly destroying a purely for destruction's sake. What are we to think of a man that will pack long poles, as heavy as he can carry, a great distance for the purpose of thrusting them into the cone and down the throat of these great geysers, when the only possible effect must be to obstruct their flow and mar their beauty? This is done repeatedly, although I have neglected no opportunity to warn, admonish, and entreat all tourists whom I have met in the Park and not on any account to do so. I have also, by published order, forbidden the collection of any specimens and cautioned all persons having occasion to build a fire in the Park to be certain to extinguish the same before leaving camp. But notwithstanding all this tourists go into the Park with iron bars and picks secreted in their wagons, with the express intent to disregard the law and defy the Superintendent. The famous geysers of the park are already badly defaced, and vast tracts of the beautiful forested land, the wonderland are laid waste by fire annually, through the wanton carelessness and neglect of visitors. Another source of great annoyance is the hunters in the Park. I am sure you will agree with me that it is not possible for a single game-keeper to guard so vast a territory as the National Park and prevent the breach of the laws in regard to the killing of game. The geysers, the hot springs, the waterfalls, and the mountains, which these vast solitudes afford, give me need no wonder that the laws are broken and the orders disobeyed. But I leave it for the superior wisdom of the Honorable Secretary of the Interior to suggest some remedy for these evils."

*Editor Forest and Stream:*

Allow me to congratulate you upon the fight you are making against the land grab in the National Park. I think that all the moral support possible should be given our representatives in Congress, and all others, who are trying to preserve this Park to its intended and legitimate uses. The famous Park says that the law is the law, and that our Senator Vest weakening in the investigation, for we do not believe any subsidy will be able to cause him to swerve from a plain line of duty. Please give us all the facts as they are brought to light in this investigation. OCCIDENT.

SEBASTIA, MO., JAN. 30, 1888.

[St. Paul Pioneer-Press, Jan. 22.]

The letter of Gen. James S. Brisson to Congressman Bedford, of Colorado, under date of Sept. 25, 1887, betrays his unselfish devotion to the cause of the frontier. He says that he is a sportsman, and that he desires to give to the people of the United States a National Park and desire to give to the picturesque shores of the lake from a palatial steamer or a white-winged yacht. He expected to make a million by extending to them the hospitality of the British hotel. The general is a self-sacrificing patriot, and doesn't believe in allowing a bloated monopoly like the Hatch syndicate to serve the dear public.

[St. Paul Pioneer-Press, Jan. 22.]

[St. Paul Pioneer-Press, Jan. 22.]

If a plain-spoken and well-written article ever appeared in public print it was the one in the *FOREST AND STREAM* of Dec. 21, in relation to the "Leasing of the National Park." Fair warning of gigantic fraud and outrage was given, and the result was that the National Park was always a map of unscrupulous and unprincipled schemers on hand to defraud the Government or its people, when the least show of even a pretense of resistance was shown. It is one thing to be throttled or checked in government matters than another puts forth blows, blossoms, and brings forth a hundred fold for the originator. The famous Park is not yet fully settled, yet the honest people are started by a new enterprise ("the Leasing of the National Park") to private parties, for private interests and private aggrandizement. The National Park is not yet fully settled, yet the honest people are started by a new enterprise ("the Leasing of the National Park") to private parties, for private interests and private aggrandizement. The National Park is not yet fully settled, yet the honest people are started by a new enterprise ("the Leasing of the National Park") to private parties, for private interests and private aggrandizement.

[Boston Star, Jan. 22.]

Gen. Brisson has no objection to the "Hatch party" "hog" the Yellowstone Park for all it is worth. He demands only a water privilege, worth a million or so within the next ten years.

[Pittsburgh Evening Chronicle, Jan. 22.]

The Yellowstone Park is a grand and beautiful thing, and Uncle Rufus may realize handsomely out of it with his virtuous and unsullied partners, but in the meantime the people understand the situation and are not so easily deceived. The National Park is a grand and beautiful thing, and Uncle Rufus may realize handsomely out of it with his virtuous and unsullied partners, but in the meantime the people understand the situation and are not so easily deceived. The National Park is a grand and beautiful thing, and Uncle Rufus may realize handsomely out of it with his virtuous and unsullied partners, but in the meantime the people understand the situation and are not so easily deceived.

Nobody objects to the erection of hotels in the Park. Speculators may build as many as they want to. What is objected to is the giving of exclusive rights to a few individuals to monopolize the Government gives something for nothing. Neither Mr. Hatch nor Mr. Coulting nor anybody else who has anything to sell or lend ever does business this way. But they will make their point. All the signs indicate it.

[Boston Sunday Herald, Jan. 22.]

The struggle for the control of the Yellowstone Park privileges has brought out some very interesting facts. General Brisson, who is stationed in that vicinity, has been granted the privilege of running one steamboat on Yellowstone Lake, and his published letters to Congressmen and Senators show his anxiety to have the privilege enlarged and issued exclusively to him. He estimates that the privilege will be worth \$100,000 for ten years. The scheme of the Rufus Hatch combination to "hog the whole Park" is very obvious to this modest monopolist, but he promises not to object if his navigation privilege be not interfered with. The action of the Assistant Secretary of the Interior in executing the absence of Secretary Teller, leases for seven tracts of land of 640 acres each, and including the geysers and other natural curiosities, has a very suspicious look. If there is not jobbery afloat in connection with this Park, the ear marks are misleading. The Senate has not moved any too soon to protect the Yellowstone country from its "protectors."

[Knickerbocker, Jan. 24.]

The Yellowstone Park fraud, which our able and reliable contemporary, *FOREST AND STREAM*, was the first to denounce, will bear a good deal of investigation. The last contention to the point, does a lot of letters on the subject in answer to Senator Vest's call for correspondence. This has opened a pile-hole full of epistolary trifles, by which we learn that General Brisson got the privilege of a steamboat on the lake for the convenience of "tourists" "convenience of tourists" is good. General Brisson, with a quick eye to the advantages of competition, writes to the secretary for an authority in writing to run his little boat, as those fellows, Hobart, Douglas, Hatch & Co., are going to gobble the whole Park. Our Assistant under-secretary, Joslin it was who, in Secretary Teller's absence, made the laws and gave rights and profits worth millions. Nothing for nothing is good political economy. What was Mr. Joslin's little share in the spoils?

[N. Y. Morning News, Jan. 25.]

The United States Government, now having a National Park on its hands, is chiefly engaged in proving to the world how incapable it is of doing it. The domain of the National Park is a vast one, and it is, after having set it apart and barred out the worthy settlers, it must now be given up to speculators. This appears to be another example of the kind of thing that has been done in the past, for the general benefit. A National Park was a new idea and a noble one. The hatch scheme is a very old one, and doesn't appear to be noble at all.

## A GROWL ABOUT GUNNERS.

NOTICE an article in your last on the "Indestructibility of Game Birds," from one of your correspondents. He admits that the wildfowl and snipe are frightened away by night shooting, and have got the gauge of modern choke borer down so fine that they can keep out of range. That is just what all of us "growlers" complain of. Nothing has done so much to drive away our wildfowl and snipe as the introduction of modern breech-loaders at a low price—a good one costs now no more than a muzzle-loader a few years ago. It is not the birds that are killed, but those that are scared away, that do the mischief.

The coast is lined with "stuckers" and "snipers" the whole season, everyone of whom own a gun, and so they must shoot at everything with feathers on, sea gulls, swallows, and the like. "What earthly difference does it make if the ducks and snipe are 'indestructible,' so long as they keep themselves where you cannot get at them. Your correspondent, who mentions that he has seen a duck shot where he has as good shooting as ever, but I notice that he takes good care not to advertise its exact locality. If he did, about one season would show him what is meant by scarcity of game birds. GROWLER.

NEW YORK.

OREGON GAME.—Cove, Oregon, Jan. 5.—For the past two weeks we have had a cold snap, with snowstorms, ice and slush following each other. Shooting has been pretty fair among the prairie chickens, ducks, jack rabbits and large game. Geese have left for a warmer climate. The sharp-tail grouse, called here "chickens," during a snow storm frequently settle in the trees on the streets, and are shot from the houses. Notwithstanding the depth of snow, the game is good, and the shooting is good. On Monday, yesterday two of us went down some half a mile, walking near a warm creek still open, and found plenty of game. Ducks, to protect themselves from the wind, were under the banks and bushes, and as we turned sharp crooks in the stream, they would rise almost under our feet, only to fall with a bound right and left. Now and then "chickens" arose with a whirr from the snowbanks and thickets. When again settling the snow would prevent us from getting at them. Almost before taking wing. They afford the finest of the finest of shooting when the weather is cold and snow covers the ground; but when the snow disappears the birds are wild and difficult of approach. My companion, noticing fresh tracks of a jack-rabbit, followed them only a short distance when it jumped up near by and was brought to bag. They are almost invisible now, being white. We made two particularly fine shots, bringing down a pair of mallards at seventy yards high. After a half day's sport we returned with one mallard, six ducks and twelve chickens.—*J. G. S.*

NEW JERSEY QUAIL STOCKING.—Plainfield, N. J., Jan. 29.—The first installment of three hundred live quail for stocking purposes, ordered by the New Jersey Game and Fish Protection Society, arrived at the headquarters of the society in this city last week, and are doing finely. The birds came from the Indian Territory, through Reich Bros., New York, and are in good condition. They have been placed in excellent quarters and are receiving every attention necessary to their welfare, until the proper time arrives to turn them loose in the various counties of the State destined as their future homes and breeding places. The society is in flourishing condition, and rapidly increasing in membership. Non-residents desiring to become members should address the Secretary, W. S. Force, Plainfield, N. J. There is a prospect of more quail being left over this winter than in many previous years. The writer knows of several broods which were saved over from last fall's shooting in this immediate neighborhood, by the exertions of members of the society, who would not shoot them themselves, nor allow others to do so as far as lay in their power, fearing that the birds would sport in vain, and the birds would increase in numbers and thus afford better shooting in the future. Grouse are scarce in this section. No important changes in the game laws are likely to be made by the present Legislature.—*FOX.*

MIGRATORY QUAIL.—New York City, Jan. 27, 1888.—Will you be kind enough to publish in your esteemed paper, the any and every desired information, and, if possible, from the next spring can obtain all information, etc., by applying to the undersigned, 46 Beaver street. Over 13,000 quail have been imported through me from Mexico to this country.—*CARL F. BRAUN.*

## Camp Fire Flickerings.

"That reminds me."

WE were sitting around a roaring fire in the "Dawn of Day" cabin. We were the day shifts on the "Orphan Girl" and the "Maggie." The storm was roaring outside, but loud as it howled its noise was drowned by our peals of laughter, for in the center of the circle, seated on an inverted cracker box, was "Yunk," boss liar of the Rocky Mountains. For two mortal hours the tears had been streaming down our faces, making strange looking white streaks, for we had followed his trail from "The first time I crossed the plains, boys, in '49," and "I tell you, fellows, it makes a man think of his wife's people when the arrets is comin' at yer ping, ping, ping, straight as a clothes line fifty yards long and not an inch between 'em," until we landed him "in the San Luis Valley wit'out chuck or water, blinded wit' sandstones," surrounded by Indians. Then somebody said "antelope."

"Wal, now just listen to me boys and if any of yer can discount a strange coincidence that happened to me in that that same San Luis Valley I'll throw up my hands and take water. Yer see we had been out of meat for over a week, having eaten the last of a dead mule we found that was so tough the coyotes couldn't touch him, and we was gettin' kind o' peckish, when one evening, just as we was makin' camp, what should I see but a doe antelope. Down I drops and, boys, I tell yer I did some tall stakin' right that that would have turned a 'Pache yaller with envy, but just as I got within shoothin' distance somethin' skeered the doe and off she went on the dead jump. But meat I had to have, so up I jumps and led drive, but, what with bein' weak with hunger and frin' in a hurry, instead of hittin' her behind the shoulder I just crashed her across the belly, when, as I'm a livin' sinner, without breaking her stride she just dropped two fawns, who lit on their feet a runnin' and all three disappeared together. Good night." A. B. B.

You may send the writer who believes in hunting without a gun, out here in the spring when ducks come. I claim him for a pardner.

Was hunting last fall up near Malta Bend, as fine a duck country as there is anywhere. I think, and I believe I hunted part of the time without a gun. It happened this way. It was just in front of a storm; and the ducks were flying thick and rapidly. I unloaded my traps from the wagon and plunged into the long grass that lines the shores of a lake that never fails to bring duck and geese in spring and fall. The point I was making for was about a mile from where I started in, and by the time I got there I had killed eight. Just before I got in position to "slay 'em," a very fine looking setter dog came to me and anchored himself as though he meant to see the fun.

Here come the ducks by the hundreds over the point of timber; they pitch down and skim along, giving a fair shot with both barrels; and down came three ducks fat and sleek. The dog retrieved them in a workman-like manner. Hurriedly putting away shells in the gun, I did not notice that one of them was wet; and when I emptied the gun the next time that "settled it," I could no more get that shell out than I could fly. The ducks come thick and fast, and almost sat on my head; and the look of disgust that that dog would give me, when I would fail to shoot as each flock came sailing over us, was too comical to describe. I was as completely without a gun as the writer of your article could wish. This condition of things could not last long; and finally the dog struck out, I suppose for home; and I struck out for the wagon.

It may be that there is something in hunting without a gun, but it certainly is not satisfaction. J. D. A.

MARSHALL, MISSOURI.

## Sea and River Fishing.

To insure prompt attention, communications should be addressed to the Forest and Stream Publishing Co. and not to individuals, in order that the office matters of importance are liable to delay.

Ye Nymphs of Mulla, with which careful heed  
The silvery trout do fond full well,  
And greedy pikes which use therein to feed  
(Those trout and pikes all others do excel);  
And ye, likewise, which keep the rusty lake,  
Where none do fishes take;  
Bray up the locks which hang scattered light,  
And in his waters, which your mirror make  
Behold your faces as the christall bright."

—Epithalamion, (1595).

### MCCLOUD RIVER TROUT.

BY LIVINGSTON STONE.

THE question has been raised, "Is there more than one variety of black-spotted trout in the McCloud River, California?" It is settled beyond question that the McCloud River contains *Salmo iridia*, the coarse-scaled trout of the McCloud River proper, that grows to a weight of eight or ten pounds, the trout with the obtuse nose and large eye, with the bright red gilt covers and the broad red band along its body. We know that this fish is in the McCloud River, for there are hundreds, thousands indeed, in the ponds of the U. S. Fish Commission on the McCloud, which have been caught in the river and placed in these ponds, from time to time, but the question remains, is there another kind of black-spotted trout in the ponds or in the McCloud River itself scaled and differently shaped?

With special reference to this question, I took a day to examine the trout in the U. S. ponds on the McCloud River. These fish, two or three tons in all, were caught in the river and tributaries, and all, or nearly all, are above two pounds in weight, and probably all are over two years old.

After a thorough examination of the fish, both alive and dead, I am compelled to give it as my opinion, which I admit is nevertheless not based on a scientific study of them, that there is only one variety of black-spotted trout in the U. S. ponds on the McCloud River, or if there are two or more varieties they shade into each other by imperceptible degrees.

It is the opinion of Mr. Myron Green and Mr. Loren Green, who have had more experience with these fish than any other white men, that there is only one variety of trout in the U. S. trout ponds and in the McCloud River, or if there are more that they breed together indefinitely,

so that all specific characteristics of distinct varieties, if there were any, have become lost.

One thing is certain, which is, that if there are two or more species of trout in the ponds, the eggs distributed from these ponds are the fruit of an intermixture of both or all the varieties, for all the males and females in the ponds are used indiscriminately in the egg-taking season and all seem to be equally efficient in producing fertilized ova.

The only distinction which the writer could discover between the so-called fine-scaled and the coarse-scaled varieties was simply this, viz., that the larger fish in the river were coarse-scaled, and the smaller in the brooks and flow into the river were fine-scaled. This holds true universally. It is the general opinion on the river (which opinion the writer shares) that the trout in the river are the same variety as the trout in the brooks, but that the younger and smaller trout affect the brooks and the larger and older trout prefer the river. According to the generally received nomenclature in the Eastern States, I suppose the brook trout would be called the fine-scaled or mountain trout (or *Salmo charit*), and the coarse-scaled or river fish would be called the McCloud River trout (or *Salmo iridia*).

I confess the subject is very much of a puzzle to me still, particularly because persons who have hatched the California trout eggs and have raised the fish from them, are very positive that what are called the "California mountain trout" and what are called the "California McCloud River trout," are two distinct varieties, while according to my theory they ought to be both the same variety. Mr. Roosevelt speaks very decidedly about it, and says that "the distinctions between the McCloud River and the mountain trout are quite apparent to the eye," that "there is some difference in their habits," that the mountain trout does not grow to more than half the size of the McCloud River trout, and that when cooked there is a marked superiority in favor of the mountain variety. These, I believe, are also Seth Green's opinions.

Now if this is all true, and I do not here dispute it, how does it happen that we have but one kind of trout in the ponds of the U. S. Fish Commission on the McCloud River? Our trout there have been taken indiscriminately from brook and river, and if there are two distinct varieties in the brook and its tributaries it seems impossible that both varieties should not be represented among the thousands of trout in the ponds, but they are not. I do not pretend to solve the problem, and will only add in closing that in the ponds of the Lenni Fish Propagating Company, in California; I saw many thousand fish, all of which were alike and all different from those in the U. S. ponds on the McCloud, the main differences consisting in the shape of the head and the greater number and different localities of the black spots, the heads of the Lenni trout being less symmetrical and graceful than those of the McCloud River trout, and the spots extending over the abdomen and lower fins, while in the McCloud trout the spots are absent on these parts.

### TROUT. HOGS.

IN your Journal of January 18, "Nessmuk," in his article "A New Year's Seren," in speaking of the trout he speaks of a sample of that species of fishermen who fish for numbers and not for weight that I met on the Neversink two summers ago. I started in one fine June morning at Mable's clearing on the West Branch, to fish down a little below Rosencrance's clearing, where a team was to meet and take me over the mountain to the Big Indian; there I was to meet a friend and try that stream for a few days.

I did make but a few casts when I discovered prints of hob-nailed shoes in the moist sand, and knew there were fishermen ahead of me. So I took it leisurely, not wishing to follow too closely behind them. Trout rose in large numbers, but few large trout came, and, as is usual on streams in that locality, about six were returned to the water where one was dropped in the creel, but I was satisfied with my luck, for a few fair-sized fish had been taken. The day was as near perfect for trout fishing as could be wished for, with no wind to interfere with casting stream in perfect condition, and what more could one wish? But there are too many men who go for the fish, not for the fishing. I enjoy the fishing, that is what I go for, and if the fish are there, so much more pleasure.

About 3 P. M. I reached the little tumbled down log bridge near Rosencrance's clearing, and as I stepped up on the bank I heard a voice, "falloo, what luck?" I looked around, and saw no wind, under an old butternut tree, which stood a little way back from the stream, reclined two very nobly-looking fellows smoking cigarettes, and a quart flask with a shoulder strap was very conspicuous in the foreground. They had rested their rods against the tree and one of them had fallen down, the line having caught in the branches, the rod was bent in nearly a half circle, the tip being supported by the line, and the sun was shining full upon it. They invited me to come over and see their catch, and the following conversation took place:

Nobly Angler No. 1, reaching for the flask—"Have a drink?"

Myself—"Thanks, but I don't use liquor much in hot weather."

N. A. No. 2—"Oh, have a drink. Cool you off."

Myself—"I am obliged, but please excuse me."

N. A.—"Have a smoke," offering a bunch of cigarettes.

Myself—"I'll smoke a pipe if you have no objection," and I produced my briarwood that had been my only companion on more than one fishing trip.

N. A. with a contemptuous twist of his nose at so vulgar a thing as a briarwood pipe—"When did you start in, had any luck?"

Myself—"I started in at Mable's, took about thirty-five I guess."

N. A. with another twist of his nose—"Didn't do much, did you?" and in an off-hand manner, "We got about three hundred." He then took a pull at the flask that almost made it collapse and caused the other N. A. to reach for it with a look that was appalling.

Myself, giving a couple of pulls on my pipe—"Got very many large ones?"

N. A. No. 2—"Large ones! There ain't a cussed trout in the ponds on the McCloud that's larger than the ones I take. We have tried all kinds—blue, grey, scarlet fish, green heckle and everything—and then had to fall back on bait, which I never like to use, but without it a fellow can't get a showing of trout to-day." and he went down to the stream and pulled out two creels, where they had been soaking for a couple of hours, and brought them up for my inspection. I should say there were three hundred trout in the two creels, neither

of which was more than two-thirds full, and I could not find a trout more than six inches long, and those had to be looked for. By this time one of the fishermen so far forgot himself as to look in my creel, which only contained thirty-four trout. He nearly dropped the basket, and looked as if it was in order.

"Where in thunder did you get those trout?" Thunder was not the word he used, but I substitute it for one which might set the paper on fire.

"I caught them between here and Mable's."

"N. A.—"The devil you did! Have a drink?" I had set my rod against a small tree when I stopped to converse with the fellows, and one of them now took it up and began to switch it in a manner that caused me to regret having let it out of my hands. It was one of my pet rods, and I loved it.

N. A., as he gave it a switch, the tip striking in a bush behind him—"This feels like a Mitchell rod." "Did he make it?"

Myself, rather sharply—"No, I made it myself. He looked at me, but refrained from calling me a liar.

N. A.—"Did you catch your fish on these flies?"

Myself—"Some of them. I have changed all my flies several times, excepting the beaverkill, that has done good work all day."

N. A.—"Which is the beaverkill?"

Myself—"The second dropper."

N. A.—"I guess I'll make a change in my flies."

He drove his hand down in a spacious pocket in his fish-vest, and drew forth a book, a trifling smaller than a Webster's Unabridged Dictionary, which was well stocked with salmon and bass flies. He had nothing that looked like a beaverkill fly, and I gave him a couple from my Holberton fly book. On seeing my book he said he should think I would get out of flies if I didn't take more than four dozen on a trip. I told him I had some in my valise at the house where I was stopping. He said he thought I was about burnt out, and didn't know as there was any in carrying such a lot of truck around on a fishing trip. I told him I thought it quite unnecessary to carry a satchel full of salmon flies on the Neversink.

The sun was getting behind the hills, and as I wanted to reach the wagon before nightfall I bade the N. Anglers good day, lighted a fresh pipe and started down the stream.

I know a good many anglers like the ones I found under the burnt tree, and I know a good many trout fishermen, who seem to think it a disgrace to be outbaited, no matter what the size of the fish may be. NEVERSINK

FISHERMAN ON THE NEVERSINK.

### FISH POISONS.

SOME time ago I was present where there were several gentlemen, and the conversation chanced to turn upon fishing, fish, and fishbait. I remarked that in my boyhood I had seen fish caught by something thrown in the water; the fish ate it eagerly and then appeared to go crazy, and the drug, or whatever it was, was called crazybait. I remember this, the fish, after eating it lost all fear, and you could go into the water and catch them with your hands, or spears, for I have to go on. After no longer being so near being drowned once at that sport. It was after my father came to California, in 1854 or '55; he had sold a ranch we had been living on a short time and we went into camp again until he could suit himself with another, and for convenience to water, we pitched our tent near a large bayou making out of the Sacramento River, and very near us was a large, deep hole in which it was supposed there were good fish. I went to the hole, and after no longer being so near being drowned once at that sport. It was after my father came to California, in 1854 or '55; he had sold a ranch we had been living on a short time and we went into camp again until he could suit himself with another, and for convenience to water, we pitched our tent near a large bayou making out of the Sacramento River, and very near us was a large, deep hole in which it was supposed there were good fish. It was after my father came to California, in 1854 or '55; he had sold a ranch we had been living on a short time and we went into camp again until he could suit himself with another, and for convenience to water, we pitched our tent near a large bayou making out of the Sacramento River, and very near us was a large, deep hole in which it was supposed there were good fish. I went to the hole, and after no longer being so near being drowned once at that sport. It was after my father came to California, in 1854 or '55; he had sold a ranch we had been living on a short time and we went into camp again until he could suit himself with another, and for convenience to water, we pitched our tent near a large bayou making out of the Sacramento River, and very near us was a large, deep hole in which it was supposed there were good fish. In that kind of weather one should go about sunset. I recollect one little occurrence that happened years ago, when I was a boy, that I must relate. It was on one of those warm, muggy days known as dog-days, in the month of August. Taking my rod one afternoon, I went down to Sebago Pond, where I had some fine luck the first of the season, fishing around fallen bushes. Arriving there early in the afternoon, when the sun was shining quite hot, I sat down under a tree and cooled and comforted myself, and then adjusted my tackle. I put on a worm and caught a few chubs for bait. Cutting off several as tempting-looking baits as I could, I put one on my hook and walked along to the bushes and began to fish. I had never failed to have good luck, and consequently I expected a bite every time I threw my bait, but nothing seemed to care for it. I fished over an hour without a bite, when happening to look down under the leaves in the water, I saw a large pickerel lying there as quietly as though nothing had been around. Winding in some line, I lowered my bait down in front of him, but he refused to take any notice of it. I got tired of trying to get him to take the bait, and putting up my rod, I started for home, with the determination of giving that fish a waking up next day if I could find him. I got home and fastened three large hooks together, so as to make a first-rate grapple. The next afternoon I went back prepared to find him, and I did not fail. I saw him, and he took the old fellow in another place, not far from where he was the day before. Putting on a bait, I tried to tempt him out, but he refused to stir at all. Taking off my bait and hook, I adjusted the grapple. Lowering it carefully down under his tail, I gave a good yank and succeeded in hooking him just behind the back fin. He was thoroughly wide awake about that time, and never in my life did I enjoy myself so. I told him and he never did I see a pickerel handle himself as he did. But it was of no use, I had him securely hooked and after a while I reeled him in, and he weighed six and three-quarter pounds. I shall always remember that—PICKEREL.

**TROUTS OF LAKE HURON.**—I noticed no less than three distinct species of lake trout brought in at Alpena last fall, besides many variations in color, etc., according to the runs and localities from which they were captured. The blackjaw species predominate in numbers; these, I suppose, are the most common. Next in abundance were the "Buckskins," as the fishermen call them; this variety has tougher, more leathery skin (hence, I suppose, the name buckskin), and is lighter in color and weight. Then come the racers, which are comparatively scarce; luckily, too, as they must be terribly destructive, having a mouth and head of immense proportions—altogether disproportioned to the size of the body, taking the other species as the standard of comparison. These are especially antagonized by the fishermen.—S. BOWEN.

**ICE FISHING, Erie, Pa., Jan. 24.**—The fishermen are having fine sport fishing through the ice on the bay, at Erie, Pa.; the catch is mostly yellow perch, though some of the lucky ones sometimes hook a black bass and frequently a good sized pickerel. Herrings have not put in an appearance yet; they go to hundreds of men and boys may be seen on an acre of ice near the channel.—HEADLIGHT.

### SALMON AND SHAD IN THE MERRIMACK.

THE Lowell, Mass., Courier says: "Representative Varnum has introduced a bill in the Legislature which removes restrictions upon fishing in the Merrimack with net or seines certain months in the year, the proposed enactment being intended to permit the catching of shad with seines in the Merrimack to a point above this city. The fish name are used for bait in pickerel and other fishing."

Warren Ordway writes to the Haverhill, Mass., Bulletin: "The fishermen of that river, and those below Lawrence, have waited for twenty or thirty years upon the experiments of the Fish Commissioners to restock the river with salmon and shad. They have waited in vain, for nothing of any consequence has been accomplished. The fish do not come into the river now as of olden times, and there is no good reason why the stop-laws that relate to the fishing in Merrimack river should not be repealed. The spawning grounds on the river and its tributaries are all shut off, and the fish have given up their homes to catfish and dry staff. Let every town on the river petition for the repeal of these useless stop-laws and let the people, if by chance they can catch a stray shad or salmon, have the privilege of eating it honestly and by daylight."

The Lawrence, Mass., American says: "Mr. Edwin F. Hunt, of Newburyport, who was directed to make observations in the river by the Fish Commissioners, states in his report that soon after the Pacific river when a large amount of dyestuffs and other chemicals flowed into the river, report came to him that a large number of dead salmon were to be found on the shores of the river. He made a careful inspection of both banks, and found one dead salmon below Merrimack bridge, and six between Lawrence and Haverhill. He is convinced that this is the extent of the injury done to the fish, although reports multiplied them into hundreds."

### FISHWAYS FOR MARYLAND.

The following is an extract from the fish law of the State of Maryland, section 15, "C" of chapter 440, acts of 1882:

"The commissioner of the western shore of the State shall cause to be erected, on the Potomac River, during the next ensuing year after the passage of this act, suitable fish-ways or ladders, whereby the fish may be able to ascend over the said dams, and the sum of twenty-four hundred dollars, or so much thereof as may be necessary, is hereby appropriated for that purpose."

Section 15, "D." The owner, or owners of all dams (except the canal-dams) now erected, or hereafter to be erected, in or across the Potomac River, or streams running into the said river, upon which dams are accustomed to be erected, shall make and keep in repair, properly constructed fish-ladders or fish-ways, to be placed on said dams so as to afford to the fish in the said river or streams, free course up and down said river or streams, and the said fish-ladders or fish-ways shall be approved by the Fish Commissioner, and if any owner or owners of such dams shall fail to comply with this provision within six months after notice has been served as hereinafter provided, he or they shall be guilty of a misdemeanor, and shall be liable to a fine of not less than three hundred dollars, nor more than five hundred dollars, and such dam shall be deemed

a nuisance, and liable to be abated as other nuisances under the laws of the State.

Section 15, "B." The county commissioners of the county along which a dam or dams erected now or hereafter to be erected, in or across the Potomac River, or streams running into said river, when satisfied that said dam or dams are so constructed as to cut off the fish from free course up and down said river or stream, shall give notice to said owner or owners to construct and keep in repair proper fish-ways or ladders as hereafter provided.

Section 15, "H." This act shall apply to the Potomac River and its tributaries only, above what is commonly known as "Little Falls of the Potomac."

Section 15, "I." This act shall take effect from the date of its passage.

Approved May 3, 1882. (In this connection we learn that Mr. Delawder, the Commissioner of Fisheries for the western shore of Maryland, has approved of the McDonald Fish way and the McDonald Fish-way Company are now engaged in building several of them on the canal-dams on the Potomac River. The company has bought the exclusive control of the patents on this fish-way and is preparing to erect them in all parts of the country. To meet the wants of mill owners on small streams they have designed a form which may easily be built of lumber by any carpenter, and at a very small expense.)

**LAND-LOCKED SALMON FOR NEW HAMPSHIRE.**—Plymouth, N. H., Jan. 24.—Sixty thousand Scotch salmon eggs were received at the State hatchery to-day from Grand Lake Stream, Maine.—H.

### FIXTURES. BRANCH SHOWS.

February 20, 21, 22 and 23, 1888.—Grand International Bench Show, Washington, D. C. Entries close Feb. 12. Chas. Lincoln, Superintendent, Office, Stating Clinic, Washington, D. C.

March 20, 21 and 22, 1888.—Boulevard of the Kennel Club Bench Show, at Ottawa, Canada. Charles Lincoln, Superintendent.

April 3, 4 and 5, 1888.—Western Pennsylvania Poultry Society's Fifth Annual Bench Show, at Erie, Pa. Entries close Feb. 12. Chas. Lincoln, Superintendent. For English setters whelped on or after January 1, 1882, close February 1, 1888. Chas. Lincoln Superintendent. C. B. Elbin, Secretary.

May 8, 9, 10 and 11, 1888.—Westminster Kennel Club, Seventh Annual Bench Show, Madison Square Garden, New York City. Chas. Lincoln, Sup.

To insure prompt attention communications should be addressed to the Forest and Stream Publishing Co., and not to individuals, in whose absence from the office matters of importance are liable to delay.

Owing to the illness of the Kennel Editor, any communications are deferred.

### WASHINGTON BENCH SHOW.

EVERYTHING looks very well here for a successful show. The applications for entry blanks have been more numerous than expected. One thing is very gratifying to say, they come from all parts of the country, and what is more important to us, that most of their owners are coming with them, so that they may take in the sights of the gay capital, and also celebrate Washington's Birthday.

The Erie Railroad will carry one or two dogs free, but in all cases the owner must accompany the dog. For N. Abbott, General Passenger Agent, 21 Cortlandt street, New York. The Pennsylvania Railroad Company will carry dogs in their special cars, fitted up expressly for the transportation of dogs, for a very small charge.

The express companies will return dogs free of charge to the original shippers, providing they have paid their usual rates to the show.

Tiffany & Co. give \$100 cap for the best trio of sporting dogs. The Hon. John S. Wills, of Richmond, Va., will judge English and Gordon setters; also pointers.

Mr. C. H. Mason, late of Bradford, Yorkshire, England, will judge Irish setters, spaniels, fox-terriers and miscellaneous. Mr. Wm. Ward of New York, will judge mastiffs, St. Bernards, Newfoundlanders, collies and all small non-sporting dogs. The entries close 12th of February, and it is earnestly requested that entries be made as early as possible, as the space is limited.

CHAS. LINCOLN, Superintendent.

### NEW ORLEANS CLUB. NEW ORLEANS.

The cold wave that struck here last week had the effect of waking up the members of the New Orleans Club, and our leading gun stores were under the necessity of employing an extra force of men to fill orders for loaded ammunition. It had one good effect, at all events, for the subject of dogs and guns became the leading topic of conversation whenever two or more sportsmen would meet, and finally brought about a meeting of the New Orleans Gun Club.

This was the first time a question of that organization could be obtained since their late field trials at Opelousas, and as a great deal of business, old and new, was before the club, the meeting was necessarily a prolonged one.

The principal business before the club was as to a question of another field trial, its location and prospects of success. It was clearly demonstrated at Opelousas that the season was too early in that locality to display superior field work on the part of the dogs, as the weather was excessively warm and the cover heavy beyond description. The decision of this matter finally resulted in the club's decision that they give a field trial, this fall, immediately following the one to be given by the National American Kennel Club, and at a point convenient of access from Grand Junction.

The question as to what should comprise the various stakes drew forth an almost unanimous opinion that the Derby be left out and in its place one should be substituted to be known as the "Championship Stake." The stakes will be open only to those dogs who shall have won a prize in some previous All-aged Stake, and as it will be open to winners throughout the world, the winner in this stake to be known as the "champion of the world." It will be the sole event of the day or days of the trial, and ought to result in a battle of the giants, so to speak. There will be a valuable prize, of course, but the honor of owning the champion of the world will count for something. The other stakes in these trials will be the "Memorial Stake," the "All-Aged" and the "Two Year Old" prizes, and the amount was ordered placed to the credit of a future field trial fund.

The secretary read a letter from Mr. Washington A. Costar, secretary of the Eastern Field Trial Club, enclosing a copy of the resolutions adopted by that club in the case of Mr. Wm. Tell Mitchell for breach of field decorum at High Point, N. C., and requesting this club to act in concert with him in carrying out his banishment. The resolutions of the Eastern Club are as follows: "Resolved, that any owner and owners as shall be debarré by them in the future. The reading of this letter brought forth a resolution that was unanimously carried, i. e., "That this club shall recognize

the acts of any similar organization in barring from participation in field trials any owner or handler who shall be guilty of conduct unbefitting gentlemen, or who commit a breach of field decorum."

The other business of Mr. H. M. Short, the handler of Sue, Peep-o'-Day, Pink B., and other dogs at Opelousas, who was barred by the executive committee from participation further in the then trials, and any future trials given under the auspices of the National Club, was then taken up. The committee and the action of the committee was unanimously sustained. It was shown that Mr. Short was guilty of gross impropriety, both as to language, threats and actions. The committee had acted promptly in his case, but out of consideration for the owners the dogs he was handling and from the fact that none of said owners were present, their action was far more lenient than the gravity of the case required. They addressed to Mr. Short the following letter:

OPELOUSAS, La., Dec. 11, 1882.

Mr. H. M. Short: Dear Sir—The remarks attributed to you, and circumstances attending your withdrawal from the field this afternoon, are of such a peculiarly disagreeable character to this committee that in doubt as to your intentions with regard to a continuance in these trials on your part as handler of the balance of your entries, we cannot but insist that such continuance be preceded with full apology to the judges and this committee for a breach of field decorum and a violation of the rules such as we cannot permit to pass unmentioned, and we must state, and we must state, that you establish yourself in the good will of the judges and this club purely from considerations of the highest regard for the Messrs. Bryson and other gentlemen you represent.

E. L. RANLEY, Jno. K. RENAULT, Ex. Committee.

The committee gave him until the following morning in which to tender an apology before final action was taken, to which letter he refused to reply, and he was not allowed to run any dog afterward. The committee regretted the necessity of having to pass so severe a sentence on a man who, naturally, is one of the best of the breed, and the best of the trainers of dogs in the South. He is uniformly kind to his dogs and is very well thought of by those who entrust their dogs to him. The writer speaks from personal acquaintance and furthermore, and furthermore, the committee, addressed to members of the committee have been received, asking them to be as lenient as possible in his case and try to have him reinstated.

The meeting of the club was in every respect a harmonious one. A field trial committee is to be appointed at once, and begin their labors. The entrance fee in the stakes this year will be the same as last, namely, \$5 to each stake, while the cash prizes will be much larger. You may rest assured that the coming trials of the N. O. Gun Club will prove a greater success than the last was. Fox Hunt.

NEW ORLEANS, Jan. 25, 1883.

### THE ENGLISH KENNEL CLUB TROUBLE.

ONE of the peculiarities in the constitution and temperament of our English cousins is their bluster whenever any aspersion or even anything with the slightest tinge of insinuation is made against their country, the people, or their institutions.

We say bluster, for the old picture of a man behind the thin veil of "Briton's never, never will be slaves," we find there a slavish adherence to antiquated notions, and anything that has as its claim the fact of there being a precedent in the days of Charles I. for its observation, are sure to find a ready adherent. The Emperor sitting on the shoulders of the next in authority in the country, complacently fanning himself; he is in turn perched on a secondary grade of mandarin, and so on, until the old picture of a man behind the thin veil of "Briton's never, never will be slaves," we find there a slavish adherence to antiquated notions, and anything that has as its claim the fact of there being a precedent in the days of Charles I. for its observation, are sure to find a ready adherent. The Emperor sitting on the shoulders of the next in authority in the country, complacently fanning himself; he is in turn perched on a secondary grade of mandarin, and so on, until the old picture of a man behind the thin veil of "Briton's never, never will be slaves," we find there a slavish adherence to antiquated notions, and anything that has as its claim the fact of there being a precedent in the days of Charles I. for its observation, are sure to find a ready adherent. The Emperor sitting on the shoulders of the next in authority in the country, complacently fanning himself; he is in turn perched on a secondary grade of mandarin, and so on, until the old picture of a man behind the thin veil of "Briton's never, never will be slaves," we find there a slavish adherence to antiquated notions, and anything that has as its claim the fact of there being a precedent in the days of Charles I. for its observation, are sure to find a ready adherent. The Emperor sitting on the shoulders of the next in authority in the country, complacently fanning himself; he is in turn perched on a secondary grade of mandarin, and

For these reasons, as well as to obtain the valuable adjunct of a habitation in small boats, and lead their owners to an appreciation of a quality of sport much above that of aimlessly skipping about in some puddle with an unsatisfactory death trap, we have sought to further the introduction of healthy, but not under-rigged yachts, of small first cost. Their outfit in detail, size of sails and number of kites is much a matter of individual fancy, to suit each man's purpose. We should mention, *en passant*, that the publication of lines

ANETO.—Of the inside ballast of this yawl, illustrated in last issue, 1000lbs. are to be of lead cast to fit frames, rest in loose pig. Cabin will be upholstered in plush of a shade known as royal blue. The area of the topsail, jibheader, will be 65sq. ft., and the spinnaker, also to be used as a balloon jibtopail, will contain 125sq. ft. Jib and mizzen balance and an easy helm with mainsail only. There are two lines of reef knifiles in the latter dft. apart. Topsail bent to bamboos and cut with iff. roach on foot. Cooking gear consists of an Adams & Westlake oil stove with cast-iron reservoir.

**NEW CUTTER**—We have received photo and draught of a new cutter in course of construction for Mr. G. H. Winans, of Kalamazoo, Mich. Length over all, 25ft.; waterline, 23½ft.; beam extreme, 5ft.; draft, 4ft.; depth of hold, 14ft.; cabin, 9ft.; galley, 6ft.; head room under low beam. Has 2,000 lbs. iron on keel. Hoist of mainsail, 18ft.; boom, 21ft.; gaff, 13ft.; topsail, 20ft. on bluff; fore sail, 20ft. on stay; jib, 27ft. on bluff; mast, from end of loadline, 9ft. bowsprit, outboard, 10½ft.

**BUTTERFLY.**—The new four-beam cutter for Mr. Ed. Burgess Boston, has a displacement of 13.8 long tons, equal to 15.4 tons of 2,000lbs. Her lead keel weighs 16,520lbs., or 8½ tons, and it is expected she will take only 1½ ton more inside for trimming. Ratio of ballast to displacement is therefore as 8½ to 15 or 0.57 of displacement. Lower sail area 1,680 sq. ft. for cruising only.

**SINGLE HANDED.**—In Mr. Buckman's new 21ft. single hand yacht building at West New Brighton, there will be a 15in. floor and 4ft 10in. head room under a house 12in. high at crown of center. The yacht is 18ft. on load line, with 7ft. beam. This cabin is seldom equalled in ordinary sloops 6 to 8ft. longer and of 10 to 12ft. beam.

**MISTRAL.**—This sloop, Mr. W. W. Kenyon, is out on the hard at Wallin's, South Brooklyn, for a thorough overhaul in time for spring. She will stow lead ballast this season in place of the iron kentledge will have cockpit floor raised, fresh mahogany fittings, new rigging and cabin redecorated.

NEW SLOOP.—Lennox, Thirty-fourth street, South Brooklyn, is building a sloop for Mr. P. Delaney. Over all, 39ft.; keel, 39ft.; beam, 12ft. 6in.; depth, 4ft. 11in.; mast, 44ft.; boom, 36ft.; gaff, 18ft. bowsprit, outboard, 14ft.; topmast, 20ft.; cabin, 14ft. long with 5ft. 6in. headroom.

**NEW SCHOONER.**—The Lawleys are making progress with their new moderate beam schooner. Load line, 60ft.; on deck, 70ft. beam, 18ft.; draft, 8ft. Frames double of white oak, sided 4in. and molded 6½in. at heels and 3¼in. at heads. Plank of yellow pine 2in.

**NEW SLOOP.**—John Munn is busy with the frame of Mr. J. W. Cooper's new sloop. Length over all, 51ft.; on the line, 47ft.; beam 16½ft., and depth, 6ft., with 5ft. draft. These are much better proportions than were wont in the old premises at Gowanus.

**HALCYON**—Is receiving new suit of sails, by McManus, of Boston as it is intended to race her next season. Winsome is also receiving a fresh fit from the same makers, including square-headed topsail, now becoming fashionable in the East.

**MEDUSA.**—The frame of Mr. Dexter's new 30-ton cutter, building in Boston, will be double, sided 3in.; molded  $4\frac{3}{4}$  at heel and  $3\frac{1}{2}$  at head; plank of 13in. yellow pine; deck,  $2 \times 2\frac{1}{2}$ in. white pine, long lengths, blind-nailed.

HEART'S EASE.—Hon. R. B. Roosevelt, with Seth Green and others, have reached Jacksonville, Fla., in the nonpareil sharpie Heart's Ease, and intend continuing the cruise, studying the habits of Southern fish.

**BIG STEAM LAUNCH.**—The Rev. John L. Aspinwall is having a launch or river yacht built by Mumm at Bay Ridge. Length, 118ft. on water line, 168ft.; beam, 18½ft.; hold, 9¼ft.; draft, 6½ft.

NEW YORK, Y. C.—Annual meeting to-night, for election of officers, at club rooms, Madison avenue and Twenty-seventh street.

HOPE.—Mr. J. S. Hathaway's sloop Hope is hauled out at Hutchins & Pryor's, South Boston, to receive keel in place of board.

**ROMER SHOAL LIGHT.**—The Lighthouse Board will place an automatic gaslight on the Dry Romer in the lower bay.

LETTERS.—We have letters for Mr. John Harvey and C. G. Y King at this office.

### Answers to Correspondents.

No Notice Taken of Anonymous Correspondents.

F. S. G., Newton Centre, Mass.—You can address him at Hillsdale Mich.

JACK HANNISTER, Newburgh, N. Y.—See answer to another letter.

FLATHEAD, Missoula, Mon.—Address Mr. J. Mortimer, Morris street, New York.

A. P. H., Hyde park, Mass.—We know of no Irish setter of that name that has been conspicuous on the bench or in field trials.

R. D. P., Portland, Me.—The only advice we can give you is to refrain from performing such a cruel operation to the disfigurement of

J. P. S., Linwood, O.—Owners of Chesapeake Bay dogs should advertise their dogs if they have any for sale. Perhaps some one will do so on reading this answer.

MEDICUS, New York.—"Stonehenge on the Dog," "Book of the Dog," by Vero Shaw, and the "Management and Diseases of the Dog," by Woodroffe Hill, are all standard authorities.

G. W. C., Washington, D. C.—H. G. Dungan's Frank did not receive a mention at the New York show of 1879. He was entered in the open dog class and was described as 2½ years old, by Frank-Sis II.

P. V. S. P. Farnham, Mass.—As you acknowledge yourself that the photograph of Fan is "poor and does not do her half justice," it is not fair to ask us to give you an opinion of her "judging from the picture."

C. L. R. II., New York.—We doubt very much if you could get one of the old stamp. They were so much neglected during the war that the breed ran out, and is now much crossed with the foxhound.

C. E. C., Lyan, Mass.—Will you give me a full description of the Bethabara wood; that is I would like to know the color—whether white or dark—and if it is heavier than lancewood or not. Ans.—It is much like greenheart, if not the same. It is a dark wood, and

J. F. M., Brooklyn, N. Y.—1. It is not too old to try what she can do. Send her to a good breaker and get his opinion about her. 2. In the early spring as soon as the snow is cleared off and the grass

not likely to be killed off. Liberate them on the place you purpose they should breed and see that they are supplied with food. The rest must be left to nature.

E. W. B. Bucklin, Linn Co., Mo. - 1. I have broken a young Irish

setter this season. He is pretty good at everything except ranging. How can I teach him quartering and style? 2. What is distemper? Can you give me symptoms and cure? 3. Can you tell me of any good ground for snipe and wildfowl shooting within easy reach.

not over forty miles of either Kansas City or St. Joseph. Must be in the State of Kansas. Q. Is the enclosed hair the correct color for an Irish setter? Ans.—1. Read "Training vs. Breaking," 2. A fever. The first symptoms are nearly always catarrhal. Almost everyone has a definite blood-poison. We have a rich supply of the best of

was an absolute remedy. We have tried many of these, but find the most successful plan is to let them alone, at least so far as drugs are concerned, and give nature a chance to work a cure. 3. We are unacquainted with the grounds. 4. Yes.

# FOREST AND STREAM.

A WEEKLY JOURNAL OF THE ROD AND GUN.

TERMS, \$4 A YEAR. 10 Cts. A COPY.  
SIX MONTHS, \$2.

NEW YORK, FEBRUARY 8, 1883.

VOL. XX.—No. 2.  
Nos. 89 & 40 PARK ROW, NEW YORK.

## CORRESPONDENCE.

THE FOREST AND STREAM is the recognized medium of entertainment, instruction and information between American sportsmen. Communications upon the subjects to which its pages are devoted are respectfully invited. Anonymous communications will not be regarded. No name will be published except with writer's consent. The Editors are not responsible for the views of correspondents.

## SUBSCRIPTIONS.

May begin at any time. Subscription price, \$4 per year; \$2 for six months; to a club of three annual subscribers, three copies for \$10; five copies for \$46. Remit by registered letter, money-order, or draft, payable to the Forest and Stream Publishing Company. The paper may be obtained of newscasters throughout the United States and Canada. On sale by the American Exchange, 449 Strand, W. C. London, England. Subscription agents for Great Britain—Messrs. Sanson Low, Marston, Seale and Rivington, 188 Fleet street, London.

## ADVERTISEMENTS.

Only advertisements of an approved character inserted. Inside pages, nonpareil type, 25 cents per line. Special rates for three, six and twelve months. Reading notices \$1.00 per line. Eight words to the line, twelve lines to one inch. Advertisements should be sent in by the Saturday previous to issue in which they are to be inserted. Transient advertisements must invariably be accompanied by the money or they will not be inserted.

Address all communications,  
Forest and Stream Publishing Co.

ANSWERS TO CORRESPONDENTS.

## THE NEW YORK GAME LAW.

WE print elsewhere the views of several correspondents on the proposed amendments of the New York game law.

We agree with Mr. Zerega in thinking the provisions of the bill relating to the collection of specimens by naturalists somewhat oppressive to the ornithologist, but it will at least, if enforced, stop the present wholesale destruction of small birds. It will be a difficult matter to make such protection effective, and at the same time to cut the ground from under the feet of the man who makes merchandise of bird skins.

It was to have been expected that there would be a difference of opinion on the provision relating to the bounty on hawks. Our correspondent is quite right in stating that, "Nature if left to herself will absolutely balance all things;" but he must remember that, at the present day and in this country, nature is by no means left to herself. On the contrary, she is interfered with in every possible manner. The game birds have a host of enemies and but few friends. The rapacious birds, on the other hand, most of them die of old age. They are terribly destructive to the quail. In order that the balance of nature may be preserved, there should be meted out to them some of the measure that they give to the game. We do not underestimate the havoc which these *Hapacæ* cause among noxious rodents and insects, but that they cause a great amount of destruction to game, we know very well. Even the marsh hawk, which most people regard as no better than a mouse, we have known to catch quail, teal and meadow larks, besides other smaller birds. We have examined the stomachs of too many hawks and owls not to have a pretty clear idea of the food which they eat.

There are, of course, a number of species of *Falconidae* and *Strigidae*, which are of the greatest benefit to the farmer; but in framing a general law, it is hardly possible to deal with the individual species. The good must suffer with the bad.

We expected when we penned the paragraph relating to bay bird shooting, to which exception is taken by another correspondent, that it would by no means meet the views of

a considerable number of our readers. Still, we are obliged to hold to our original view, that a postponement of the open season to August 1 would result in better shooting—more shots and more birds—than if it opens July 1.

We do not regard the matter as an especially important one; the birds have bred, and may well be shot during the late summer and early autumn by those who enjoy the sport. There is usually a flight late in July, but it consists only of a few birds, chiefly dowitchers, with an occasional plover, which from the moment they sight Montauk Point, are banded at unceasingly. A few of them are killed, but the majority hurry on in the hope of finding some resting-place, where they will be free from constant molestation, until they reach the quiet shores and marshes of Virginia. If the shooting of these birds was postponed to August 1, a very different state of things would ensue. The birds would not hurry onward in the wild rush for safety that now takes place. They would loiter along the Long Island and Jersey coasts, feeding and fattening. Their presence on the beaches and marshes would call down others of their kind. This would continue for a week or two, and by August 1 there would be birds enough to afford good sport until the August flight came on. As it is at present, the appearance in July of a little flock of dowitchers is the signal for every man in the neighborhood to run for his gun, and the birds have hardly time to alight before they are being chased away again. The result of all this is very naturally the shooters in July get few or no large birds, and devote themselves to the tiny peeps, sandwings, ring plover, potato snipe and other little birds about as big as one's thumb which breed on Long Island, many of which in July are still occupied in raising their young.

From the facts presented by Mr. Collins it will be learned that the provision forbidding the transplanting of trout is designed to remedy a most flagrant abuse, and in view of these facts it is desirable that such a clause should be incorporated in the law.

The report of the meeting of the Game Law Committee at Albany in another column, gives the views of some sportsmen on the various points brought up in the Townsend bill. It will be observed that there is a tendency on the part of a great many gentlemen to ask for special provisions excepting the regions where they shoot and fish from the provisions of a general protective law. All special legislation of this kind is wrong, and tends to render inoperative a law otherwise good. If one county is to be excepted from the provisions of the act, its next door neighbor may ask the same privilege, and so for the whole State, county by county. We shall regret to see the bill materially changed except as to section 4.

The Chairman of the Assembly Committee on Game Laws, in his closing remarks on Tuesday, touched, as with a needle, the root of the greatest bar to successful game protection by law. He said that the Committee was anxious to give sportsmen the necessary protection, but they did not seem to be able to agree on what this was. Of course he did not put it quite so bluntly as we have, but that was about what it amounted to. Until the angling and shooting public come to be practically of one mind as to what is the best course to be pursued to preserve our game and fish, each step toward such protection can only be made after a hard fight.

Our laws at present are absurd in the number of exceptions, which they make to the general provisions of the act. Who can tell, for example, why it is, that "in the waters of the Walkill River, within the county of Ulster," it is "lawful for any person or persons of the same family or household to possess and fish for suckers and eels in the waters of said river during the months of March, April, October and November with a single fyke, the meshes of which shall not be less than one inch" when for the greater portion of the waters of the State, any such fishery at such times and with such a net is unlawful. Of course we all know well enough how such provisions come to be inserted.

The worshipful member from Ulster, whoever he may have been at the time when this law was passed, no doubt arose in the Assembly chamber or committee and stated that to forbid his constituents to catch suckers and eels was outrageous, and his legislative brothers who knew nothing about the subject and cared rather less agreed that an exception should be made in favor of the gentleman's constituents. And so it goes all through the bill. The members of the present committee on game laws, it must be said, gave the fullest and most courteous hearing to those who appeared before them on Tuesday, and showed that so far as they were concerned this important subject will have intelligent and careful attention.

## OUR RIFLE FUTURE.

THE summary, elsewhere published, of the report of the National Rifle Association of Great Britain, shows how much of a fixture in the general life of the Kingdom the practice before the targets has become. Notwithstanding apparent set-backs there has been for nearly a quarter of a century a steady growth of the interest in rifle shooting, and with that interest may be traced great improvement in the arms used.

There are many good observers who find reason to think that without rifle shooting and the rivalry which naturally springs out of its pursuit the Volunteer movement in Great Britain would have been a failure ere this. Instead of making the enrollment and the drilling of bodies of men the one great end and aim of the National Home Guard, the requirements of an efficient Volunteer embraced that of shooting fairly well. Here came in an element which set the men individually on a level, and while the metropolitan centers gave large commands admirably drilled and fit to make a brilliant showing on parade, it was the little squad of a company far off in some scrubby hamlet which, likely as not, carried off the shooting prizes, and so the honors were distributed about in such fashion as to keep the whole force a vigorous and healthy one. The city commands might have fine chances for parade over broad thoroughfares and with commodious drill-rooms, but the country guardsman with a range at his back door burned powder, kept a clear eye and a steady hand, and was very properly recognized as a very important factor in the make-up of the whole force.

The National Rifle Association came in as an important adjunct in this direction. While structurally independent of the Volunteer force it lived only for that force, and was controlled by it. It was not a bureau of the regular establishment, yet without it the force would have lost an essential part of its life, and it is doubtful whether either could have long survived the other. Shrewdly managed in a business way it has prospered through liberality. Seemingly at times over conservative, its record will show that there has been a steady encouragement of the best arms, and it is safe to assert that without Wimbledon the world-to-day would not have several of the rifles which are now recognized as the best. The rules of shooting have been changed and altered from time to time, and though always against a certain amount of protest, yet always for the betterment of rifle practice. There have been many reasons which have helped the managers of the National Rifle Association. They were enabled to draw a very large clientele from a very small area of territory. The run up to London is but a matter of a few hours from any part of the Kingdom. The time of holding the meeting is well selected. There is a widespread feeling of intense local patriotism or clanishness which institutes sharp distinctions of section, and upon this feeling it is easy to build up a rivalry such as been seen at Wimbledon from its first establishment. Then, too, special journals most admirably conducted, and generous notice and encouragement in the ordinary press channels, have helped the movement greatly, until we see it to-day rich and as firmly established as it is possible for such an agency to be.

On this side the water there have been at times expressions of surprise, that in ten years of existence, modern rifle shooting should be in such a backward state. The error which was the foundation of this surprise, is in supposing that the United States will ever in proportion to its population make such a showing as that annually seen at Wimbledon.

It will be noticed at once that many if not all of the conditions which have made the broad common on the outskirts of London such a popular resort are wanting in this country.

We have no such Volunteer force or National Guard as that which exists in Great Britain, simply because we do not need any such a cumbersome agency of defense. To preach the danger of a foreign attack is to be laughed at and with a few companies of reliable militia, ready to act on call as a sheriff's posse in suppressing any riotous demonstration, we have all the National Guard which is really necessary. The regular army is little more than this and both organizations deserve support, mainly because they serve as schools for officers, and in this fact there is a feeling of security for Americans and a quieting hint to would-be meddlers with us as a nation. We have little of that clanishness which is so marked abroad, and repeated attempts to push inter-State matches show the absence of that sentiment. In short, the conditions and environments of position and feeling, which go to make Wimbledon such a busy center during a certain period each year are entirely wanting on this side the ocean, and all steps in the encour-

agement of rifle shooting must be taken with that fact plainly in view.

This condition of affairs does not mean, however, that there is to be a dying out of rifle practice here. Just as a single regiment of our National Guard in the late war furnished officers for an army, so the handful of marksmen who practice intelligently and persistently before the butts keep alive a knowledge of the art, and when occasion requires it they form a nucleus around which there soon clusters an efficient corps of riflemen. The American works under impulse, and it is idle to expect a large body of men to undergo the drudgery of ball practice when there is no incentive in view. We have no organization with a richly-endowed prize-list which would encourage, if nothing more, at least a certain amount of pot-hunting marksmanship, neither can we secure the use of the ranges by vigorous orders to our National Guard. The members would not permit their labor of love to be turned into a toil under a task master. Quick to catch and improve upon an idea, with no prejudices born of established practice, the American marksman should fill the post of an expert observer.

Winthelton itself is an excellent place for study, and had more note been taken of what was going on there, the fiasco of our International Military Match of 1882 would not have taken place. We certainly should have known something of the sort of rifles the Englishmen were using for the style of work in which they challenged our competition. That the British pursue this plan of observation and adoption is manifest by their ready acceptance of the sensible American device of a wind gauge for military rifles.

There is no reason, then, why America may not and should not hold her own with the other nations in the matter of rifle making and shooting. She should hold her place at the front of the line, but this can only be done by an intelligent noting of what is going on the world over, and it may be carried on without those great gatherings of marksmen engaging in a whirl of competitions, and then rushing away to renew the struggle a year later. A score of ranges here and there over the States, by an interchange of continuous records, can do fully as much for the real advance of marksmanship as any central gathering, and then the need of a National Rifle Association will come in as a regulating body, to make rules, secure uniform conditions of practice, and point the way to the best endeavor in the line of new work.

#### FRIENDS OF THE PARK.

**A**MONG the public men who have come out in vigorous defense of the Yellowstone National Park against the audacious schemes of the prospective monopolists is Mr. John Schuyler Crosby, Governor of Montana, whose letter to Senator Vest was published in our issue of Jan. 11. In his message transmitted to the Territorial Legislature of Montana, Jan. 23, Gov. Crosby recommends that the Legislature take measures under the Federal Government to convert the Park into "an asylum for the great game of the Northwest." This, as we have all along contended, is the one and only sensible course to pursue, so far as the game is regarded, and it is exceedingly gratifying to find in the present Governor such a public-spirited appreciation of the true interests of Montana and of the nation.

The Senate and House of Representatives of the State of Illinois have transmitted to General P. H. Sheridan, an official copy of their joint resolutions, thanking him for his report on the Yellowstone Park to the War Department, in which report he called attention to the danger of leasing the Park to a private corporation. The resolutions further declare against allowing the Park to pass into control of the Improvement Company, to be used as a cattle ranch and for the extortion of money from visitors. The resolutions also thank Senator Vest, of Missouri, for his bill, now in Congress.

The issues involved in this Yellowstone Park matter have been clearly defined, and are now well understood. On one side is corporate greed; on the other are the present and future interests of the people. No man at Washington who has a vote to cast on Senator Vest's bill can escape putting himself upon record. Public interest has been aroused. The people will carefully watch the course pursued by their representatives in Congress.

**THE AMERICAN EAGLE.**—A bill has been introduced into the Connecticut Legislature providing a fine of \$25 with added imprisonment for the killing or snaring of "the bird known as and called the American eagle." This is good so far as it goes; but another law ought to be passed to imprison for life the perpetrators of the horrible caricature of the bird of freedom, which is stamped on the light weight coinage of the land. The average citizen of these United States never saw an eagle—unless captive or stuffed—and would not know one in the woods from a turkey buzzard.

**THE ADIRONDACK FORESTS.**—The bill to prohibit in future the sale of public lands in the Adirondacks went to the Governor last Monday; and it will without doubt receive his signature and become a law. This is one step in the right direction; it will put a stop to the extreme folly which has in the past characterized this State's course in relation to the momentous subject of maintaining a normal water supply for the Hudson River Valley. The present movement is all too tardy, but we hope that it is only the beginning of a wise future policy.

**JORDAN AND GILBERT.**—The names of Jordan and Gilbert are very familiar to those who have paid attention to the progress of ichthyology within the past ten years. In fact those who do not keep up with the labors of Dr. Gill, Goode and Bean, Jordan and Gilbert, are apt to be left behind in the modern classification of fishes. These men have partly unraveled the tangled skein left by the early workers in American fishes, and having better facilities than their predecessors, and the advantage of their labors, have been able to go over their work with more material at hand from the great stores of the National Museum, and confirm, correct and revise their work. The early workers like Holbrook, De Kay, Girard, and those who laid the foundation of American ichthyology, labored under the disadvantage of having only a limited collection of local fishes to work with, and the only wonder is that their work was as good as it is. These remarks have been called up by the receipt of the January number of the *Indiana Student*, a journal published by the students of the Indiana State University at Bloomington, which contains a list of all the scientific papers of Prof. David S. Jordan, arranged in the order of their publication. This list comprises sixty-seven papers, principally on ichthyology, and Prof. Gilbert is an associate writer of most of them. The papers have appeared in various monthly, weekly and other periodicals, many of them in *FOREST AND STREAM*, and the list will be of value to those who wish to look up what these writers have said on any subject.

**THE LONDON FISHERIES EXHIBITION.**—Those who intend exhibiting at London are reminded that goods will be received up to the 15th of this month. The Albatross will take over the American collection, which will be a large one, without duplicate of anything, except canned goods, etc. The exhibition opens in May and time will be required to set up the goods and prepare for the opening day. Among other things a life-sized group of colored men, in wax, will show how oysters are opened, preserved and canned. Models of white men will illustrate how salmon are gaffed, and how the eggs are stripped from them. Everything connected with the fisheries, from the clothing and implements of the men, their boats, houses, etc., to the methods of drying, salting, and curing fish with smoke, will be shown. The exhibit will be in charge of Prof. G. Brown Goode, who will be assisted by Mr. R. E. Earl, in charge of the fish-cultural department. Mr. Earl is prepared to make the best show of fishculture that has ever been seen and is well informed on all subjects connected with his department. The party may sail early in March in order to prepare the exhibit in time.

**A HALE FISCHULTURIST.**—In our fish-cultural columns will be found an article on carp culture, by Mr. Edward Stabler, whose "Reminiscences of an Octogenarian" we published in our issue of January 4. Mr. Stabler is now in his eighty-ninth year, and is still in active business life. He has been president of the Mutual Fire Insurance Company, of Montgomery Co., Md., for the past thirty-five years. He is also the oldest postmaster in the United States, his commission dating back to 1880, under President Jackson's administration, and he still discharges the duties of the office at Sandy Spring, this being the fifty-third consecutive year that he has held the office under the many changes of political supremacy. Mr. Stabler has taken to carpiculture with success, and we hope that he may live many years to enjoy his fish and his well-earned rest from the more severe labors of life.

**CARVER AND BOGARDUS.**—As may be learned by reference to our trap columns, Carver and Bogardus have agreed to shoot a match at Louisville, Ky., Feb. 22. While the exploits of professional shooters have in the main ceased to excite much public attention, this match will be regarded with interest. There are no other professional shots in the world to-day concerning whose relative merits such a difference of opinion exists. The results of this match, and of the others which presumably will follow, will not necessarily be accepted as determining which of the two is the better wing-shot, for the public understand very well that both Carver and Bogardus shoot to make money, and that they are smart enough to manage a hippodrome pigeon match in a way to do themselves the most good.

**A PROPHYLACTIC AGAINST HYDROPHOBIA.**—Mention has from time to time been made in this journal of the work of the French microphysiologist, M. Pasteur, who has been conducting a series of researches into the nature of the microscopic organism of hydrophobia. Procuring a quantity of the saliva of a victim of hydrophobia, M. Pasteur succeeded in cultivating the germ of the disease through numerous generations, finally obtaining a product which, having been introduced by inoculation, proved efficient to prevent the introduction of the germ of true hydrophobia into the system. He has thus, it is reported, demonstrated the possibility of vaccination for the prevention of hydrophobia.

**SCTERTISORS.**—An impression appears to prevail in certain parts of this State that the county supervisors have power to extend in their counties the open seasons on game and fish. No such authority is granted them by the law. They may only extend the close season.

**AN EDIFYING SPECTACLE.**—That of a number of professional men in Massachusetts, who dare not venture into the State of Maine for fear of being arrested and clapped into jail because they have violated the moose and deer law of that State.

#### FOREST AND STREAM FABLES.

**XII.—THE PUPPIES WHO DIDN'T KNOW IT WAS LOADED.**  
**A**n old Hound whose Home was hard by a Ledge where many Skunks lived, had often cautioned her Puppies against playing with the Old or the Young ones for fear of most unpleasant consequences. For a time the Puppies heeded her and kept aloof from the Skunks, but at last were tempted to disobey, and presently came Home half blind, howling with pain, and smelling so outrageously that no one with a Nose could endure their Neighborhood.

"My Children," said their Mother, "if you cannot see, you can feel and smell what your Disobedience has brought upon you."

"Ah, Mother," whimpered one, between his howls, "it was such a little Skunk, that we did not think it was Loaded."

"Naughty Children," cried she, "you should always treat all Skunks as if you knew they were Loaded." Whereupon she whipped them all soundly.

#### MORAL.

Puppies should not fool with Loaded Playthings.

#### WINTER TALKS ON SUMMER PASTIMES.

##### XII.—THE ADIRONDACK STATE PARK.

Majestic woods of every vigorous green.

Stage above stage, high waving o'er the hills,

Or to the far horizon wide diffused,

A boundless deep immensity of shade. —Thomson.

**I**T is now more than thirty years since I wrote my first article in favor of dedicating the entire Adirondack region to public use as a State Park. Since then I have availed myself of frequent opportunities to press the subject upon public attention, but when most needed, independent of any general response, I may have been moved primarily by my appreciation of its importance as a fish and game preserve and as a summer resort where all the people could find repose and healthful recreation. But the subject expanded under reflection and discussion, until it became easily demonstrable that what was suggested was not simply desirable as a preserve of sport and recreation, but as vital to the material and commercial interests of the State as well. The argument in brief was this: Forests are great natural reservoirs, holding for gradual distribution the rain-falls of the year, and thereby not only preventing sudden and destructive freshets, but furnishing steady supplies for adjacent streams during the summer months. No forest on the continent performs this office more profitably than that which crowns our northern border. Its waters, held back artificially until needed, feed the Erie Canal. Without this supply this great commercial artery would be practically useless during a portion of the season, and the gradual filtration of what is absorbed by the hundreds of square miles of spongy soil embraced within the forest limits gives to the Hudson River the supply required for the navigation of that river, and for the power of its waterfalls, and, therefore, of more recreative or sanitary consideration, the preservation of this vast forest region would be the highest wisdom, because indispensable to the permanent commercial supremacy of the State.

Since this subject was first agitated on this line of its material importance, many tens of thousands of acres have been stripped of their best timber, and large tracts have passed from the control of the State into the hands of individuals. Fully one-third of the territory has been transferred within the period named, and whatever beneficial results may be hereafter secured by State guardianship and supervision will be curtailed to this extent. But it is not yet too late for the Legislature to render effective service; and I am glad to know that that body has at last recognized the importance of the question which has been so long treated with stupid indifference and criminal neglect.

Statesmen and statisticians can only look at this subject in its material aspects, and these are of sufficient importance to challenge their best thought and most immediate attention. But it is of interest to all who find pleasure in seasonable out-door life as well, and all such will rejoice as they realize the danger to the preservation of this vast forest from ultimate denudation as those who may be in such action the uninterrupted efficiency of the Erie Canal and the Hudson River as the great arteries of our inland commerce.

The present probability is that before this article finds its way into print, the needed statutory provision will have been made to secure the dedication, forever, of this vast forest as a State Park. And no single act of the present Legislature will be longer or more gratefully remembered, its value as a game preserve and as a summer resort for the whole people will grow into fuller appreciation with every passing year, and future generations will rise up to "call those blessed" who had the thoughtful sagacity to thus contribute to the sanitary, recreative and material needs of the State.

In this tardily consummated measure a gratifying illustration of the potency of public sentiment and the salutary influence of the public press. It is not many years since the proposition to preserve this immense field of forest, mountains, valleys, rivers and lakes was scouted as an absurdity which only æsthetic visionaries would suggest, and none but reckless marauders upon the public treasury approve. This idea has gradually given way before the overwhelming arguments in favor of the project, and now it is not only accepted with enthusiasm, but the stolid stupidity of the past is the subject of universal regret and denunciation.

The final outcome of this long-mooted subject should encourage you in your persistent and patriotic war upon the conscienceless speculators who are seeking to acquire possession of Yellowstone Park for their own benefit and to the imminent peril of the generation which precedes them. But if these men seek is conceded, a great wrong will be done to the people, and a policy inaugurated which will result in the practical destruction of that vast province, if not in its ultimate alienation from the custody and supervision of the Government altogether. But I am hopeful that no such calamity is to fall upon the generations of the future. The present generation of public men may not be more virtuous than that of the generation which preceded them, but if some things they are wiser, and in nothing more conspicuously than in the growing idea that statesmanship embraces

a broader field than the mere material, dollar-and-cent interests of the people.

The characteristics of a nation are illustrated by the characteristics of its individual subjects. Whatever happens and exalts the individual, happens and exalts the nation, and vice versa. The individual repose contribute to the physical enjoyment and beautiful development of the people. That nation best performs its functions which makes most ample provision for what is so essential to individual vigor and vitality. The Yellowstone Park, if preserved in its full integrity, is destined to become the great pleasure resort of the continent, and the present is the time (sooner would have been better) to inaugurate a policy for its preservation, and to prevent the reckless vandalism and the grasping avarice of insatiable greed.

Although large tracts of timber have been cut in the Adirondack region during recent years, the entire territory still retains its wilderness character. The forests have been simply culled, not destroyed, except at a few points where hostilities have been placed for the accommodation of tourists. The mountains are still densely covered with forest foliage. The lakes retain their primitive beauty and still retain their swiftness through their original channels with their old-time velocity. The water in both lakes and rivers still remains unpolluted by foreign substances, and is as transparent and of the same grateful temperature to-day as when the stars sang together on the morning of creation. At one or two points, to be sure, dams have been erected which, by the back-water they have occasioned, have marred the beauty of many miles of river border. This is noticeably true of the Raquette river from Setting Pole Rapids (where the dam was built) upward very nearly to the falls. Before this obstruction interfered with the natural flow of the water, the river, for most of the distance, was fringed with beautiful hemlocks, spruce and soft maple, which were killed by the back-flow caused by the dam. The same cause also spoiled a great many old trout haunts by changing or entirely obliterating the current of the stream. But notwithstanding this, the Raquette is still a beautiful river through its entire length, and the whole region has still enough of its original characteristics to make it worthy of preservation and of the perpetual guardianship of the State.

A large number of small tracts of land have been sold to those who have learned to appreciate the advantages of the region as a summer resort. These will be enhanced in value by the State, but as most of them will be improved and beautified by the owners, and the whole is different with tracts purchased for timber purposes alone. If possible, they should be recovered by the State—as they may be at moderate cost—that the process of denudation may be carried no further. If this shall be done (as is proposed), the State of New York will be an Empire among the States, because of the extent and magnificence of its Park, as well as because of the vastness of its commerce and the boundlessness of its wealth. G. D.

## The Sportsman Tourist.

### NIMROD IN THE NORTH.

BY LIEUT. FRED SCHWATKA, U. S. ARMY.

#### III.—The Rifle and the Reindeer—Concluded.

ON the 7th of May our party killed ten reindeer out of a herd of fourteen. The scene was an exceedingly short one. The herd being described about a mile distant lying down on the side of a hill, all the Inuit hunters and dog sleds started in pursuit of the sledges and dogs remained on the spot. For about half an hour the hunters were shielded from sight by the hills, but nearly all the rest of the distance was consummated by crawling, Indian file, in full sight of the animals, until a near hill for a minute or two allowed them to get within about a hundred yards, when a volley of rifle shots greeted the astonished herd, and almost only one was wounded at the first fire, before the bewildered herd could determine a safe direction to pursue, ten of their number were wounded or dead, all of which were secured, for it is seldom that a reindeer wounded at all severely is lost by a good hunter. Two of the remaining four were secured by Tooloah the next morning when returning to look up their missing comrades.

We were now in a country never trod before by white men, and by persons armed with their weapons, so it was evidently a new and untried hunt. The hunters were of the locality, and they acted with a stupor of the mind revealing these facts. Where the reindeer is hunted considerably with firearms he becomes shy enough to give one excellent sport in his capture. Like the antelope he will circle around until he catches "the wind" before he is off, and this peculiarity, with a few magazine guns in full blast, thus hunt rapidly. They also have something of the curiosity of the antelope, but in this respect they are different. Like all animals that have developed to such an extent, security resulting from numbers makes them much slower to pick out their line of retreat. In this manner they closely resemble the stupidity of the American elk, and like them, when often hunted and in small bands, they are game worthy of any man's powder.

On the next day, the 8th, we encountered a fresh musk-ox trail and a reindeer, killing seven; we also came upon old signs or markings done by salmon people and by natives of this country. On the 13th, the bad weather being such that we remained over, I noticed that the many reindeer signs kept Tooloah nervous, until he had sallied out in the tempestuous elements, and after an absence of a couple of hours, he returned to get the dogs and sledges to bring in the carcasses of seven reindeer that he had killed out of a herd of eight, with eight shots from his Winchester carbine. Returning with these two others were secured.

On the 14th, we passed a herd of about two hundred reindeer, but our sledges being so loaded with meat, we allowed them to trot by within easy rifle range, unscathed and astonished beyond measure at this wonderful innovation. They were singularly tame and often running toward us a few paces, would halt like a company of cavalry coming from late in the rear, gaze at us with dilated eyes and distended nostrils, until a snort from some suspicious creature would send them off by the flank with meek and respectful well drilled troopers. It seemed like a grateful chance to exercise our humanity once more by not taking advantage of their confidence, and we willingly declared an armistice until our heavily laden sledges should become somewhat lighter.

Signs of natives daily grew fresher, and on the 15th of

May we came upon a band of some thirty souls, only two of whom, a couple of old men, had ever before seen any white men. We consequently attracted an unusual share of their curiosity, and their staring eyes riveted intently upon us, followed every motion that we made. If the old men moved, the children followed, and their guns, as we showed them their use, was truly appalling. We had expected to meet natives upon or near the mouth of Back's Great Fish River where it empties into the Arctic Ocean, and had depended, to a certain extent, upon procuring from them dog food and oil, but now we found the tables turned. Instead of being beggars, we were philanthropists, and instead of being receivers, we were obliged to give, for we found our Esquimaux friends in a state of semi-starvation. Their food in the summer and early winter is furnished by the numberless shoals of salmon that then ascend the creeks and smaller rivers, and are speared as they run the gauntlet of the rapids. The flesh of the musk-ox, which they hunt with dogs and bows and arrows or spears, gives them a precarious subsistence during the remainder of the year. They kill barely enough reindeer in the summer to supply them with clothing, the noise of walking or crawling on the crisp snow, and the action of their guns, making it impossible to get sufficiently near to secure the game with bows and arrows. The twang of the bowstring traveling more rapidly than the arrow, the active deer has no difficulty in jumping out of the way at any distance beyond twenty-five or thirty yards. But in the summer time the wary native sometimes succeeds in crawling within these limits, or lying in wait on certain paths followed by the game, will obtain one.

Another plan much followed by those natives throughout the Arctic not without success is to establish a line of stone monuments at about fifty to a hundred yards interval along the crest of some prominent ridge, often two and three miles in length, which runs obliquely toward and terminates in the water's edge of some large lake or wide river. A sharp lookout is kept from some available point, and if a herd of reindeer is found feeding or walking within the crevice and formed by the shore line and ridge, bristling with stone cairns, the natives engaged in the chase deploy into a skirmish line sufficiently long to close the mouth of this angle and walk slowly toward the reindeer, their bows and arrows or spears and their kinks (light skin canoes) being carried along or concealed in some convenient place near the water's edge. The herd, seeing the slow approach of their enemies, trot leisurely away until they come within gunshot of the rock monuments, which have been made to imitate the human form as far as possible, when, believing themselves to be surrounded on the land side, they take to the water as the only means of escape left them. No sooner is the herd fairly in, than the agile natives are in hot pursuit, with their kinks flying through the water, and rapidly overtaking the bewildered animals, they dispatch them with arrows and spears, and haul their carcasses on shore to be butchered.

This sport is without its dangers, as oftentimes a wounded animal or a belittled buck seeing flight impossible, with swinging horns and plunging horns, turns so swiftly on its pursuer that he succeeds in tearing the fragile kink to pieces, and the wrecked Esquimaux, unable to swim, drowns if he is not promptly rescued by some near neighbor, or manages to float on the wreck of his boat until help arrives. It is a singular fact that a herd of reindeer, so the natives say, will repeatedly graze upon the same place, and remain until on any further notice, than a few suspicious glances at them as they pass by, but the minute moving figures force them against these stationary ones their suspicion is raised to a pitch high enough to make them prefer the water rather than to trust them. Yet this is not very hard to comprehend if one knows the almost half amphibious nature of the Arctic deer. I have seen them when taking up a line of march, wading and swimming right through a creek, and posed itself in their direct course rather than to go around it, although this would not have exacted a marked detour, which fact, I imagined, must have been as patent to the deer as it was to myself. And the Esquimaux tell me of even bolder deeds. When pursued and "cornered" on some of the long narrow tongues of land projecting into Hudson's Bay, they have known the deer to take to the sea and swim directly overboard, and when they were in vision, and whether they were thereby drowned or not they could not tell. The Arctic deer seems to be almost as much more amphibious than his Southern fellow as is the polar bear than his Southern brethren.

We crossed over to King William's Land on June 11, and the greatest consolation in our first few days' journey was the great number of reindeer we here encountered, and which rapidly grew to be a matter of course. It was not long, had led us to believe would not be, that we came to the interesting note that on June 20, 1879, the civilized provisions of the party were exhausted, previous to which time they had been greatly reduced in the reindeer country, and from that date until March 20, 1880, we lived solely upon the same diet as our native allies, and as we have already said, principally upon reindeer.

On July 20, while we were in the southern part of Erebus Bay, we found a herd completely out of meat, an occurrence which had seldom happened, owing to Tooloah's activity and good hunting. I now felt that we surely had a fast ahead of us, for the fog was one of the very thickest I had ever seen in my life, but despite all this, Tooloah secured three reindeer after being absent about four hours. The Inuits, when hunting reindeer during thick, heavy weather, generally go in pairs, accompanied by a good, trained dog, and the hunter and his dog keep well to the side of the quarter suspected of containing game. The dog's nose soon tells them if their conjectures are right, and they follow him, his nose high in the wind on his aerial trail, until his frantic tuggings at the harness line by which he is held (for the well-trained Esquimaux dog never barks in the presence of game) show them to be near by, when one of the party holds the dog and the other with his weapon crawls cautiously forward on his unseen victims. If the fog is very thick the deer can often get within a few yards by hugging the ground closely while crawling. During the time the snow is on the ground they may take several dogs, and after being successful in the chase, utilize them to drag in the carcasses. This is only done, however, when the skins have become useless; then the butchered deer is put into the hide and it is used as a sled. The men then claim that it is not difficult to kill a reindeer much further in the fog, if it is a drifting deer, than in any other circumstance. It is not unreasonable to infer that the scent will not be so diffused in such a dense medium as an Arctic fog, and therefore be more concentrated at greater distances, yet I have heard good hunters in our regions

claim that fog completely kills a scent. A well-trained Esquimaux dog, with good, keen scent, will often detect the presence of game at a couple of miles distance. The greatest trouble is to keep the dog off from every rabbit or rabbit trail which he scents or encounters, and which he seems unable to prove to follow than that of the game which is desired.

On August 8, while encamped in Terror Bay, and prosecuting our search for evidences of Sir John Franklin's party, I killed a big buck under circumstances probably worth relating. While sitting down, resting from a fatiguing continuous walk of five or six miles over the boggy ground near the seashore, I noticed the reindeer grazing rapidly toward me, being then about six hundred yards off. I immediately slipped away to a barometer stand behind the boulder on which I had been resting and converted myself into an immovable Micawber. The reindeer came eating along, and when about two hundred yards away evidently struck a patch of clover, figuratively speaking, for during the next half hour he never left a little spot, where he kept grazing backward and forward until my patience was exhausted. His skin was the exact color of the duck-egg green against which he was eating, and waiting until he was "cut on," so that his white flanks outlined his figure, I took aim at his head as he was grazing, fired, and hit him in the hind foot. The shock brought him down on his hams, and I thought I had made an effectual shot until I got within about thirty yards, when he first perceived me, and, with one wild snort and a sort of revenue-reform gait, that defied the best aim, he started for the sea-coast, about a mile away, your humble servant bringing up the rear as fast as possible. I ran him out skin to a long point of land and there surely that I had him. On its west side the pack-ice had been carried by the wind and was probably forty or fifty yards wide, being held somewhat open by the outgoing tide. Seeing himself out off from the land side, and my rapid approach, he struggled and plunged against the cakes of pack-ice with his broken foot swinging in the air, until he reached its boundary, when he took to the water. His progress over the disjointed pack was painfully slow, and by the time he had plunged into the water I was within the nearest him, and from there sent a bullet through his brain that hid him out forever.

Now, I was in a quandary! He was beyond my reach from the furthest outlying cake of ice, and the tide setting out was not improving matters. Meat was not plentiful in camp, and further, a large supply was needed, as Tooloah was soon to leave us for a two-weeks' absence on a trip that I could not hinder him, besides the fact that the cold, dry plash as the ripples of salt water broke over it. In short, I didn't want to lose that deer, and there was only one method of getting at him, and I started about that at once. Stripping myself to my underclothing, I started to wade out through the tortuous "leads" between the ice-cakes, as I deemed this method less liable to produce cramps than jumping in from the furthest cake; besides I did not know a possible, although it only seemed to me about five feet. Reader, science will tell you that ocean water will be about two degrees colder than fresh water when both are holding ice in solution, or two degrees colder than the ice-water of your water coolers and other water receptacles; in short, ice sea water is two degrees colder than freezing. The first few steps made me gasp for breath and by the time I was up to my middle, my teeth had settled down to a regular drum-like rattle. I persevered, however, keeping my hands upon the nearest ice-shelf, and when I was within about five feet of the deer, I prize and my breast commenced sinking in the cold fluid. I thought that I had swallowed the North Pole. When I reached one of the deer's horns I was up to my armpits. The whole transaction was done and I had my deer on land in less time than it has taken the reader to peruse it, and this reached, I wrung out my dripping underclothing, the air feeling as warm as a southern breeze, and then giving myself a good shaking over my head, I put on all my clothes, worked like a pirate butchering the deer, slung his fifty pound hams over my shoulders, walked two miles into camp, took a quart of hot reindeer soup that was awaiting me, turned into bed and dreamed that I owned a hundred thousand reindeer worth a thousand dollars apiece.

The reindeer of King William's Land, on their northward migrations, cross over Simpson's Straits from the south side of the island in June or a month before the ice breaks up. About the middle of September, the weather is cold, the wind drives them south, and they congregate in its southern part before the straits have frozen over, and often wait a week or ten days for that occasion before they cross. I have said that the reindeer will swim anything as a lake or river that comes in his way, and the fact that he here seems to wait for the solid ice to form before crossing would appear to contradict this, but it is not so. When the first cold snap comes and the deer begin to go south, they are not in the solid water a kind of "mush ice," "slush ice," or "break," as it is variously called, which is not unlike a foot or two of loose snow thrown into ice water, where it will not melt, and is sufficiently tenacious to even impede the headway of a sailing ship. This hugs the shores and islands and drifts around in the currents, winds and tides like a hilliputian ice-pack. Should a reindeer trust himself to swim through this he would be so impeded and harassed that he could find an easy prey to the Esquimaux who congregate hereabout at this time, and this fact the reindeer know by some sort of instinct.

To this part of the island we also came in order to lay in a supply of meat, clothing and bedding for our mid-winter return trip to Hudson's Bay and civilization. Our camp was pitched near a high hill, on whose top a lookout was constructed to watch for the animals. On the 24th of September a cold snap nearly completed the freezing over of Simpson's Strait, and the next day we moved camp about a mile near a large fresh-water lake and there built an igloo of ice, being one month and five days earlier than the commencement of our igloo life in north Hudson's Bay. The hill as a lookout for reindeer was no longer needed, as these animals were becoming so numerous, as the cold weather set in, and upon us, that any desired number could be seen from any station whatever. The valleys almost as well as the top of the hills. On the last day of the month I felt quite sure that at least a thousand reindeer passed within as many yards of our little house of ice, and the first and second days of the next month—October—the number was certainly no less. On the 3d the ice was just thick enough to bear them on the Strait, and the first herd was seen on that day, and by the 7th the vast swarms had departed southward, leaving the very few that were left to bear us company. The 30th, the total score showed twenty-six killed, Tooloah scoring twelve, a number to which he limited himself only from the fact that it was the maxi-

gone below, where he remained until eight o'clock, when there being a half fathom of water on the bar, we sailed into the river.

On the little bay just inside of the inlet is an old palmetto shanty and a well, constructed by old man Futch several years before, where I then found him, nearly starved, waiting for his companion, "Sailor Jack," who had gone to Lake Waukegan for provisions, but who never went back, having shipped on a boat at Lake Worth for Halifax River, leaving the old man to shift for himself. I found this Sailor Jack a few days afterward at Lake Worth just as he was about to sail for the Halifax, when I took the opportunity to preach him a "sermon" on "man's inhumanity to man," which seemed to be thoroughly appreciated by the small but attentive audience.

While out hunting the day after our arrival at Hillsboro', in the beach scrub, an unusual object caught my eye as I was passing an open space between two bushes, which I saw at a second glance was a large rattlesnake coiled up within two feet of me. As I stepped back and withdrew a buck-shot cartridge and inserted one of small shot, he began crawling languidly and slowly away and without shaking a rattle, when I shot his head off. He was six feet in length, and had a very beautifully marked skin which I took off at once, giving the body to Skipper, who had often horrified the boys by telling them of his great fondness for fried rattlesnake. But although this was a fine specimen, four inches in diameter, with luscious and tempting-looking steaks along the backbone, all portehouse and tenderloin, he seemed to have suddenly lost all desire and appreciation for that kind of meat; at all events, he "didn't seem to hanker after it."

As we returned, we passed a shallow, muddy bayou, the bottom of which was left dry by the ebb tide, where we saw some oysters, and struck it rich. These oysters were the fattest, largest, and had the finest flavor of any I have ever tasted, and this is saying a good deal for one born and bred in Baltimore. They were all single oysters, none less than six inches long, and were attached to the denuded stems and branches of sea-fans (*Gorgonia*), and were thereby easily carried in bunches. Our dinner that day was a royal one: salt water chicken, baked steak, Spanish mackerel, broiled; venison steak; baked yams; boiled rice; sliced raw tomatoes, and for dessert bananas and green coconuts. A full-grown green coconut is a delectable, delicious and ambrosial delicacy calculated to delight and tickle the palate of the most satiated and *blase* epicure. Taking off the husk, one of the "eyes" is opened, the milk poured out into a cup, and the shell cracked in halves, when the meat will be found still attached to the husk; the milk is then poured back and the contents eaten with a spoon.

After waiting a day or two in vain for a fair wind, we left Hillsboro' River with a strong southeast wind and a heavy chop sea, and sailed close-hauled, making long legs and short ones down the coast, bound for New River Inlet, twenty miles below. After a few miles Jack was compelled to go below and Skipper was anxious to put back, but after two days' waiting for a fair wind, we were forced to make in a heavy sea. She worked to a charm, and after an exceedingly rough passage, the sea running very high, and in the teeth of a full gale, we made New River Inlet, where, though the tide was ebbing, there was plenty of water on the bar, and we at once made the run in, with Skipper at the masthead to look out the channel. A large brig beating down the coast ahead of us and laboring hard in the heavy surf, was the first sight that met the eyes, and it really seemed though it was, forsooth, lumpy and dusty enough, and proved to be the roughest bit of sailing we encountered on the voyage. The wind had been squally for several days, hauling from northeast to southeast, consequently, old Atlantic was on a high and tried his best to carry our bowsprit away, but it was a stout stick and stood the racket bravely.

We anchored in the river a hundred yards above the north point of the inlet, where there was plenty of water and good holding ground for the mud hook. New River, for six miles above its mouth, is the straightest, deepest and finest river I have seen in Florida, although a narrow one. It is famous for its sharks, regular man-eaters, some of them, and for the immense numbers and variety of its fishes. The boys drove down a snubbing post at the point of the inlet, where they hauled three sharks until their arms ached. It was an old man, with a beard, the almost complacency and even with hearty satisfaction, helping them to haul out some of the larger ones, for I remembered how nearly I came to being devoured by the monsters, at that very place, three years before. On that occasion Wash Jenkins, who has charge of the Life Saving Station (No. 4), eight miles above, had sailed us down the river to the south shore of the inlet, where we were to land our tramp to Biscayne Bay. It was then that on our return the ground and Jenkins failed to the scrub at the inlet, so that he, seeing the smoke, could sail down for us. We were gone a few days longer than we expected, and arrived at the inlet again one day about noon. We saw an old yawl-boat across the inlet, tied to some mangroves, and which belonged to old man Futch, but so far as we were concerned it might as well have been in the clouds. We set fire to the scrub, but a strong wind from the north kept the smoke near the ground and Jenkins failed to see it. We slept on the beach that night, and the next morning I told my party that if they would help to build a raft, I would cross over and get the boat, when we could walk up the sea beach to the station. We found a few water-soaked logs and tied them together with vines, constructing a rude raft about seven by three feet, but which, of its own weight, settled down in the water. I found a flat stick like a garden plank, some five feet long, and one inch thick, and three inches wide, a good deal as a paddle. I mounted the raft, which sunk to the bottom in the shallow water, but by floating it into deeper water I managed by great care to preserve my balance, standing upright, and found that it would sustain me, though it sank beneath the surface some six inches, with my weight.

Low water slack I started, but I found it difficult navigation, and my men divided the oars, and I used a double team and to prevent the frail structure from turning turtle and spilling me overboard; a single plank would have been a ship in comparison. But by dint of hard and careful, but extremely slow work, I reached the middle of the stream. The tide then began to make, and with it came hundreds of sharks, string-rays, sawfish and porpoises. I had not thought of them before. Huge man-eaters swarmed around me, and some divided oars, and I found it difficult to keep my head above water. The surface is dotted and diversified by thousands of islets and islands, of all shapes and sizes, from a few yards to many acres in extent, clothed with a tropical luxuriance of trees, shrubs and vines. The

touch of a shark's tail would have capsized my craft and sent me floundering into the water, where I would soon have been divided, piece meal, and distributed into the maws of a dozen sharks. But I struck at them with the slings paddle whenever they came too close, and thus kept them at a respectful distance. While using the stick in this way, I cracked at the middle, then it required double caution in paddling and striking. Finally, after a half hour's hard work I succeeded in getting across safely, where I bailed out the boat, in which was an oar, and sculled over after the boys. Under such trying circumstances there is nothing like self-possession, level-headedness and presence of mind, unless it be, as Pat said, absence of body.

Rushing in and out with the tide, at New River, fishes of all kinds are swimming, and can be seen by thousands, and the keen eyes of the boys, when a bit of white rag tied to the hook and thrown to them by a strong hand line. We took crevils from ten to thirty pounds, always larger ones here, never less than ten pounds. By anchoring a boat in mid-stream they can be speared or grained as they swim rapidly by, often pursued by sharks and porpoises. Mr. Jenkins takes them in this way up to forty pounds and cures and smokes them. The largest alligator we killed was here. He had crawled out on the shore where the boys had left some benches, when Jack shot him from the schooner with a mid-range Peabody-Martini rifle at a hundred and fifty yards, knocking the cap of his skull off; he was twelve feet in length. Alligators seem to be as much at home in salt water as in fresh.

Six miles above the inlet is the "haulover," opposite the site of old Fort Lauderdale, and marked by a group of cocoanut trees. From here the river runs southerly, to its mouth, and parallel with the shore, the intervening strip of ridge being nowhere much over a hundred feet in width. At the haulover the river spreads out into a broad, shallow bay, into which empty its North and South branches and several creeks, and is diversified by several islands. Two miles above the haulover, on the east bank, is the wharf or landing of Life Saving Station No. 4, the latter a quarter of a mile away on the sea beach. We made fast to the wharf and went to the station to see my old friend, Wash Jenkins, the keeper of the station. We found him alone, his family being away on a visit to Key West. He was very glad to see us, not having seen a human face since his family left three weeks before. His nearest neighbors are at Biscayne Bay, twenty miles below, and Steve Andrews at Station No. 3, twenty-four miles above.

We spent two or three days here shooting ducks, coots and snipe, and one day went out with Jenkins and his dogs for deer. Wash went out with me above on a neck of land between the North Branch and a creek to drive the rest of us taking stands across the timbered strip. I was sitting at the edge of some spruce pines, near an open space covered by galberry and myrtle bushes, when I heard some quail near by. I began to whistle and call them up, and soon had them all around me. There were, perhaps, thirty of them; they had never seen a human being before. I kept perfectly still, but continued whistling and calling, and had them hoping over my head, cooking up their cunning little heads and looking knowingly at me with their bright round eyes, as they ran about picking at the buds and leaves and bits of grass, twittering and chirping like so many young chickens. They soon wandered off and I was alone again.

That night we planned an expedition up the South Branch to the Everglades, to visit an Indian village, some twenty miles distant. Accordingly, next morning we moved the lumber schooner up the river, taking with us a few men and a boat. Taking our guns, a rod or two, some trolling tackle, and grub enough for several days, we embarked in an Indian cypress canoe, belonging to Jenkins, some twenty feet in length, and two feet beam, with sprit-sail, poles and paddles. We started at nine o'clock, sailing across the bay to the South Branch, which, being very crooked, we furled the sail and each man took a paddle. This branch of New River is much like the other, but the South Branch is about an average width of fifty yards, with perpendicular banks, green to the water's edge with a profusion of wild grasses and shrubs, and with a varying depth of from three to twenty feet. Many alligators were sunning themselves on the sand spits at the lower end of the stream. As we progressed the water became deeper and the current stronger. The banks were clothed, usually with pines, with an occasional clump of palmetto, water oak, swamp maple, bay, Spanish ash and other timber. Here and there were little coves or bights thickly grown with rushes, and aquatic plants bearing bright-colored flowers.

We soon reached the great cypress belt, through which the amber-colored stream poured silently and swiftly, though so clear that great masses of white, coralline rocks, seemed, fissured and lying in endless confusion, could be plainly seen at the bottom. The growth of cypress here was growing the most beautiful and curious aquatic plants and grasses. The tall cypresses, with pale and grizzled trunks, stood in serried ranks like grim spectres, ornamented in a fantastic fashion with the scarlet plumes of air-plants, while their long arms meeting overhead were draped in heavy folds and festoons of gray Spanish moss. The solemn and impressive stillness was broken only by the low cry of some startled heron or osprey, which echoed through the weird forest with a peculiarly hollow emphasis, and at last died away in a low mournful cadence. Our own voices sounded unnatural and strangely sonorous, resounding as though beneath the dome of some vast cathedral.

Passing through the cypress belt we came to the "sloughs" where the stream divided into several smaller ones. The "sloughs" is a margin of tall grasses and shrubs of very luxuriant growth, through which the water flows rapidly, and lying between the cypresses and the Everglades proper. Getting through this we finally emerged into the Everglades seemingly a sea of waving green grasses, with innumerable islands of all sizes. But these grasses are all growing in water, clear and limpid, with channels a few feet wide, diverging and crossing in every direction, through which a canoe can be sailed or poled; there was then two feet of water in the Everglades, and it is a fact that we unfurled the sail and went skimming along, greatly to our satisfaction and relief, for we were quite tired after paddling up stream some six hours.

It is a hard matter to convey a correct, or even an approximate idea of the region called the "Everglades"; it is unique, there is nothing like it anywhere else. As far as the eye can reach stretches a broad, level expanse, clothed in verdure with a peculiarly rich and intense green, and in the distance a color seen nowhere but here. The surface is dotted and diversified by thousands of islets and islands, of all shapes and sizes, from a few yards to many acres in extent, clothed with a tropical luxuriance of trees, shrubs and vines. The

mangrove here gives place to the coco-palm, which grows in endless profusion amid the swamp maple, sweet bay, mastich, water poplar, gum, limbo, satin wood, water oak, and towering above these, clearly revealed against the blue sky, the plume-like palmetto, which grows over and around all, running riot in their exuberance, are innumerable vines and creepers bearing flowers of gorgeous dyes.

Seeing a smoke several miles away, we sailed in that direction through the intricate and narrow channels, often making short cuts by plying through masses of lily-pads, deer tongue and lotus. As we neared the smoke we saw several canoes shoot out from behind islands on our right and left, their white sails gleaming and darting along in the mists of the setting sun like sea-eagles, and all proceeding in the same direction, toward the smoke. Suddenly, one we had not seen came swooping down upon us like a huge bird of prey from the shelter of a small island, a tall young Indian, clad only in a light-colored shirt, a red belt and an enormous red turban, stood upon the pointed stern guiding the canoe with a pole, while an elderly Indian sat amidships holding the sheet of the sail. They sailed through a converging channel into our course and waited until we were abreast of them.

"How 'd'ye?" said I.  
"How!" answered the old man. "Me see 'um canoe; me see 'um white man; me wait; me glad see 'um. How!"  
"We come to see you; we have a good time; come to see your village," said I.  
"We got big canoe—schooner—at station—at Jenkins's."

"In-cah! (yes, or all right). Me glad see 'um; in-cah!" replied he.

Here Jack put in his oar, saying: "We like Ingun; big Ingun; Jack. Lo! Come see 'um; big Ingun, whoopee! squaw, hoop-la! papoose, hi-yah! wigwan! wampum! you bet! wa-hoo!"

I saw from the twinkle of the old man's eye that he understood English very well, as he replied, good-naturally: "Hut! Young man—talk here—talk much—ho-ha-vaugus!" (bad, or no good). Then he continued: "Me Tiger; Big Tiger—old Tiger—old man—father—the chief; little chief!"

Then, pointing toward the pines on the mainland, he said: "Me go—village—you come—in-cah!"

The hauling aft the sheet, they shot away, our own heavily-laden canoe seeming to stand still in comparison. Those Indians had been at work in their fields on the islands, but seeing us coming, they quit work earlier than usual so as to get to the village before our arrival.

## Natural History.

### THE BIRDS OF MAINE.

With Annotations of their Comparative Abundance.

Dates of Migration, Breeding Habits, etc.

BY EVERETT SMITH

FAMILY FALCONIDE: THE FALCONS.—CONCLUDED.

153. Marsh Hawk—*Circus cyaneus* Aud.; *Circus hudsonius* Ridg. 430; *Circus cyaneus hudsonius* C. 489.—Abundant. Arrives in April. Breeds on the ground; lays from four to six dull bluish white eggs, generally faintly blotched with purple. The male incubates the eggs in May. The hawk is common throughout the inhabited portions of the State. The light gray plumage and the comparatively smaller size of the male bird misleads some persons into the belief that it is a different species of hawk from the larger female with its rich cinnamon brown coloration of plumage. But the large white space over the base of the tail, common to both sexes, may easily be seen as the bird pursues its low flight over the fields and meadows, and is a characteristic marking of the female. The marsh hawks do not frequent the forests, but make their haunts about the fields, marshes, and open lands, where they may be seen quartering their chosen ground as systematically as trained hunting dogs. They are very destructive to small game birds, such as are found in the fields and marshes, and they also prey upon mice, frogs, snakes, etc. This hawk does not commonly pursue its prey but pounces upon it unawares.

154. Cooper's Hawk—*Astur cooperi* Aud.; *Accipiter cooperi* Ridg. 431, C. 495.—Rare. An occasional visitant from the south. I have never observed this hawk in Maine, nor even seen a specimen killed here. Prof. A. E. Verrill mentioned it in his list of the birds of Norway, Maine. Mr. Boardman mentions it as "rare." Mr. N. C. Brown informs me that he has seen but two specimens here. One of these in the possession of Mr. L. C. Daniels, taxidermist, at Portland, April 15, 1875, and the other one was alive in captivity at Gorham, Maine, in the possession of Chas. B. Merrill, Esq. Mr. Harry Merrill gives me the record of two specimens killed in Penobscot county; one in 1878, and one in 1881.

Although not a very large hawk, this bird is endowed with great strength, daring, and speed of flight. Many hawks capture their prey chiefly by darting suddenly upon it, but the Cooper's hawk will pursue the swiftest of birds while on the wing, with a sustained flight, that I believe to be unsurpassed in speed by any other bird. I remember an incident that well displayed the wonderful rapidity of flight of which this hawk is capable.

One autumn day in Virginia, while shooting partridges, or quails (*Ortyx virginianus*), a partridge that had been well alarmed by a shot from each of my two companions, flew close by me, and at that instant I observed that a hawk suddenly increased its speed, as a Cooper's hawk gave chase. Swift as was the utmost speed of the partridge, yet much swifter was that of the hawk, which was quickly overtaking its prey as both birds disappeared from my view over the tops of a grove of small pine trees. The incident served to illustrate the facts that a swift-flying bird like the partridge, already frightened, was capable of greatly increasing its speed upon urgent necessity demanding it, and that a hawk of this species is capable of a sustained rapidity of flight even greater than the utmost speed of the *Ortyx virginianus*.

155. Sharp-shinned Hawk—*Astur fuscus* Aud.; *Accipiter fuscus* Ridg. 432, C. 494.—Abundant. Arrives in April. Breeds on trees. Lays four or five eggs, white with brown blotches, in May. Next to the marsh hawk the most abundant species of hawk throughout the State. This little hawk is not much larger than the rusty-crowned falcon, but in its appearance it seems like a miniature hawk. It is much more common than the Cooper's hawk. The sharp-shinned hawk is a deadly enemy to small birds, such as warblers and sparrows, but does not commonly attack birds larger than these. It is often locally, but erroneously, termed "pigeon hawk" in Maine. I shot a

hawk of this species in the month of December from a fruit tree at my house in Portland city. The bird was in fat condition and had probably been feasting upon the domestic sparrows, which are abundant here. This hawk is the only one of the species I have observed in Maine in winter. Probably it was a late migrant that strayed into the city, where an abundance of food caused it to tarry. I have many times observed hawks of this species in the city of Portland, Me.

156. Goshawk—*Astur palmarum* Aud.; *Astur capillatus* Ridg. 433, Cs. 496.—Common, especially in Eastern Maine. Resident. Breeds. This large hawk is sometimes locally termed "gray hen hawk," the light gray plumage of the adults distinguishing them from other large hawks of various species indiscriminately termed "hen hawks" by the farmers. But the immature bird is dark brown, with oblong spots of the same color diffused over its yellowish white lower parts, and this phase of plumage gives the bird an external appearance very different from that of the adult of the same species. A fine specimen in the brown plumage that I obtained in Eastern Maine in the month of October had nearly the whole of a ruffed grouse (including the feet) in its claw.

157. Red-tailed Hawk or Buzzard—*Bubo borealis* Aud.; Ridg. 436, Cs. 516.—Common. Arrives in March. Breeds. Lays its eggs in April. One of the largest hawks, whose great variations of plumage have caused several "varietal" names to be bestowed upon it by ornithologists.

158. Red-shouldered Hawk or Buzzard—*Bubo thurstoni* Aud.; Ridg. 439, Cs. 520.—Common throughout the State. Arrives in March and April. Breeds early in May. Of less size than the last named species, and like it locally termed "hen hawk."

159. Broad-winged Hawk or Buzzard—*Buteo borealis* Aud.; Ridg. 443, Cs. 524.—Common. Arrives in March and April. Breeds in May. Smaller than any of the buzzards (*Buteo*) previously named, and this hawk is locally termed the "chicken hawk," perhaps to distinguish it from the large "hen hawk," or else the farmers may think it not equal to the capture of an old hen. The small snakes native to Maine form the favorite and common food of the hawk, but not to the entire exclusion of other prey. The bird is less wary than the large hawks of the genus *Buteo*. A hawk of this species, an adult female, in plump condition, which I shot at Deering, Maine, May 6, 1882, had in its crop two snakes, one of fourteen inches length, headless, of the common variety, and a whole one nine inches long, of the red-bellied brown variety. The stomach contained only a large quantity of the undigested scales of snakes.

160. Rough-legged Hawk or Buzzard—*Buteo lagopus* Aud.; *Archibuteo lagopus sancti-johannis* Ridg. 447, Cs. 525.—Not uncommon, but apparently of irregular occurrence. In "North American Birds," by Baird, Brewer and Ridgway (II., 310), it is stated that "a pair was found breeding near the mouth of the Kennebec River, and the eggs were secured." And a description is given of "an egg from near Wiscasset, taken by Edmund Smith, Esq., the parent of which was secured" (II., 311). The latter quotation properly refers to Benjamin F. Smith, Esq., of Wiscasset, Maine.

Birds of this species whose general plumage is black, or brownish black, are probably of perfect maturity. Although this phase of coloration is usually termed meristic. The "normal condition" of plumage, or that of the first few years of existence, is mottled brown and black. I have observed specimens of this hawk in Maine in both these phases of plumage, and the proportion in numbers of each appears to be such as would be naturally expected between birds of full maturity and those not arrived at that condition.

161. Osprey, Fish Hawk—*Pandion haliaetus* Aud., Cs. 530; *Pandion haliaetus carolinensis* Ridg. 425.—Abundant. Arrives early in April. Breeds on trees; lays from three to five yellowish white eggs, profusely blotched with reddish and amber brown. Usually a very tall tree, and frequently a dead one, is selected as the site of a nest, but I have found nests within fifteen feet of the ground upon islands in the Gulf of Mexico, and upon one small island many fine hawks were breeding to form quite a colony. Although commonly nesting near the coast, a large stream, or a lake, I have seen a nest in the interior of Maine, two miles or more from any large stream or sheet of water. The osprey feeds exclusively upon fresh fish of its own catching, and is very industrious during the period that its voracious young are in the nest.

162. Golden Eagle—*Aquila chrysaetos* Aud., Cs. 532; *Aquila chrysaetos canadensis* Ridg. 449.—Rare. No record of breeding in Maine. I saw a fine male specimen of this eagle which was shot by Geo. A. Boardman, Esq., at Calais, Me., just before my arrival there, October 9, 1882.

While looking for snipe upon the meadows, Mr. Boardman flushed a blue heron, which flew lazily away and was just about to alight again when this eagle descended like a bolt from the sky, struck the heron to the earth, so near to Mr. Boardman, that he was able to approach and shoot the eagle ere it could kill the heron, which flew off apparently but little harmed. A golden eagle was killed near Portland, at Peak's Island, Casco Bay, in the autumn of 1881. I have observed this species on the coast of the Gulf of Mexico, where the white-headed eagles are abundant. In the "Bad Lands" of Northern Dakota the golden eagles are common, but I have not observed the white-headed eagle in that region.

163. White-headed Eagle—*Haliaeetus leucophthalmus* Aud.; Ridg. 451, Cs. 534.—Common, especially along the coast during migrations. Not commonly resident throughout the year, but occasionally observed here in winter. Breeds in high trees, lays two or more dull white eggs, in April or May, and sometimes later. For many years a pair of white-headed eagles bred within two miles of the city of Portland. A young bird taken from their nest and kept alive in captivity, attained, when six years old, the white plumage of head and tail characteristic of perfect maturity. The birds locally termed "gray eagles" are of this species, but in the plumage of immaturity, and without the showy white of head and tail. Frequently these immature eagles have a greater extent of wings than do the older birds. Mr. N. A. Eddy gives me his notes of an egg taken from an eagle's nest at Moosehead Lake, May 30, 1882, in which was a young bird apparently about ten days old. "The egg was addled and badly cracked." Probably the eagle or the nest had been disturbed earlier in the season. The white-headed eagle, which has been adopted as a national emblem, and called upon our silver dollars, is of noble appearance and possesses great strength. Breeds in trees and habits are not admirable. It will subsist upon dead and

putrid fish found upon the shores, upon dead dogs, horses, skunks, etc., wherever found, or lazily watch a fish hawk or plover procure fish and then rob the industrious captor of its prey.

When other means fail the eagle will earn an honest livelihood by hunting live prey, which it is well able to capture. Although usually successful in its attacks for robbery made upon the fish hawk, the crows will compel an eagle to flee, as will also the little kingbirds. During the season of love-making the white-headed eagles perform remarkable aerial movements, and their sexual union is accomplished high in the air. A pair may be seen soaring far above the treetops, until, uniting in an eagle's embrace they come gyrating down, with wings extended, turning over and over and oscillating about, their wings serving somewhat as a parachute and preventing a very rapid descent. Ere reaching the earth, or the treetops, above a forest, the birds separate and mount again on wing to resume their mutual demonstrations, or wend their way to some favorite perch for a rest.

#### FAMILY CATARTIDAE: THE VULTURES.

164. Common Vulture, Turkey Vulture—*Cathartes aura* Aud.; Ridg. 454, Cs. 537.—A rare straggler from the South. Two were seen in Sandish, Cumberland county, Me., in the summer of 1874, and one of them was caught in a trap and sent to a taxidermist in Portland, Me. Mr. Boardman has recorded the occurrence of the species in Eastern Maine. On account of its resemblance to the common turkey, this vulture is often termed "turkey buzzard," but the term buzzard properly applies to a genus of hawks (*Buteo*) only.

165. Black Vulture—*Cathartes atratus* Aud.; *Cathartides atrabi* Ridg. 455, Cs. 538.—A rare straggler from the South. This vulture is rather more Southern in its distribution than the common vulture. Mr. Boardman obtained a specimen in August 1879, which was killed by Mr. McFarland at Campbell's Island, near and near informs me that a vulture was killed at Great Meadow Island about 1870, which was supposed to be of this species. This vulture is quite commonly termed "carrion crow" in regions where the species abounds, and the name has probably been applied merely to distinguish the bird from the turkey vulture, and because it is "as black as a crow," the plumage of the other species named being of a golden-brown color.

#### FAMILY COLUMBIDAE: THE PIGEONS.

166. Pigeon, Passenger Pigeon—*Ectopistes migratorius* Aud.; Ridg. 450, Cs. 543.—Common, arrives in April. Formerly very abundant about the blueberry plains in Maine, but the great grain fields of the West and other causes have produced a very less number of the pigeons annually. Common. Breeds upon trees; lays two eggs, elliptical, pure glossy white, and similar to those of the domestic pigeon. First eggs laid in May. Two broods.

167. Carolina Dove—*Ectopistes carolinensis* Aud.; *Zenaidura carolinensis* Ridg. 460, Cs. 544.—Occasional visitant from the South. Rare. I saw one that was shot at Machias, Washington County, Maine, in 1879. Mr. C. Boardman reports its occurrence yet further East. Mr. C. Boardman obtained one April 6, 1879, shot in Cumberland County, near Portland city.

#### FAMILY TETRAONIDAE: GROUSE AND QUAIL.

168. Canada Grouse—*Tetrao canadensis* Aud.; *Canace canadensis* Ridg. 473, Cs. 555.—Common. Resident. Breeds on the ground, lays ten or more eggs, yellowish brown with dark blotches, in May.

This bird is locally termed "spruce partridge," also "heath hen." The reddish brown plumage of the female somewhat resembles that of the red grouse of Scotland, but the male Canada grouse is black and white upon its lower parts, and in general appearance differs much from the female. Both sexes have the red bare space above the eye. The downy young are yellow with longitudinal dark brown stripes, and they are usually hatched in the middle or latter part of June. But little has been written of the habits of the grouse of this species, and barely anything added to Audubon's statement, written in 1826, that "it is the most common species of grouse in the coniferous forests of Northern Maine and of Canada. In 'Birds of America,' by Audubon, and in 'North American Birds,' by Baird, Brewer and Ridgway, the two most comprehensive works on North American ornithology ever published, it is stated as hearsay, but not within the observation of the writers, that the bird is so stupid, that it may be backed down with a stick, or taken by slipping a noose over its head, and the 'drumming' is stated to be caused by the male beating its wings against the body as it rises 'spirally' in the air. I have the mounted skin of a male with the beautiful plumage of perfect maturity, and obtained the bird in Eastern Maine upon a rainy September day, in the following manner: Observing the bird upon the ground I at once made a noose of the only piece of line available, locally known as "stun-yarn," but not well suited to my purpose, as the rough hempen noose failed to slip readily. While making my preparations the grouse flew to a branch of a spruce tree, where he awaited further movements. Attaching the noose to a pole I passed it up between the branches and successfully slipped it over the head of the bird. But the noose failed to draw tight and the grouse flew to another branch of the same tree. Frequent attempts to draw it down by the noose, and the failure, and the bird then flew to another tree in a dense thicket near by. Finding my efforts with wet spun-yarn futile, I knocked the bird off its perch by a blow on the back with the pole and secured the specimen in good condition for preservation.

The Canada grouse performs its "drumming" upon the trunk of a standing tree of rather small size, preferably one that is inclined from the trunk of a larger tree, and in the following manner: Commencing near the base of the tree selected, the bird flutters upward with somewhat slow progress, but rapidly beating wings, which produce the drumming sound. Having thus ascended fifteen or twenty feet it glides quietly on wing to the ground and repeats the maneuver. Favorite places are resorted to habitually, and these "drumming trees" are well known to observers, and are to be led to the belief that it had been used for this purpose for many years. This tree was a spruce of six inches diameter, with an inclination of about fifteen degrees from the perpendicular, and was known to have been used as a "drumming tree" for several seasons. The upper surface and sides of the trunk were so worn by the feet and wings of the bird or birds using it for drumming, that for a distance of a dozen or fifteen feet the bark had become quite smooth and red, as if rubbed.

I do not regard these birds as stupid, but they are ex-

ceedingly gentle, and inhabiting dense forests are unacquainted with men. A friend of the writer now has a pair of Canada grouse alive, keeping them as pets in the hope that they will breed in captivity; and if a sufficiently favorable opportunity is afforded them he may reasonably expect this hope to be fulfilled.

[TO BE CONTINUED.]

GREBE—MAINE HERON—NIGHT HAWK.—Fort Covington, N. Y., Jan. 23, 1883.—*Editor Forest and Stream*.—Early in December this winter I bought and stuffed a bird of the grebe family which I failed to recognize. It was shot near the St. Lawrence. In shape it resembled the common hell-diver or dabchick, but was somewhat larger. Neck long and slender, head slender also, and "snaky" looking, bill narrow, straight and pointed, iris bright red, feet long and webbed as in other grebes, forehead, crown and nape, back and upper part of wings very black, cheeks, chin, throat and breast and belly pure white, dividing line between the dusky upper part of head and the white lower part sharply defined and starting from the bill, running through the eye straight back to the nape. No tail. Can you name him? I noticed to-day in Minot's "Land and Game Birds of New England," the statement that the long-billed marsh-wren (*Calidris palustris*) is not found in Northern New England. Without daring to dispute the above statement I can say that they are plentiful in the St. Lawrence River valley, around Lake St. Francis, and in the marshes in the various small tributaries of the above lake. They breed here, as I have often found their curiously-constructed nests while wading in the marshes in duck-shooting. I have, on several occasions, heard a whole chorus of them uttering their peculiar notes (to use a very pleasant chatter when disturbed) at a passing skiff or midnight boatman on the way, last summer while out in search of snipe. I shot a night hawk which was circling overhead with others. Not that there is anything remarkably surprising about shooting a night hawk, but the peculiarity was that while the others were decorated with the regulation white spot under each wing, he had the spot under one wing only.—GYRFAALON.

HAIRY, TAILED MEN.—This subject, on which our valued correspondent, "Piseco," wrote in *FOREST AND STREAM* so many years ago, is brought up again by the following extract from *Herald*: "There is now being exhibited at the Royal Aquarium in London a strange bird, a little creature named Kiao. Kiao is described as a very bright looking, intelligent girl of about seven years of age. She was caught, according to the account given of her, in the forest near Laos, and brought to England by Mr. Carl Bock, a Norwegian, who, since the expedition described by him in 'The Head Hunters of Borneo,' has been exploring Siam and the wilder States to the northeast. Hearing in various quarters of the existence of a new hairy-tailed men, similar in appearance to a family kept at the Court of Mandalay, he offered a reward for the capture of a specimen. A man was caught, and with him the child now exhibited, and a woman of similar appearance then allowed herself to be taken. When the little one attempted to wander the parentless girl uttered a plaintive cry, 'Kra-o' and her name has been adopted as her name. The eyes of the child are large, dark and lustrous; the nose is flattened, the nostrils scarcely showing; the cheeks are fat and pouch-like, the lower lip only rather thicker than is usual in Europeans; but the chief peculiarity is the strong and abundant hair. On the head it is black, thick and straight, and grows over the forehead down to the heavy eyebrows, and is continued in whisker-like locks down the cheeks. The rest of the face is covered with a fine, dark, downy hair, and the shoulders and arms have a covering of hairs from an inch to an inch and a half long. There is, it is said, a slight lengthening of the lower vertebrae, suggestive of a caudal protuberance, and there are points in the muscular conformation and otherwise which will provoke discussion. Kiao has already picked up a few scraps of English. She said to her of a great favorite, 'Dis-sit-tah,' and she shows truly feminine delight in her clothes, jewelry and ribbons. The showman exhibits her as the missing link."

EAGLES ON THE HUDSON.—Yonkers, Jan. 19.—The Hudson River has been filled from shore to shore with drifting ice for several weeks. It is at such times that the eagles which live on the banks of the river are driven to the shore. Several have been seen about South Yonkers lately. This morning as I was drawing a boat on a row sitting on a small cake of ice, an eagle swooped down within 200 yards, but did not light. These eagles appear very black, with white heads and tails, and are a pleasing feature in the winter landscape.—J. A.

OWLS—PIKE GROSBEAKS.—Colebrook, N. H., Jan. 29.—I have mounted three specimens of white owls. The largest had a wing broken by shooting; next in size, sixty-four inches; smallest, sixty inches. Three great horned owls taken in different towns were all strongly impregnated with skunk perfume. Do they eat all they can catch? The largest specimens of snowy owls are somewhat the darkest on back and breast. I have pike grosbeaks that commenced to sing six weeks after capturing them.—NED NORRIS.

WINTER BIRDS.—Princeton, Jan. 14.—This cold spell brought to us a large number of hawks, and consequently the quail and rabbits are suffering. Yesterday while out collecting I observed robins, blackbirds and song sparrows, and the common little tree sparrow. I also shot a cardinal grosbeak and a great northern shrike. Is it not very queer that the common spring birds, and a one that is only seen in the coldest weather, should be here at the same time?—W. S. K.

HUNTER'S RECORD.—Mr. La Monte Green, of Attica, Ind., publishes a "Hunter's Record," being a blank book ruled for recording the capture of game. The only criticism we can make on the book is that it is on a too extensive scale, but this fault is perhaps in its favor. The book will last a lifetime—for most sportsmen.

"EXPERIENCE WITH THE GROUSE."—In third paragraph of article under the caption "Issue of Jan. 18, for 'If you only shoot wild birds,'" read "If you only shoot treed birds." In last sentence of sixth paragraph, for "very old bird," read "wary old bird."

# Game Bag and Gun.

To insure prompt attention, communications should be addressed to the Forest and Stream Publishing Co., and not to individuals, in whose absence from the office matters of importance are liable to delay.

## THE NEW YORK GAME LAW.

A meeting of the Committee on Game Laws of the New York Legislature was held on Tuesday at Albany, to hear arguments on Assembly bill No. 8.

Gen. S. W. Johnson occupied the chair. Of the committee there were present Messrs. Helm, O'Connor, Locke and Bulmer. Messrs. Geddes, Irvin, Goddard, Bailey, Ferris, Church, ex-Senator Wagstaff and Dr. Piffard, of New York; Mr. J. D. Collins, of Utica; Dr. Phelps, of Franklin county, and a number of gentlemen from other counties appeared before the committee to represent their sections of the State.

The Chairman read the first section with regard to the change in the time for deer. Mr. Collins stated that Mr. Hoad had written him in behalf of the citizens of Ogdensburg, stating that they desired the privilege of eating trout and venison at the same time. He therefore suggested that the time in Bill No. 8 be extended so as to make the open season from Aug. 15 to Nov. 15. Mr. Irvin of St. Lawrence spoke for the sportsmen of that county, and opposed any alteration of the present law. He also strongly advocated the forbidding of the use of hounds. Mr. Goddard supported Mr. Irvin's statements. Senator Wagstaff preferred to leave November open. Dr. Phelps, of Franklin, made a strong appeal for the protection of deer from night shooters. He said that men came to the woods in August and slaughtered the deer by scores with jacks, and that it is impossible owing to the darkness to detect the offenders. He also gave a graphic picture of the manner in which the deer are killed during deep snows by men on snow shoes.

The Chairman then read Section 2 of the amendatory bill. Mr. Bailey, of Suffolk, said that the provision forbidding summer bay bird shooting was oppressive to the people of Long Island. Mr. Wagstaff favored the prohibition of spring bay snipe shooting, but would have the clause relating to ducks as it stands, i. e., no duck shooting after April 1. The representative of Oswego and Seneca advocated the forbidding of all shooting of ducks and bay birds after February 1, but stated that bay birds should be shot after July or August 1. Mr. Church, of Queens, requested that the bill might be so amended as to allow the use of batteries in Long Island Sound and adjacent harbors.

Section 3 was now read. Mr. Wagstaff hoped that the section would be so amended as to permit the shooting of woodcock on Long Island in August. A gentleman from Lewis county desiring to have that county excepted, and another from Wayne asked the same favor.

Sections 4, 5 and 6 of the bill seemed to be generally satisfactory.

Section 7 was read, and the representative of FOREST AND STREAM said that the provision limiting the number of specimens to be taken by any licensed collector during one year was oppressive to the ornithologists, and recommended that it be increased to twenty.

In Section 8, Dr. Piffard suggested that the English sparrow be added to the list of birds whose nests might be legally robbed.

The reading of Section 10 gave rise to considerable discussion. Mr. Collins explained that the provision forbidding the taking of trout of any kind at any time for the purpose of stocking private ponds, was aimed at individuals in his section who took private ponds, and who hire men, women and children to catch from the public waters all the trout that they can possibly take, and transfer them to preserves, from which they sell them. He stated, also, that these parties actually go to the spawning beds, secure the trout spawn, and transfer it to their private hatching houses, and suggested that this ought to be forbidden by law.

There was but little discussion over the following sections until Section 14 was reached, when ex-Senator Wagstaff suggested that the placing of a bounty of fifty cents on the foot of a muskrat be retained.

On reading Section 16 it was suggested that the time for selling venison should be extended to Jan. 1, provided that the time for killing was extended as above suggested. In Section 17 an exception was suggested in favor of tide water mills and of mill ponds.

The Chairman stated at the close of the meeting that the committee were anxious to give to sportsmen all the protection which they desired, but alluded to the very widely different opinions which seemed to be held on some important points.

### Editor Forest and Stream:

I am surprised that you advise the Legislature to open the season for bay snipe shooting on Long Island on August 1. Of course the date for opening named in the bill at Albany (October 1) only shows the ignorance of our game-law framers for after October 1 almost all the bay birds are gone. But a law opening the season at August 1 would only serve the purpose, if observed, of allowing many a good flight of such birds as dowitchers, which come back in July, to pass on to Jersey gunners. As bay birds come to our shores only on their way South (and back again the next spring), there can be no reason why a summer bird should not be shot whenever it arrives.

I am an earnest advocate of the prevention of all spring shooting; but I know that the Long Island people would pay no attention to a law forbidding bay bird shooting later than July 1.

### Editor Forest and Stream:

As to the catching of trout for stocking purposes. The reasons for this are very important; the most so of any provision in the bill. In this section of the country, men, women and children are employed to fish the small streams for small trout. They are kept alive in boxes and carried away to restaurants to be served up to customers—but the private ponds to be sold out in season. In Redfield, 160,000 were carried away alive in one season. At the Trenton Falls trout ponds an equal number are caught and sold each year. The proprietor fishes the whole close season, keeping his fish alive to stock his ponds for the coming season, taking them from spawn beds and small streams and in any way he can obtain them. There are other ponds doing the same

thing. The result is, the most abundant and prolific streams are utterly depopulated of trout. At other places, they are caught in the same way and placed in a public stream, upon premises owned by a hotel proprietor, where guests fish for them, to the detriment of all other streams for twenty or thirty miles around. Unless this practice is prohibited, good-bye to trout, and that very soon. The plan is, to let those who want trout for stocking purposes either breed them or obtain them from the State hatcheries, as is provided for by the laws relating thereto, which are independent of the game laws. If the friends of protection are interested in the protection of trout, let them by all means insist upon the amendments as framed, or even that they be more stringent than now proposed.

UTICA, New York.

JOHN D. COLLINS.

### Editor Forest and Stream:

Bay snipe commence to come about the 20th of July, and travel until about the first of November. These birds are all birds such as you shoot over decoys, namely the large and small yellow-legs, jack, curlew, robin, willetts, dowitchers, snipe, birds, and black breast plover. They return again in May, when there is a two weeks' flight. English snipe come here about the middle of March and stay until the first of May, and return about the first of October, and stay until it freezes up.

There is a lot of all kinds of shooting here all the time. The day it snowed and blew so hard I killed three wild geese in the river. I have killed some mallard ducks in the river this winter, the first I ever saw. I am greatly in favor of abolishing spring shooting. If something is not done soon, there will not be any game left. Battery shooting at ducks should be stopped from Maine to Florida. It is not any use to stop it in one State, because the birds would be killed in the next State. We could have the best duck shooting in our bay that there is in the world, if it were not for disturbing the birds on their feeding grounds. There are two market gunners who shoot to me, since last fall they have killed three thousand ducks, mostly broadbill, with some redheads, canvas-backs, and whistlers.

What point shooting we could have if ever the time comes that every battery is burnt up! There are three things we do not want, one is spring shooting, another batteries and finally cats. The cats destroy more quail than hawks and gunners combined.

SAVILLVILLE, Long Island.

### Editor Forest and Stream:

I wish to enter my protest against the amendment of Section 1, Chapter 534, which prohibits the shooting of deer with the aid of jack lights, or otherwise in the month of August. A friend and myself have, for the last seven years, spent from three to four weeks in the Adirondacks, and the last three years have each taken a son with us, the youngest being but eleven years old the first year that he went in. We always camp out, kill what deer we want to eat, also catch fish for our own use, and have not wasted or brought any venison out of the woods. Now August is the only month I can get away from my business, and I believe I speak for a large class of persons that are situated in a like manner. I also believe that if I had not taken just such a vacation, that my health as well as my friend's would have broken down, so that we could not have followed our usual avocations the remainder of the year.

The month of August is the best part of the year for any one wishing to hunt deer in the North Woods, and it looks as if the advocates of this change in the law wished to freeze out just the class of persons that it does most good to take this kind of recreation. Now from my own observation I think more deer are killed in July than in August. Only enforce the law as it now stands, and after what few are killed in August there will be a good show for those parties that wish to go in September and October with their picks of dogs and men that live out in the woods. Now August is the best time to go, and send their carriages out to sell to help pay for the sport. Now as I interpret the teachings of FOREST AND STREAM it is to go into the woods for rest and recreation; go in such a shape as not to make hard work of it, fish a little, hunt a little, throw care to the winds, and drink in lots of pure mountain air. August is the month that the greatest number of people who need just such recreation can go. I hope the law will be left just as it is in regard to shooting deer in August. They are then in good condition and the fawns are able to care for themselves; and may the time never come when there are no deer in the Adirondacks is the sincere wish of

HARK.

### Editor Forest and Stream:

Should the number of natural history specimens (of one species) allowed to be taken, be limited to five annually, as provided in the Townsend bill, or limited at all? Neither, decidedly; for at the rate of five per annum, it would require three or four years for one ornithologist to collect a series for a simple comparison, not to mention any extensive work with a species. And now, look at it in, perhaps a more practical light: Let a man start out to-day with his collecting outfit, his object being to collect some adult males of say *Agelaius phoeniceus* (lesser redpoll). Well, let him be fortunate enough to come upon a flock of this species containing several males; and now, while creeping up to pick out the rose-breasted leader, the flock takes flight and sweeps away, but not before our collector catches sight of a little rosy chap, and fires. What is the result? There lies the sought-for male, and with him perhaps a dozen others—females and young males—in plain attire. Now, according to the amendment he has broken the law; and what is he to do with the extra birds? To leave them there, when some brother ornithologist in the South would be most thankful to have them, would mean arrest and fines, or imprisonment for a man should mean arrest and fines, or imprisonment. If these are escaped, he still is conscious of law-breaking, which, though unintentional, is unpleasant, and causes a man to look upon the law as oppressive and wrong, because he cannot help breaking it while endeavoring to be guided by it. And now, our collector must wait a whole year, according to the amendment, before he can even try to obtain another male, and then perhaps break the law again by so doing. Should there be any limit to the number of specimens taken annually?

I quote again, as follows: "To Section 31, fixing the bounty on wolves, panthers, etc., is added a clause offering a bounty of fifty cents for hawks and owls. An excellent provision."

All men can not think alike, and I beg to differ from the above comment. Nature if left to herself will abso-

lutely balance all things. It is only where that desecrating monster, man, interferes, that the scales are not evenly weighted. A sportsman or gunner will shoot a hawk or an owl, either on principle or by instinct—perhaps both—whenver an opportunity presents itself, provided only he is not in the immediate vicinity of game. To offer a bounty on these birds means to have every boy and every loafer of the country village turn out with the old musket or like arm, to try to make a dollar or two by the bounty. Of course this causes a decided decrease in the number of birds of prey. And what of it? Why just as decided an increase in the numbers of predatory rodents and snakes, and consequently a corresponding decrease in the number of birds, both song and game. For we cannot forget that the food of our *Falco* and *Strigida* consists mainly of the small animals, reptiles, batrachians, etc. (only about five per cent. of the contents of the stomachs of the birds of prey examined by me have been avian remains, the remainder being either those of the mammalia or reptilia). And then too, all those notes that were in your paper some time ago, concerning the depredations of our saucy little red friend the red squirrel *Sciurus hudsonicus* must be taken into consideration, for he together with like plunderers, is quite an item in the menu of these birds.

The views expressed above agree with those of all the other members of the Linnean Society of this city, with whom I talked at the society's meeting of Saturday, January 27.

NEW YORK, February, 1883.

LOUIS A. ZIEGLER.

[The bill provides that the societies which may grant licenses to collect specimens shall be: The New York State Museum; the New York State Natural History Society; the American Society of Natural Sciences; the Linnean Society of New York City; the Lyons Scientific Association of Cornell University; the Poughkeepsie Society of Natural History; or other scientific college in the State having a department or museum of natural history.]

## THE QUEBEC ASSOCIATION.

THE twenty-fourth annual report of the Fish and Game Protection Club of the Province of Quebec, presented Jan. 20, was as follows: The executive committee, in presenting their annual report, congratulate the club, first of all, upon the unprecedented success which it has achieved during the past year.

This success is not alone confined to its financial affairs, which are highly satisfactory, as will be seen by the treasurer's report, nor yet to its great increase of membership, but it is to be found in the fact that the club has become known and its weight felt throughout the whole province.

The laws for the preservation of fish and game are becoming better observed every year, and people are beginning to find that the consumer is reaping even a greater benefit from their enforcement than the market hunter or the sportsman. Your committee has great pleasure in reporting that during the last session of the Quebec Legislature an act was passed for the better preservation of the game of this Province.

The following are the amendments to the game act (as it then existed) which your committee recommended, and which were adopted before the committee of the House by a denunciation, which twice visited Quebec for that purpose:

1. That the close season for deer, caribou, moose, and their fawn, should commence 1st January, instead of 1st February, to prevent these animals being butchered in the deep snows of January, and at a period when the females are heavy with young.

2. That the close season for partridge should commence 1st February, instead of 1st March, so as to give one month's additional protection, this species of game being rapidly exterminated by snaring.

3. That the close season for black duck, mallard, wood duck and teal should commence 1st March instead of 1st May, your committee contending that it is impolitic to molest these birds in the spring, when they come here to remain for the purpose of breeding; the numbers killed some seasons being immense, besides those that are driven from their natural breeding grounds.

4. That the snaring of hares be prohibited.

The following are the changes which were actually made in the law as regards close season:

1. Moose not to be taken or killed before 1st September, 1883. After that date close season for moose, deer, and caribou to remain as before—viz., 1st February to 1st September.

2. Close season for hare changed from 1st February and 1st September to 1st March and 1st November.

3. Close season for partridge changed from 1st March and 1st September to 1st January and 15th September.

4. Close season for wild ducks of all kinds, and geese, from 1st May and 1st September to 15th April and 1st September.

5. Close season for insectivorous birds, or more properly for all other birds than those named in the act, excepting eagles, hawks, wild pigeons, crows, ravens, waxwings, and shrike, from 1st March and 1st August to 1st March and 1st September.

Your committee, while regretting that deer, caribou, and moose have not received the protection asked for, and that the snaring of partridge has not been prohibited, consider that a great step in the right direction, and that the bill as passed is a very great improvement on anything we have heretofore had.

The thanks of the club are due to the Legislature for the manner in which they have taken up the matter, and for the kind consideration which they have shown toward the club. Throughout the past year the laws have been very well observed in and about the city. The dealers and markets have been closely watched for game and fish offered for sale, and the offenders have been taken into custody, and these were successfully prosecuted. Twenty-one convictions in all were taken by the club during the year, out of which we obtained sixteen convictions. Seizures were made at several times of fish and game in the hands of express and forwarding agents, that had been shipped to this province during our close season, and which was distributed among the hospitals and other charitable institutions of the city.

Our sportsmen are club members, and have a ready and willing to assist our officers. Thirteen unlicensed acts have been seized, and a great number of fish baskets and other illegal apparatuses destroyed. In many cases it was impossible to find the owners of these nets and traps. If the funds of the club will permit of it, your committee would strongly advise that an officer be kept on the St. Ann's District constantly

**NEW HAMPSHIRE BIG GAME.**—Colebrook, N. H.—We brought out in the month of September last, three caribou from Second Connecticut Lake. I mounted the heads of two, the largest had symmetrical antlers, 25 inches spread, 32 inches from point of brow angle to top of main branch, and ten points, estimated weight of about 535 pounds. Head can be seen in Exeter, N. H. I do not expect ever to see a larger one. Your correspondent "R" will be sad as he looks at this, they came from his favorite pond. I have not allowed the June jack-light barbarian to look at that unknown trail and in the future I will not act as guide for any man or party that brings along a gun to protect his miserable skin. If the deer were only many thousands more like these, there would be no pothunters and front hogs to infest the forest and pollute the streams. There would be no park improvement companies to slaughter the "antlered monarchs of the waste" to feed gangs of laborers, desecrating the lovely face of virgin nature to build high-roofed hotels for that modern vandal, the summer tourist, for there was only more of "cynical old buntings" like these. Ayre, "old woods loafer," may "be destined which slaps out" our guide any foresters some day to thy camp "amid the deer solitary groves where peace doth dwell," where I shall find no "greasy pack of cards" to detract from their surroundings, and where I may reverently look upon that old single barrel, that will never be held to bring down "the mother doe or her bright-eyed fawn" while thou art its master.—CAPT. DORSET FENN.

**"NESSMURK'S" SCHIED.**—Great, noble, glorious old "Nessmuk." Thy sentiments have "such divine complexion." With a "New Year's" greeting, I hope only many thousands more like these, there would be no pothunters and front hogs to infest the forest and pollute the streams. There would be no park improvement companies to slaughter the "antlered monarchs of the waste" to feed gangs of laborers, desecrating the lovely face of virgin nature to build high-roofed hotels for that modern vandal, the summer tourist, for there was only more of "cynical old buntings" like these. Ayre, "old woods loafer," may "be destined which slaps out" our guide any foresters some day to thy camp "amid the deer solitary groves where peace doth dwell," where I shall find no "greasy pack of cards" to detract from their surroundings, and where I may reverently look upon that old single barrel, that will never be held to bring down "the mother doe or her bright-eyed fawn" while thou art its master.—CAPT. DORSET FENN.

**GUINEA FOWL AS GAME BIRDS.**—Detroit, Mich., Feb. 2. *Editor Forest and Stream:* I read "Birds' communication" in *FOREST AND STREAM* of Jan. 11. "Guinea Fowl as Game Birds," wherein he says: "How these birds would like to a setter or pointer I cannot say." Three years ago last October I was shooting partridge, and when working through a very thick piece of cover, my pointer, Don, who had passed through the thicket, pointed stiff and staunch at a little clump of bushes about twenty feet ahead of me. I came up on the "ready," and after waiting a few seconds I jumped something and flew away straight and strong. I shot it and it proved to be a fine guinea hen. I was fully half a mile from my house; the bird was alone and lay to the pointer like a quail. I have no doubt that if a few guinea fowl were allowed to run wild in the woods they would skulk and hide like a quail or turkey after being hunted a little.—G. M. S.

**MASSACHUSETTS NOTES.**—Taunton, Mass., Jan. 27.—Quail and ruffed grouse are wintering well, notwithstanding we have had quite a few severe snow storms. Quite a number of ruffed grouse were shot in the open season, but enough were left to breed next season. Quail were plentiful when the season opened, but owing to the thick swamps and woods near the river, and the fact that they were ever ready to jump something and fly away straight and strong. I shot a large flock, feeding in an old cornfield, that I started yesterday, only two had been killed during the entire open season. Several other large broods lost but a few from their ranks, and if not shot during the closed season there will be a goodly number left to breed next summer. One snowy owl was taken in the vicinity of this place in November. Hares and rabbits are as abundant as usual, and several foxes have been shot this winter.—CHESTER.

**QUAIL IN NIAGARA COUNTY.**—Quail have not been so plenty in this county for years, owing probably to the past mild winter and favorable breeding season. Many good bags have been made in one day's shooting, among which were Abe Tenbrook and Steve Lockwood, 31 birds; T. F. Utley and Fred Hawks, 22 birds; Andrew and Wm. Patterson, 17 birds; and other parties report doing as well. I was told by a party last week that he knew of four or five flocks of quail that had not been disturbed, and I know of one brood within a half a mile of the city limits that had not been molested up to Monday last week. If what birds are left are well protected and we do not have too severe a winter there will probably be an abundance another season.—L. D. (Lockport, N. Y., Jan. 8, 1883).

**THE AIR-SPACE IN RIFLES.**—Philadelphia, Feb. 3, 1883.—*Editor Forest and Stream:* In discussing the "air-space" in rifles I expressly stated that bullets which were "wedged" by a "burst" if they fire rifles in which the bullets are stuck fast, or rifles which contain gross obstructions, such as sand, mud, snow or snakes. But it is of no use. Some people will continue to lug in those things, just as, to the end of time, they will continue to burst rifles by permitting such unnatural conditions to obtain. During the last three months, in experiments I am now conducting, I have fired over 500 shots hereon, and expect to prove my assertion exactly as it is in your issue of Nov. 23-30, 1882.—W. M. KEATH.

**RABBITS IN OSWEGO COUNTY.**—Oswego, N. Y., Feb. 2.—*Editor Forest and Stream:* According to the statute laws the season for hunting rabbits closed on Feb. 1 in this State. We have had in this county a board of supervisors passed a resolution a few years ago, giving any one the right to hunt or kill in any way, at any time during the year in Oswego county. No such local law is in force, and any one who kills, or has in possession, or offers for sale any rabbit between the dates of Feb. 1 and Nov. 1, commits a misdemeanor and is liable to a fine and imprisonment.—DANIEL BOONE.

**TENNESSEE NOTES.**—Quail in considerable numbers are being offered on our market, and at reasonably low prices, though I regret to say they are not bagged by sportsmen. Pot-hunters with nets and traps are doing the butchery as a rule. Other kinds of game are abundant, but, as with the quail, they are not the result of legitimate sport. In fact, the young sportsmen about Nashville have abandoned the very exercise. The few who have not, and have the means are off to Florida, where they find better shooting than here.—J. D. H.

**LONG ISLAND WILDBOWL.**—Extract of letter dated Good Ground, January 26, 1883, from William N. Lane: "The bay is all frozen over. I think we shall have lots of redheads here this spring. They come in the bay every day to look, and as soon as the bay opens they will be here. We shall have an inlet now to about a week. I think we shall have good gunning this spring, as everybody is cod-fishing, and there won't be many gunners. There is lots of feed for redheads, and we had more in the bay last fall than I ever knew in the fall."

**THE QUEBEC LAW.**—Fort Covington, N. Y.—*Editor Forest and Stream:* The new Quebec game law, which was put in force on account of the "sportsmen" who come in yachts and send out boatload after boatload of "hunters," stay all fall, kill any number of ducks, keep them until they spoil, and throw them overboard to the amount of two or three hundred at a time, has put a stop to the "chickens" who didn't scratch and spoil the garden. Should the chickens suffer as well as the "old hen?" Such is the law, however.—GUYRALFALCON.

## Camp Fire Flickerings.

"That reminds me."

IN the contribution from "Forked Deer" in *Camp Fire Flickerings*, issue of January 18, I see that credit is given to Mr. Newton Dexter for classifying the ibis referred to. I think that the *FOREST AND STREAM* must have supplied the name "Newton," for I am quite sure that "Forked Deer" is not acquainted with the gentleman, nor ever had any correspondence with him. My reasons for thinking as I do are: first, I received the wing and head referred to, and have them now in my cabinet; second, I sent "Forked Deer" a long account of the bird, which I obtained from Audubon and other naturalists' works; and, further, I made a drawing of a glossy ibis, which I sent with the letter containing the description. The above would not have been written had it not been for the tale connected with the killing of the last bird, the shooting of which he wrote me about, but never once hinted about "the edible qualities of the bird." "Forked Deer" and I have corresponded for some years, and he writes me of his shooting and fishing excursions, but he has never said one word about that dinner of glossy ibis on that farm in Mason Valley. How he must have suffered in mind the past three years! Only think of it!

I have never had an opportunity to try glossy ibis, so cannot judge of its quality for the table, but I have tried one bird which every one condemns as good for nothing, even to the editors of *FOREST AND STREAM*, and that bird is the horned grebe, commonly known as the dipper, tinker loon, hell diver, etc. Now don't laugh, for you may make a mistake, for the bird is good. Last October Mr. Payne and myself, while gunning for ducks in Narragansett Bay, killed sixteen grebes and thinking that they might be good (although I had never heard of anyone eating them), I took them home and cooked them for supper the next evening. A friend calling in at this time was invited to have supper with us, and he being something of an ornithologist and sportsman, was glad of the opportunity. I had taken the precaution to have something else ready in case the grebes did not turn out well, but we did not make use of it, for all at the table were pleased with the grebes. I wrote "Forked Deer" at the time about our shooting excursion and gave him an account of our grebe supper, and now that he may not go wrong on the grebe, I have sent him an explanation of how I cooked them. Grebe is good; but it makes a great difference how you cook them. Some day I may tell you how I did it. SAMUEL F. DEXTER.

PAWTUCKET, R. I., Jan. 22.

## Sea and River Fishing.

To insure prompt attention, communications should be addressed to the *FOREST AND STREAM* Publishing Co., and not to individuals, in whose absence from the office matters of importance are liable to delay.

There is, I think, a love of novelty in all anglers. We prefer to fish new waters when we can, and it is sometimes pleasant to explore, even without success, than to take fish in familiar places. New and the scenery is always worth finding.—W. C. PRIOR.

### POSITION OF REEL—WEIGHT OF RODS.

FOR some time I have been tempted to say something on the subjects contained in the caption of this article, but have refrained from doing so, thinking that it would be a work of supererogation. I am forced to do so now to defend myself and many good friends of mine from the idle aspersions of some of your correspondents. I hope those of your readers who may feel interested in this matter will refer to the articles cited, and read them in full, in justice to their authors, for I will only quote the points material to a proper understanding of this reply.

In *FOREST AND STREAM* of October 5, 1882, appeared an article entitled "The Henshall Rod," by G. L. Jordan, of Texas. In the course of this article occurs the following:

"When in Florida last winter with my friend, Dr. Henshall, I had only one rod. It was what he styled 'the coming bass rod,' with ash butt and lancewood second joint and tip. I think it weighs about eight ounces, but have not weighed it. I used that rod all the time while there, and have it now in as good condition as the day I got it, nor did I use but one tip during the time."

"As to the holding qualities of this rod, its 'give and take,' its supple elasticity, I don't think can be surpassed on earth."

"The bass that we took in that country are simply enormous, and an eight-ounce rod that will master these eight to ten-pound fellows is certainly good enough for the most obstinate stickler."

"But in using the bass-fishing in Florida with that little eight-ounce rod and a little silk line the size of three horse-hairs, I never lost a fish, putted a line, or broke a hook but once, when I had an old, half rotted line, a seven or nine-pound bass struck just as the line got kinked on the reel and snapped it."

"The rod that I have has the reel-seat behind the hand, and the first bass that I took in Florida—a five-pound one—came near cutting my finger off with the line. I then

took the reel off, placed it above the hand, and fished it out with a string. I had no more trouble afterward. I don't see the sense of a reel behind the hand, or where the idea even came from."

In *FOREST AND STREAM* of Oct. 19, "Floridian" proceeds to "enlighten" Mr. Jordan, and in the course of his article uses the following language:

"It did not occur to him (Mr. Jordan) that this was another thing for him to learn, and that the burning of his fingers was due to improper handling. For his benefit I will say that this position for the reel is the result of the observation of anglers for a long time, that a reel in front of the hand adds to the apparent weight of the rod, and one behind the hand tends to balance it. If Mr. Jordan will restore his reel to the old place and learn to use it there, he will never go back to the obsolete custom of placing it in front."

Now, Mr. Jordan knew perfectly well when he penned his article, that click reels on fly rods were properly placed behind the hand, at the extreme butt; but, as his remarks applied solely and only to bait-fishing and the use of bait rods and multiplying reels, he, of course, omitted any mention of the fly rod or click reel. He particularly mentions the bait he used—"half-grown bream"—and the manner of using it—"casting the minnow *à la* Henshall." Yet in the face of all this, "Floridian" tells him that his trouble was due to "improper handling," and advises him to replace his reel behind the hand, and never go back to the "obsolete custom" of placing it in front. Shades of Walton! What lamentable "angular" ignorance! The only way in which a minnow or other natural bait can be cast with a reel behind the hand, is the method employed by youthful anglers and negroes, who use a line tied to the end of a stiff pole. This consists in first throwing the bait behind, and then throwing it forward overhead, when, if the bait is not jerked off the hook, it is hurled into the water as from a catapult. Nothing heavier than the artificial fly can be cast nearly overhead, and this necessitates a very pliant rod. What will our manufacturers of rods say to the "obsolete custom" of placing the reel-behind in front on bait-rods? And how about this "the observation of anglers for a long time" that led to this "result?"

Mr. Jordan, thinking, perhaps, that "Floridian" misunderstood him, put in a rejoinder in *FOREST AND STREAM* of Dec. 28, in which he acknowledges the reel behind the hand in fly-fishing, and in fly-fishing, he proceeds to explain more fully his rod, reel and mode of using them, and asks: "How can you cast the minnow *à la* Henshall, with the reel behind the hand?"

To this "Floridian" replied in *FOREST AND STREAM* of Jan. 11, 1883. As his article is a short one, I will consider it *seriatim*. He says: "For the style of fishing that he (Mr. Jordan) aims at, he is right in having the reel in front of his hand, and especially with the reel thus used."

Then where was the necessity of finding fault with him in the first place? And why advise him to replace his reel behind the hand? Mr. Jordan clearly described his manner of casting in his first article. "Floridian" can truly say, with lingo: "P-r I am nothing, it not critical."

Then "Floridian" delivers himself of this sentence: "This is the style used in heavy sea fishing for striped bass weighing from five to fifty pounds."

"Floridian" here shows his utter ignorance of the style of angling alluded to by Mr. Jordan, and this fact, though so palpable in his first article to any well-informed angler, needed but this statement to confirm it. Sea fishing for striped bass is practiced with a very heavy and short, two-handed chum rod, and though a rapid multiplier is used, the casting is entirely and essentially different, as all intelligent anglers know, from that of casting the minnow, single-handed, "*à la* Henshall," as Mr. Jordan styles it.

"Floridian's" next sentence is overwhelming, far-reaching and crushing: "Dr. Henshall, like all Southern and Western anglers, believes in and uses heavy tackle, and for those who like that style it is good enough."

I would here enter my protest against this wholesale slander on "all Southern and Western anglers." In this assertion "Floridian" belies his *non de plume*, and this reminds me that it is solely to refute the slander of the "expert" anglers of the South and West that I have deigned to notice an anonymous writer. It is scarcely necessary to say to any angling reader of *FOREST AND STREAM*, except "Floridian," that "Southern and Western anglers," as a rule, use light and elegant tackle as those of any other section of the country. I will go further, and leave it to the tackle manufacturers of the East to affirm or deny, by asserting that, barring the "Cutkill" fly-rod from slugs for on any basis for which we have no use, Southern and Western anglers use lighter rods and lighter tackle, for the same fishes, than those of the North and East. So much in vindication of "all Southern and Western anglers," but for myself a word or two more is necessary.

Last summer I was soundly berated in the columns of *FOREST AND STREAM* for deprecating the use of very light rods for small fish in my "Book of the Black Bass." I made but one reply to the over-zealous and irate gentleman who inaugurated the discussion, owing to his unfairness in trying to commit me to the advocacy of "heavy rods," preferring to leave the matter to the jury of your readers, rather than to continue a profitless and acrimonious discussion. Out of this matter, as all are aware, ensued a controversy on "light vs. heavy rods," which was remarkable only for its latitude and wide divergence from facts, as the evident misapprehension on the part of some of the disputants. Of course, as in most discussions, ridicule took a prominent part, and such irrelevant and inelegant expressions as "holding hard and killing quick," "fishing for meat," "fishing for count," "bean poles," etc., were freely indulged in. Some spoke of "Dr. Henshall and his disciples" in connection with "heavy rods," even the fishery in his statements, was led to read about the "disputants" (in *Adirondack Notes*) to "Dr. Henshall and other advocates of heavy rods." And now comes the feeble echo of "Floridian." "Dr. Henshall, like all Southern and Western anglers, believes in, and uses heavy tackle." "But yet the pity of it, lagoon! O, lagoon, the pity of it, lagoon!" (I have been reading "Othello" lately.)

Now, it is not necessary to state to old readers of *FOREST AND STREAM* that I have, since the establishment of that journal, been prominent in the advocacy of light and elegant tackle for black bass fishing; and I flattered myself that I had done the angling guild some service by inducing the manufacturers to produce a short, light and elegant single-handed bait rod for black bass fishing, and in doing away with the long, heavy and cumbersome rods formerly used for that purpose, I have always contended for a standard

weight of eight ounces for both bait and fly rods, for the smallest calibers or rods manufactured, and for the best and most approved reels and hooks for black bass fishing. I have nowhere favored the use of a heavier rod, except for exceptionally heavy bass—averaging three pounds or more, as in Florida—in which case I have stated that a nine or even ten-ounce rod would be pleasanter to handle; but even here I inserted the proviso that the eight-ounce rod was sufficient in the hands of an expert. Now, unless an eight-ounce rod is considered a heavy one for black bass angling, I defy "Floridian" or any one else to show by the record, or in any other manner, where I have advocated "heavy rods" or "heavy tackle."

The next sentence in "Floridian's" reply is as follows: "The trouble with Mr. Jordan was that he had a reel that needs to be checked with the thumb placed on a trout rod, and then wondered who ever devised the placing of the reel behind the hand."

Most trout bait-rods have the reel bands "before" the hand, but Mr. Jordan's rod was not a "trout rod," nor a fly rod, but, as he explicitly stated, was a "coming bass-rod," or "Henshall rod" (as designed by me for black bass bait-fishing), but the manufacturer who sent it to him, for reasons best known to himself, makes and advertises this rod with "reel bands above or below the hand," and "with either standing guides or rings." It is too short for a fly-rod—eight and a half feet long, like Mr. Jordan, I can only wonder why the reel bands were so placed, unless for the benefit of such anglers as "Floridian." But the rod was an excellent one, and had another redeeming feature, it weighed just eight ounces; most makers of this rod make them too heavy.

"Floridian" then says: "He (Mr. Jordan) asks how can you cast a minnow *à la* Henshall with the reel behind the hand?" I can only answer, "you can't."

This is the only truthful and reliable statement in either of his little screeds, but then he goes on to say:

"That style requires the reel in that position, but for fine fishing a stiff trout rod with the reel behind the hand is desirable to those who prefer science to main strength."

Now "Floridian" evolved this sentence of contrivances out of pure malice. I verily believe, there is certainly no difference in either the style or the science of fishing, which base such contemptible inferences. "Fine fishing" and "science" and "main strength," forsooth, and with a "stiff" trout-rod at that—and with the reel behind the hand for "bait" fishing!

"O, most lame and impotent conclusion!"

"Floridian" caps the climax with this last sentence in his "reply," thusly: "I hope that we now understand each other, and that Mr. Jordan will eventually work up to the point of using the right rod and the right tackle." If consistency were the only jewel, "Floridian" would go unadorned. Yes, I think you "understand each other" perfectly. Mr. Jordan distinctly and repeatedly stated that his rod was a supple and pliant one, a little rod of eight ounces; that his line was a silk one the size of three horse hairs (it was size G, or No. 5, the smallest made). I gave it to him myself; and his reel a "Meek" (No. 2); and that with this light tackle he took many nice bass from five to ten pounds, playing some of them an average of half an hour each before he was able to land them, and, moreover, "Floridian" had just volunteered the information, in a preceding sentence, that Mr. Jordan's rod was a "trout rod," yet in despite of all this Mr. Jordan is told to "work up to the point of using finer tackle and getting more sport!" But where is the fault to be found in this tackle? "Floridian" graciously says that for "fine fishing" a "stiff" rod is best, and a "reel behind the hand," but he is silent as to the line, perhaps it also should be "stiff" for "fine fishing"—it might do to "stretch" it. But then, again, how is he to get "more sport?" Is it desirable to have a large fish tugging at a light rod more than "half an hour?" And, in this case, where does "science or main strength" come in? Or who displays the "science," and who the "main strength"—the fish or the angler?

If "Floridian" prefers a stiff rod and reel behind the hand in bait fishing he has a perfect right to enjoy and recommend that style, and I would be the last one to object to or find any fault with him for his preference, but he has no right to interfere with or decri the methods of others upon false hypotheses, willful assumptions and gross misrepresentations.

I am always open to conviction in all matters, and would gladly learn the merits of any particular mode of angling, or the desirability of any special feature of tackle, being always willing to cheerfully and patiently investigate them when brought to my notice in a proper manner, and will always defend my own convictions and reply to those who honestly differ with me when the matter is entertained in a gentlemanly and courteous way. JAMES A. HENSHALL.

LYNCHBURG, KY., January, 1888.

#### A MOSQUITO-PROOF TENT.

NOTICING with what unanimity my brother sportsmen complain of the persecutions of the mosquitoes, while in the woods, I am led to give them my experience, and it is quite extensive, beginning in 1872, in the mountains of this State, and since then extended to Upper and Lower Michigan and both shores of Lake Superior.

My first regular business interview with the mosquito was made in June, 1872, when I pitched camp for the night on the shore of Battleground Bay, near the mouth of the north shore of Superior. Our tents were sound and we had taken the precaution to hang two thicknesses of mosquito netting inside the doors. We turned in, but alas, not to rest. The sun had scarcely set when our friends began to drop in, and in a short time the air was thick with them; they went to work as if they knew they had not had a meal that season, and drove us nearly frantic. We dashed powder until the air was so thick with smoke that they were obliged to lie down in order to breathe; but it was of no avail, the smoke seemed just the same they needed for their meat, and finally we were obliged to take to the boats and lie off shore until morning, when we rescued our property from the tents and proceeded on our way. That night broke the spirit of P., who left for home the next day on a steamer we met at the mill. It was days before we recovered from the effects of the poison.

That and numerous other similar experiences disgusted me so much that I invented what probably many another sportsman has made, but I have never seen it mentioned in print. In the Lake Superior country I always use a size twelve, and in other places a size eleven inside the tent, from the front and back, and hang inside the tent. It is heavily bound at all the seams and has four brass rings made fast at equal distances along the ridge.

There are also other rings placed at intervals of, say a foot along the eaves, i. e., the angle of the roof with the wall of the tarlatan tent.

After pitching the canvas tent I hoist the tarlatan tent up to the ridge pole by means of cords made fast to the rings on its ridge and passing over the ridge pole. I then hook the rings along the eaves into hooks or snaps which are placed along the top of the wall inside the canvas, thus making the tarlatan fit snugly to the inner side of the canvas. The hooks and rings along the wall may be dispensed with and pins used instead, but I have yet to see the man who loved a pin.

The wall of the tarlatan tent should be made extra long so that, say, eighteen inches of it lies on the floor of the tent. Place your baggage along the sides and it will keep the tarlatan tight to the ground, and no mosquito or other pest can enter, save the few who slip in when you enter the tent.

Fine tarlatan or other similar material should be used, as the cheaper grades of mosquito netting are too coarse, and great care should be used in making it up. The seams and edges should be securely bound with linen or other suitable material to insure durability. The one I have was made in 1878 and is as good as new to-day.

My experience in the woods leads me to the following conclusions, which can be taken for what they are worth, viz.: That black flies are active in the daytime and prefer the open to the thick woods, while on the contrary mosquitoes are active principally at night, and in the thick woods and underbrush. I therefore pitch my camp in the woods, within a short distance of the stream, and am annoyed but little while attending to camp duty in the daytime, while at night I build a rousing fire in front of the tent, throw open the canvas front and lie inside the tarlatan enjoying my pipe, the cheerful fire a guard of camp and above all the angry protests of the infuriated mosquitoes who have assembled in clouds but can't get in.

The tarlatan is light and packs in a very small bundle, and when on the march should be packed inside the canvas or in a bag, to prevent it from being torn. This arrangement allows you the free use of your tent without the annoyance of being compelled to use a head net or other similar device.

I have called the attention of several dealers in sporting goods to my tent, but as yet know of none who have put them on the market.

A word in conclusion. I have found that cosmoline or vaseline with a little pennyroyal mixed in it is preferable to oil of tar for several reasons, one alone causing me to prefer them, viz.: that you can carry them in a box and are not troubled with the bottle breaking as it frequently does when you use the tar.

EMIL PAE, January, 1888.

#### JUGGING ON THE BIG MUDDY.

"DID you ever go jugging?" We had been telling the fish yards at the back office of Doctor G.'s drug store one hot morning in the latter part of July, when this question was addressed to the writer by the Doctor, who had just finished compounding a prescription he had advised for the party, and poured it into the several glasses containing broken ice. The listeners of the Doctor, while averse to taking medicine except when authoritatively prescribed, could not counterpoise his sincerity, or the generous motive which had suggested the careful mental diagnosis he had made of the party, and which he assured us was the proper thing to ward off the baleful effects of miasma, ever present along the turbulent Missouri.

"Did I ever do what?" I asked, as I sat down the drained glass and bit off a piece of the lemon peel it contained.

"Did you never go jugging for catfish?"

"Well, no, Doctor, you've got me. I have caught a great many kinds of fish in many different waters, even the ignoble catfish have I hooked and yanked out of my muddy bed, but what the jug has to do with catching this *Pimelodus*, I own I cannot see."

"Why, out here we go jugging once a year, and I presume it's because you never lived long on the Missouri River, or you surely would know its sincerity, or its motive. What say you, boys, let's take 'Finn' jugging."

"Why, certainly," chimed in the rest. "Finn, how long will you be in town? We'll go sure."

So it was speedily agreed that on Saturday, if I would stay so long, I should be initiated into the mysteries of jugging for catfish on the raging Missouri.

Was given an explanation of the sport, and the tackle which was used, beyond all pretension, or to be generously supplied by the Doctor and friends, as my own kit did not contain the articles needed. What was wanted, I was informed, was a boat and a dozen stone jugs tightly corked, to whose handles were tied six or eight feet of good line, with a large strong hooked attached.

The intention was to take passage with the boat and jugs on a river steamer bound up the stream Saturday morning, to a point about half way to the mouth of the Missouri, where the boat, with the hooks, heave over the jugs, which served as huge floats for the lines, and serenely drift along in company with the flat while we watched the jugs for a bite.

Saturday, after an early breakfast, the party of three and myself assembled on the levee, awaiting the steamer just coming in sight around the bend below the city. The boat, a heavy craft, belated at its destination to the eastward, rather a heavy craft, lay upon the landing and stowed under the seats along the bottom were twelve small stone jugs, all corked, and with short lines tied to their handles. This, to me, novel fishing outfit, attracted my attention, and while examining them I noticed one jug slightly larger than the rest, and though it had a cork there was no line to its handle. Turned to the Doctor, who had been watching my movements with interest, and he handed me the jug, and with a smile, he answered my look of inquiry with, "That jug don't need any line, it is for suckers, not catfish. Show you how it's worked when we get there." Of course this satisfied me. At least it not exactly satisfied. I contented myself with the thought of how easy it was to catch some kinds of fish.

The steamer soon lay alongside the levee, and out came the line and huge gangway peculiar to those craft. The rustabouts picked up the boat and its contents and deposited it upon the steamer, while we followed it aboard. The captain agreed to land us at a woodyard some fifteen miles up the river, where he stopped to wood up, and from which point we could launch our boat and jugs. We were soon off up the river, and as the sun climbed toward the meridian his rays gazed at strength and poured down in increased intensity. The steamer was loaded and the current

strong, so that she made slow progress against the stream, and it was noon when we reached the place where we were to disembark. As we were anxious to get back to the city before dark, we ate our lunch.

Wine and launch our boat and were off down stream, and prepared to commence the sport. Baiting the hooks with a piece of the belly and ventral fin of buffalo fish, which the Doctor had bought in the market that morning, we examined the corks of each jug, and overboard they went as fast as we could bait them. The Doctor and H. baited the hooks, while G., taking them when ready, stood up amidst slips, and swinging the jug in his right hand, held lightly the line and hook in his left, cast them as far out into the muddy current as he could throw. The Doctor, with the remarks upon the grace and distance of the casts as the jugs splashed into the turbid water, and G., each time trying to excel his former effort, stood up on the seat to get a still better swing. Making a grand effort and swinging the jug round in a circle, he leaned forward as he cast—just a little too far. The boat, which sat deep in the water, gave the line and hook in his left hand, and the Doctor, with the jug. His feet were the only thing that struck the mud, while he went out of sight with a splash and a lurch that half filled the boat with water. Evidence is conflicting as to how far his head went into the mud at the bottom—G. would never say when questioned—but only a brief moment passed, and he appeared with a splash and a gurgle a few feet from the stern, and dousing his head for a second or two, struck bottom on the edge of a sand-bar, and slowly waded out and sat down, a sadder and very wet man, while the boat, carried rapidly by the current, drifted some distance below.

I had put the helm hard down the moment G. went over, and every one in reach had made a grab at his heels as he went out, but it was done so quickly and the water poured in so that no one was able to look down to see what happened. In fact, it is likely, had we done so, we would have been capsized at once. The boat drifted with the strong current out of G.'s reach when he came up, so it was lucky for him that the river was low and the friendly sand-bar near; the water, too, being warm, the ducking, save for the muddy water, did him no harm and afforded grounds for an excuse. The boat, however, was once again under weigh again. It took some strong pulling to get the boat back to the sand-bar, where G., not getting the muddy water out of his ears. The sun blazed down with fury from a cloudless sky, and we were awful hot and tired when we reached it. While the rest of us got the water out of the boat the Doctor examined G.'s pulse, opened the jug, and prescribed for him, remarking that an excess of moisture upon the head, and the recumbent position, would have been a reason of the interior. "*Sinthus sinthus curatilis*."

It was soon under weigh again; our jugs were by this time all out of sight, down the river—even the ninth one, which had caused G.'s mishap, had disappeared, so we pulled rapidly along with our boat after them. We cast our net, the remaining ones, but no catfish were to be seen and kept on till the jugs in advance came in sight again.

Each jug was closely scrutinized as it came into view, to see if a fish had been hooked; but all were floating placidly higher and higher upon the dark water, mixing themselves up as they turned round and round in that eddy, or, carried on by the current, out by a sand-bar and lost in the single line. Having got them all in good sight, we lazily floated along, guided only by the rudder, and amused ourselves chaffing G. on his tumble.

"I say, G.," said the Doctor, "feel better now?"

"Oh, yes," said G. "I'm all right, I only wanted to see how deep it was."

"You've got a case of yours was the longest one you made," said the Doctor, winking at Finn.

"Your right, Doc," says H., "though for grace and dexterity I have seen better."

"Yes, boys, that's all right," answered G., good-naturedly, "but you all fail to see the most material point."

"Why, how's that?"

"It was not so much the cast that pleased the crowd, as the way he hooked it, immediately after he caught G."

The fun was interrupted at this moment by H. with, "Look! Look there, boys, a cat has got that jug out yonder. See how it bobs around. Something has got it, hasn't it, Doc?"

"That's a cat got hold of it I guess," said the Doctor, "Pull away boys, before he runs into that bayou."

H. and G. seized their oars, and in a moment were near the Western eddy, but for my eyes he had lost. The stream, the fishes effort and the current which circled and eddied about it.

"Steer above it, Finn," said the Doctor, "and the current will drift you on to it. Unship your oar, G., and stand ready to catch the jug, while I put the gaff in him as soon as he comes within reach."

And indeed, as we grasped the jug with both hands and hauled steadily. A jerk or two, a splash of a tail, and a great catfish stuck his ugly brownish-black head above water; another struggle and the Doctor had the gaff in his side, and with a flourish and a grunt he landed in the boat. He was hooked to stay in the bony jaw, and the Doctor, not stopping to unfasten it, gave him his quietus with a stab in the back of his head, which was a fair specimen of the Western eddy, but for my eyes he had lost. The stream, the fishes effort and the current which circled and eddied about it.

"There's another member of the family trying to run away with a jug," said G., who had been eyeing the other jugs in sight. "There that one right in the middle of the river, don't you see it?" The stream, the fishes effort and the current which circled and eddied about it, spreading out from bank to bank without a sandbar, and right in the middle of the current was one jug either stationary or coming up stream toward us, bobbing up this way and that, as if some mighty fish was towing it where he pleased, while all the rest in sight were sailing on placidly some distance below.

"All boys, pull, pull, the Doctor, standing up, 'that's an old wham got that jug.'"

G. and H. plied the oars, and with the strong current wiped along at a rapid rate. The Doctor clambered forward and stood up in the bow and as we neared it, G. laid down his oar and knelt down on the seat ready to grab it as soon as within reach. On we went with all the impetuosity of a pair of oars and the current, another moment and we shall be upon it when—did you ever notice how queer it feels to have the air brakes applied suddenly and strongly to a

We are obliged to have more room in our factory and greater facilities for manufacturing our goods to meet the increasing demand. We have received the highest award and silver medal at the Massachusetts Charitable Mechanics' Association Fair for our superior goods. Send for catalogue.

# FOREST AND STREAM.

A WEEKLY JOURNAL OF THE ROD AND GUN.

TERMS, \$1 A YEAR.—10 CYS. A COPY.  
SIX MONTHS, \$2.

NEW YORK, FEBRUARY 15, 1883.

VOL. XX.—No. 3  
Nos. 39 & 40 PARK ROW, NEW YORK.

## CORRESPONDENCE.

THE FOREST AND STREAM is the recognized medium of entertainment, instruction and information between American sportsmen. Communications upon the subjects to which its pages are devoted are respectfully invited. Anonymous communications will not be regarded. No name will be published except with writer's consent. The Editors are not responsible for the views of correspondents.

## SUBSCRIPTIONS.

May begin at any time. Subscription price, \$4 per year; \$2 for six months, to a club of three annual subscribers, three copies for \$10; five copies for \$16. Remit by registered letter, money-order, or draft, payable to the Forest and Stream Publishing Company. The paper may be obtained of newsdealers throughout the United States and Canada. On sale by the American Exchange, 440 Strand, W. C., London, England. Subscription agents for Great Britain—Messrs. Samson Low, Marston, Searle and Rivington, 188 Fleet street, London.

## ADVERTISEMENTS.

Only advertisements of an approved character inserted. Inside pages, nonpareil type, 25 cents per line. Special rates for three, six and twelve months. Reading notices \$1.00 per line. Eight words to the line, twelve lines to one inch. Advertisements should be sent in by the Saturday previous to issue in which they are to be inserted. Transient advertisements must invariably be accompanied by the money or they will not be inserted. Address all communications.

## PARK PROTECTION.

THE consideration of the Tariff bill and other matters have so occupied the attention of the Senate that the bill for the extension and proper protection of the Yellowstone National Park has not yet been called up for consideration. A matter of such deep interest to the people at large must not be overlooked, and we hope that before long it will receive the attention it requires.

The Park is the only one among the many natural wonders of this country that has not yet been turned into a peep show to fill private pockets, and it is hoped that it may yet be saved from the grasp of the unscrupulous monopolists who have endeavored to seize it.

From all quarters are heard protests against the grab, showing that the people are at last thoroughly aroused on the subject.

The letter from our correspondent "P." in another column calls attention to a wonder in the immediate neighborhood of the Park, as it at present exists, which should be saved to the people.

By so amending the bill, now in the hands of Senator Vest's committee, as to extend the Park sixty miles to the eastward instead of forty, as now proposed, and southward to the parallel of 43° 30', a great number of natural wonders which really belong in it would be included in the reservation. Such are the headwaters of Clark's Fork of the Yellowstone, of the Stinking Water, Gray Bull and Owl rivers on the east; on the south, the Three Tetons, and a considerable portion of the range to which they belong, Jackson's Lake and Hole, and a number of beautiful lakes, mountains and rivers which would add much to the attractions and the picturesqueness of our wonderland.

Even if it should not be thought advisable to extend the Park westward any further than Cedar Mountain, or what would be better, the 103th meridian, we hope that the extension to the southward may be made. Any one who

will look at a good map of the region will, we think, see the desirability of including within the Park a region of so much natural beauty as this.

Another most important provision which should be inserted in Senator Vest's bill is the one suggested by our correspondent, forbidding the erection of any building whatever in sight of the points of interest of the Park. It is only too true, as he asserts, that in their eager haste for gain the men who are seeking to secure control of the Park will not scruple to degrade its natural wonders to any use that may serve their short-sighted and selfish ends.

## VISIONS OF THE NIGHT.

WE know one "ardent sportsman"—he is not a thousand miles from our elbow, as we write—who is a crack shot in the field, and a better one in his sleep; the real bird rarely fails to drop at the explosion of his gun, the phantom never. Our friend was one night following his dog over the Elysian fields of dreamland, when the dog, coming to a point, wavered and flushed the birds. The sportsman, enraged at such a breach of duty, doubled up his fist and struck at the dog, planting a tremendous blow on the head. Perhaps the pain and the subsequent soreness of scarified knuckles had something to do with his conversion to that humane treatment of his dogs, for which he is now well known.

A somewhat similar experience one night befel our friend H., who was out on a visionary grouse shooting expedition. The birds were plenty and he was having a capital time of it. Old True pointed staunch; our hero walked up; the bird flushed and darted away in circuitous flight through the brush. Instantly wheeling and throwing his gun around to cut down the bird in an opening, the shooter's hand came in violent contact with the trunk of a sapling—and he awoke to find himself sitting erect in bed, his arms outstretched as if holding a gun, and his wife by his side, a very badly-frightened woman with a bleeding nose. He did not soon forget that dream, not so long at least as the black and black marks on his wife's face remained to remind him of his exploit.

But these misadventures are trivial in comparison with the fate which overtook Mr. Jno. L. Cross, of Highland, Virginia. One night, some months ago, we are told, Mr. Cross dreamed that he was pursuing a deer in the Alleghany Mountains, at the base of which is his home; and in the excitement of the chase he leaped from bed, and was severely bruised in the operation. One night last week the same phantom "stag" returned to vex his slumbers, and again the dreamer started on his fanciful chase. Hard-pressed by the hounds, the buck turned at bay, and the hunter, with a wild cry, springing to the scene of conflict, jumped from his bed and rushed headlong down a stairway, receiving injuries from which on the following day he died.

Such is the veracious tale of the press dispatches. There is a ready moral to the story, but we shall permit the reader to frame it, each in his own way.

It is well known that dogs dream of the field, and sometimes an experienced old dog, lying before the fire, will rise from the floor to a staunch somnambulist point, and then sink down again, still sound asleep. One of the most beautiful points we ever saw was thus made in his sleep by an unbroken puppy.

Sportsmen and their dogs dream of the pursuit of game. Does the game ever dream? May it not be that the sleeping deer springs from his slumber in affright at the visionary hounds upon his track? Is the sleeping circle of quail ever startled by the phantom form of a pointer or the horrible nightmare of a gun barrel? These are questions simple enough to ask, but hard to answer—like the letter that came to the FOREST AND STREAM the other day wanting to know the prospects for success in the diamond fields of Africa, and promising to send ten cents for a copy of the paper containing the reply, upon receipt of a letter telling the letter writer in what issue it would appear.

CLARK'S FORK CANYON.—In our "Sportsman Tourist" columns will be found a communication from our well-known correspondent, "P." in which he briefly describes the Yellowstone Park country, and gives an account of his exploration of the Grand Canyon of the Clark's Fork. This is, so far as we are aware, the first exploration and description of that region, which, in some respects, is superior in grandeur to the Yellowstone Park itself. Our readers will await with interest the more detailed account promised by our correspondent.

## THE DOGS OF HOMER.

IN a former article upon the chase in the time of Homer, we saw how highly the ancient Greeks valued their dogs for the assistance these gave in protecting their flocks and herds and in the pursuit of game. Aside from this much prized service, these animals were held in no less repute for their sterling qualities of sagacity and fidelity. Long before the time which is the object of our study, the dog had become the symbol of trustworthiness, for in Homer this character is proverbial. We cannot avoid drawing this inference from the fact that even then the figure of this animal wrought with skill in costly metal graced the entrance to the abode of wealth and taste. Hephaistos himself with highest skill fashioned of silver and of gold the dogs which were placed on either side the entrance to the palace of Alkinoos to protect the royal household. Homer quaintly adds that dogs of this breed are immortal, and are not liable to be all the time growing old (Od. VII., 91-94). The Romans of a much later time displayed a similar though less cultivated taste in the way of decorating the approach to their houses, for Petronius Arbiter mentions the practice of painting on the wall near by the entrance to the house, the figure of a burly watchdog, and just above the figure the words, *Uer, care capiam*. Look out, look out for the dog!

Priam, referring to the dogs he had reared in the palace, calls them not only the guardians of his gates, but also his messmates or table-companions (Il. XXII., 69). These table-dogs, as we may call them, seem to have been of a distinct breed from those whose duty it was to guard the house. They were kept as pets and for companionship, and were prized for their beauty of form and for their intelligent and affectionate character, as we shall see from what Odysseus says in reference to his old dog Argos. Nine of these table-dogs had Patroklos reared and trained as pets, and when their master's body was laid upon the funeral pyre two of the number were slain and their bodies burned with that of their dead owner, that their shades might float around his ghost in the sunless regions of the dead (Il. XXIII., 175).

Homer was a close observer of these animals as he was of the men who were their masters. Some of the poet's most delicate touches are employed in displaying their peculiar habits. No one having the slightest appreciation of nature can fail to note with pleasure the fidelity with which he pictures some of their more striking traits. In reading of his dogs, it is not easy to realize that they lived more than three thousand years ago, and are not waiting for us at our own or at our neighbor's gate. One of the most familiar passages is that in which is related how Odysseus came back to his home from Troy after an absence of twenty years in war, and in not less adventurous wanderings. Upon his coming to his native Ithaka, Athena changed his form to that of an old man infirm from years and from hardship, and his limbs were scantily clad with mean apparel. In this guise of a homeless beggar the hero came to the cottage of his old and faithful swineherd, who failed to recognize his master in such plight. To the four dogs that were lying outside the yards where the swine were brought at night for protection the new-comer was a stranger, and his unseemly garb but increased the fierceness of their ill-natured greeting. So bitter was their hostility, that had not Eumaios dropped in haste the leather from which he was then cutting for himself a pair of shoes, and rushed to the rescue of his guest, the dogs would have endangered the old man's life. (Od. XIV., 29). Further on in the course of his story, the poet tells how these same dogs behaved the next morning when they heard the familiar footsteps of Telemachos coming to the cottage upon his return from a short visit to Sparta:

Now the two men in the hut, Odysseus and th' excellent swineherd Breakfast prepared for themselves at the dawn having knifed a fire-Sent off the herbman in charge of the swine collected together.

'Round Telemachos favored the dogs accustomed to barking, But they barked not as he came. Then noticed the swiftest Odysseus.

How the dogs wagged their tails; and he caught the faint echo of footsteps.

Spoke to Eumaios at once addressing him words that were winged: "Really, Eumaios, some comrade of thine to thy cottage is coming. Or some acquaintance it is, since the dogs refrain from their barking. But they are fawning around, and I catch the faint echo of footsteps."

(Od. XVI., 1-10.)

But the completest picture Homer anywhere gives of the dog is found in the account he gives of the meeting of Odysseus with his old dog Argos. The passage is a familiar one, but it will bear a second reading by all who estimate at its full worth sincerity and devotion in friendship, though it be shown on the part of an humble brute. The

swineherd was too poor to entertain for any length of time the beggar who had sought his hospitality, and so he proposed to the old man as the best he could do for him that he would take him to the city where he might ply from door to door his vocation as a common mendicant. The poet gives the talk that passed between the two on their way to town, and as they entered the court of the palace from which Odysseus had set out for Troy, and then he adds:

That was the way they discussed such matters talking together,  
Only raising his head the dog pricked his ears as he lay there.  
Argos that long since was reared by those of Ithaca,  
Not for his master's delight, too soon to Ilion sacred.  
That one had gone, but the dog young men had formerly taken  
Going to hunt the wild goats, the deer and the swift-footed rabbits.  
Object of boasting then when long from home was his master,  
Lying on heaps of filth which was piled in front of the stables  
Where were kept oxen and mules manure awaiting the season  
When Odysseus the slaves should use this for dressing his acres.  
There lay Argos the dog all covered over with vermin.  
Then, indeed, when he knew Odysseus standing beside him  
Favored the dog with his tail, and he leaped both ears for his gladness.

Having no longer the strength that he could go to his master.  
That one turning aside lashed a tear unobserved by Eumæus.  
Raising a question at once with a view to diverting attention.  
"Really, Eumæus, a sight is this dog lying here on the dung-hill.  
Well indeed is he formed, but this I do not know clearly  
Whether in truth he is swift to run as his looks may betoken,  
Or if he be of such sort as attend to his masters at table.  
Such as gentlemen love to give them an air of distinction."  
Nor in reply to the man did thus speak, Eumæus the swineherd,  
"This is a dog that belonged to one who died far from his country.  
If he were only the same in form as well as in action,  
As upon going to Troy his owner Odysseus once left him,  
You would quickly admire observing his strength and his fleetness.  
For there was not any chance that game which he was pursuing  
Should in the forest escape, for he knew the game by the footprints.  
Now is the dog taken ill, and far from home has his master  
Held, and the neighborly women have no concern for his favorite.  
Well, but the truth is that slaves when their masters no longer give  
orders  
Not any longer themselves have a care to do what is becoming.  
Half at the least of his worth does Zeus whose view is extended  
Take away from a man as soon as he falls under bondage."  
Holding such converse he came to the palace pleasant to dwell in:  
Straight through the hall he went to join illustrious suitors  
Then indeed did the fate of dark death fall upon Argos  
Soon as Odysseus he saw come after twenty years absence,  
(104. XVII., 220-327.)  
I. B. CHOATE.

## The Sportsman Tourist.

### THE YELLOWSTONE REGION.

IT is believed that there is no part of the North American Continent where there is to be found so much (and of such varied character) as in those four States of country which is grand and beautiful and wonderful in nature, as lies within a circle, described with a radius of sixty miles, with its center at or near the outlet of the Yellowstone Lake, on the head of the Yellowstone River.

On the Pacific slope is that succession of beautiful lakes, bordered by beautiful parks, that are unsurpassed in this regard in any country, such as Jackson, Elv, Hart (justly called Shoshone on the maps), Lewis, and many many smaller lakes, though none the less beautiful. Overlooking this panorama are the highest and most remarkable mountain peaks north of the Union Pacific road, "The Three Tetons," whose needle-shaped pinnacles tower 8,000 feet above the waters of Lake Jackson, immediately at its feet, and 6,000 feet above the main Continental Divide, lying forty miles to the north. These peaks are nearly 14,000 feet above sea level, and are a noted landmark hundreds of miles down the valley of Snake River.

Overlooking this same region is the Red Mountain range, ten miles south of the main range. From the highest peak of this range, Mount Sheridan, (10,400 feet above sea level and 2,500 feet above Heart Lake, immediately at its feet) is the grandest, the most extended, and most beautiful view it is certainly worth a good fortune to enjoy. Several lakes are in view almost at one sight, while to the south is a very fine view of the grand "Tetons" and to the north is a splendid view of the Yellowstone Park proper, with Pilot peak and the high mountains at the head of the Clark's Fork of the Yellowstone River, on the horizon to the northeast, and the Shoshone range on the head of the Stinking River, to the east. The main Continental Divide, ten miles to the north and 2,000 feet below, with its small lakes and marshes and parks, almost on the very summit, is apparently a beautiful valley. This divide is not exceeding 400 feet above the waters of the Yellowstone and Heart lakes, and their waters might be intermingled by a canal not exceeding twelve miles long, and without the use of locks.

On the Atlantic slope are the various and very remarkable cañons of the Madison, the Gallatin, the Yellowstone, the Boulder, the Rosebud, the Clark's Fork, the Stinking River, the Gray Bull and the Upper Yellowstone. Near the center of this enchanted circle the most important waterfalls are the Gibbon (named from General Gibbon), the Gardner, the Tower and the Upper and Grand falls of the Yellowstone, the latter with a single vertical leap of 397 feet, the remainder with single leaps of from 120 feet to 160 feet.

What gives this region its celebrity, however, and entitles it to be called the "Wonderland of America," are the numerous groups of overhanging and spouting geysers scattered throughout its entire extent. At the head of these groups stands prominent the spouting geysers of the Upper Geyser Basin, on the head of the Madison. These are, doubtless, the most wonderful geysers of the world. Then come the groups at the Lower Geyser Basin, the mammoth Hot Springs on Gardner River, and the smaller groups at the Gibbon Basin, on Pelican Creek, on Alum Creek, and the various groups around the Brimstone, Yellowstone, Heart and De Lacy lakes. Besides these larger groups there are localities where the mountains are full of smaller groups, either active or extinct.

To most of the readers of the FOREST AND STREAM these wonders are more or less familiar, either from personal inspection or the description of others. In the past six

years it has been my good fortune to have explored the greater portion of this wonderful region, and I can truthfully report that the delineation of these wonders, either with the pen or the camera, falls greatly in coming up to the reality. New explorations are discovering new wonders each year.

A portion of the past three years has been spent in a hunting and exploring trip on the heads of the Clark's Fork, Stinking and Gray Bull rivers, most of which region is but little known, except to a few trappers; and the opinion is entertained that there is enough of the grand and wonderful in this region lying east of the present boundary of the Yellowstone Park to induce a trip across the Atlantic. The Shoshone Mountains, occupying this region, are one of the most rugged and remarkable of the Continental Divide, many of whose peaks are from 12,500 to 13,000 feet above tide-water.

Through this mountain chain the Stinking River has worn a deep valley, denuding in its course that most remarkable formation of red silicious pudding-stone conglomerate, that also crops out at the Lower Falls on the Yellowstone, and on the head of the East Fork of that stream, (forming what is known as the "Hoodoo" region of the mountain men).

At the upper valley, the South Fork of Stinking River is walked in by vertical cliffs of this formation, from 200 to 500 feet heights, that assume sometimes such fantastic and wonderful shapes that by their weird appearance they carry one back to the days of the fairies and giants of the story-books. Sometimes the mountain peaks are crowned by castellated structures of this formation. The most remarkable of these is "The Giant's Castle," a noted landmark of the upper valley. Space does not admit at this time of a description of this cañon. I can only say that it far surpasses in extent, and in every other respect, what has been published in regard to the "Hoodoo" region.

At the point where the Stinking River debouches on to the plains, bordering the Big Horn, is the easternmost outcrop of the geysers. At the lower end of what is known as the "Stinking River Basin" the two forks (North and South) join and for some miles the water is so clear and passable cañon, cutting off to the south "Cedar Mountain" from the main or "Sheep Mountain." From this point to the head of this stream, seventy miles west, there is no indication of geyser action. At the upper end of this cañon the side of Cedar Mountain is incrustated with this unmistakable formation, showing evidently that the hot water had at one time flowed down the valley, and left its deposit near the junction of the two forks. A rapid sulphur spring bubbles up, its waters highly surcharged with carbonic acid gas, while all over the bar and in the shallow water this gas is constantly bubbling up. This water has a sulphury, pungent taste, is a fine appetizer, and is to me as pleasant as the famous Saratoga water, with many of its good effects.

At the lower end of this cañon is quite an extent of this formation, with several craters of flowing or spouting geysers, but now extinct. Though the water has ceased to flow from these cones, it boils up from the bed of the stream, in one case in an immense spring extending half way across the river. From this spring bubbles up a large quantity of gas, supposed to be carbonic acid gas, with probably some hydrogen sulphide, for the unmistakable smell of this gas can be detected for some miles around. It is the peculiar nature that caused the Indians to give this river the present name, what in their language means "stinking." The "sign talk" of the Crows in alluding to this stream is most amusing and suggestive. The formation near this spring was almost pure alkali, of such an alkaline character as to burn holes in a silk handkerchief in a short time. There is, also, near an abundance of almost pure sulphur, with a warm sulphur spring on the opposite bank.

On two occasions I have crossed this stream in mid-winter. On one occasion, after leaving camp, above the forks, with both streams frozen solid, from a temperature of -32°, a few days previous, and approaching the ford below the cañon and looking into its clear and limpid waters, without even a skim of ice fringing its borders, the contrast seemed so marked as to suggest the idea of a "frozen lake." It is a slight pungent taste, as if produced by carbonic acid or dilute sulphuric acid. To produce this marked change in such a volume of water, and in so short a distance (two or three miles), presupposes the existence of many more and extensive springs near the center of this cañon. This stream has never been known to freeze over at this point, and yet there is said to be an abundance of trout to be caught at the proper season. This cañon will bear a great deal of investigation.

But by far the greatest wonder of the Shoshone Range is the Grand Cañon of the Clark's Fork, located near where this stream debouches on to the valley of the Yellowstone. As there is an old traveled trail passing within four miles of the deepest part of this cañon, it is the more remarkable that its wonderful features are entirely unknown to even the guides and mountain men.

During the past few years a half-dozen military expeditions have passed along this trail, but having no information of the locality, made no investigation. In 1879 I spent six days in the South Fork Park within six miles of it, but never happened to stumble upon it. In 1881 I spent two months on "Sheep Mountain" and within twelve miles to the south, and only saw enough to induce further investigation, but as it involved a descent into the South Fork Park for a few feet in a distance of 24 or 24 miles, and down a much dreaded trail, it was not undertaken that year. From a high point, at least 3,000 feet above the water below "Lookout Point," its most interesting features, then known, were discovered, including the "Zeta" Falls, formed by the "South Fork" apparently leaping out from a hole in the vertical wall into the main gorge. All these features were pointed out to Captain Seward of the army, on his way pointed out the national Park during that summer. As I have never seen his report, do not know whether the limited time at his disposal admitted of a further examination of this cañon, as neither of us were aware of the depth of the upper part of the cañon outlined in the distance before our eyes.

During the past summer (June and July, 1882), circumstances gave me opportunity to make this exploration. Having been detailed to the mouth of this cañon three or four days by the laborious and dangerous business of rafting my camp outfit of 1,200 pounds across this rapid stream, advantage was taken of the delay to explore the lower end for about seven miles, to a point where the cañon walls close in to the water's edge. This point, however, is only one mile below the lower edge of the South Fork Basin, which can be reached by a circuitous route, but having been detained by high water in the Stinking River, I spent several days in this exploration, at and below

the mouth of the South Fork. This involved a great deal of the severest labor (one day climbing up and down a vertical height of 2,600 feet), but the results amply repaid the effort.

I have seen all the principal cañons of Montana and Wyoming, and have seen enlarged photos of the Royal Gorge on the Arkansas River of Colorado, yet I have no hesitation in asserting that this cañon, in most regards, surpasses them all, and is only secondary, in this country, to the "Grand Cañon of the Colorado."

The lower seven miles of this cañon are rather open, sufficiently so for a good wagon road (at one place there being a little park). The walls rise up with a slope of about 1 to 1 with the highest peak on the East Side, of 4,000 or 4,500 feet above the water, and not exceeding 1,200 yards to the top on the horizontal line.

The point where the cañon shuts in to the water's edge is opposite "Point Lookout," 3,100 feet vertically above the water, and not exceeding 500 yards away on a horizontal line. Looking down from this height you imagine you can cast a stone into the water, apparently just at your feet.

From this point to a point just below the mouth of Cranial Creek, about twelve miles, this stream rushes through the cañon, and makes "crater" marks in the granite rock made by some convulsion of nature. The solid granite walls, shutting in the stream to the water's edge, are almost vertical, their slope being about 1 to 1, and near the lower end are at least 1,200 feet in height above the water.

From the south comes in Dead Indian Creek and the South Fork, through chasms of a similar character, except not so wide, and falling, from the fords on the trail near the level of the basin, three and one-half and four miles above, to the level of the main stream, 1,200 to 1,400 feet vertically. The former stream descends in a system of cascades and rapids the entire distance. The latter and much larger stream descends in the same manner but not quite so rapidly, until the gorge of the main stream is reached, when it loops out from the face of the vertical wall and tumbles down 300 feet below the water level, the first 100 feet being of the basin, three and one-half and four miles above, a single loop, the entire 200 in a succession of cascades. On the brink of the fall the width of opening in the wall is about 50 feet, with walls rising 700 or 800 feet, almost vertically, on each side. Near the top of this wall, on the east, is, apparently carved in the face of the cliff, the letter Z of colossal proportions. Hence I suggested as the name of these falls, "Zeta," from the Greek letter Z, which is the first letter of the word Zeta. The water appears shooting out from a hole in the solid cliff. Nor is this an inconsiderable river, as those can testify who have seen it at its average stage.

This stream joins the main stream about 200 yards above Dead Indian Creek (the military maps indicate they come together before their junction with the main river), and in that distance the side of the cañon is a mass of huge boulders, evidently deposited there by the main stream, in some convulsion of nature. One of these boulders, by measurement, contained 320 cubic yards, which would indicate a weight of about 700 tons.

The gorges through which these tributaries passed were scarcely secondary in interest to that of the main stream. On Indian Creek a point was reached stopping further down the cañon, where the water level was only 25 feet with 600 feet walls on each side. Just above and under the bend was heard the noise of no inconsiderable fall. On the South Fork was found a point where a stone could be cast into the water below with a little more effort than merely dropping from the hand. A succession of trials with as round boulders as could be found showed that their descent took eight seconds to the water. In testing, by the law of falling bodies, without allowance for air resistance, a depth of over 1,000 feet. A lead ball would have fallen in somewhat shorter time. The next day a descent was made, by a side gorge, to the water's edge, a little below, and the aneroid indicated 700 feet. This point was estimated 400 feet above the main stream. The width between walls at this point at top, as determined by the known curve of a tilted wall, was 100 feet, and at some points the main cañon was not exceeding 200 to 250 yards. The water channel was 75 to 80 yards. The main stream falls for the entire length of the cañon, say 19 miles, 2,200 to 2,300 feet.

I have thus briefly given the main features of this remarkable cañon, and will defer to a future paper to give more details. The vertical geysers are no guess work, but have been obtained by personal observation, the aneroid and aneroid barometer, checked by such means as the case suggested.

Comparing this cañon with that well-known one below the Grand Falls of the Yellowstone; it has something less volume of water, but is fully as long; has vertical, solid granite walls instead of walls of earthy material, with slopes of 1 to 1; its depth is greater, 1,200 feet, whereas I believe the depth of the latter cañon, at the point of Mt. Washburn, does not exceed 1,000 feet, with highest peak, within one mile of the water, of not exceeding 1,500 feet, whereas, the first named cañon has a peak of 4,000 feet height and within three quarters of a mile of the water.

There are no landscape views from points near the Yellowstone Cañon. There are, on the contrary, mountain peaks immediately overlooking the Clark's Fork Cañon that only give a magnificent view of the cañon below, including Zeta Falls, but one of the grandest views of park and distant mountain peaks to be had in Montana or Wyoming. There are peaks within twelve miles of this locality 12,000 feet above tide level.

I heartily concur in the recommendation of Gen. Sheridan, that the boundaries of this Park be extended, on the east to the line of Cedar Mountain and on the south to the forty-fourth parallel. I would recommend the southern boundary be extended further, to the forty-third and a half degree parallel, or at least far enough to include the "Three Tetons" and the Teton Basin. Hayden's Survey shows that none of this district will be of less elevation than 6,500 feet above sea level. I have never known any crops either in Montana or Northern Wyoming, to be raised at a greater altitude than 5,500 feet, so that no interest will be injured by the extension. The extension of the eastern boundary to Cedar Mountain will take in the "Stinking River Basin," the summer range of two large lands of cattle and some small bands of horses. That giftedly might be obtained by making the line pass through the "Two Sentinels" of Captain Jones's survey, situated immediately at the lower end of the Cañon of the North and about twelve miles west of Cedar Mountain Fork of the Stinking River. The extension of the western boundary, extending the length of this Park, to allow prospecting for minerals, and in case of valuable mineral deposits being found, to give facilities for

the working of such mines. There can be no serious objection to this proviso in the new bill.

Doubtless it has occurred to the minds of many visitors how invaluable the exclusive hotel privileges of this grand Park would be with the railroads approaching its borders. But who ever thought such exclusive privileges could be bartered away to anyone? It was, therefore, not to be wondered at that the public were surprised, a short time since, to learn that not only were the exclusive hotel privileges (with a large tract of land leased at each point of entrance) and the exclusive right to furnish transportation and guides, as to the public, etc., and been leased for a term of years to a syndicate of distinguished gentlemen for a mere song. To any one acquainted with the Park and its surroundings, it was apparent this magnificent wonderland was placed entirely under the control of a few individuals, and no one could visit it without their consent, or at least without passing through their hotels, guides, stages, etc. A man of moderate means even could not "do" the Park, much less the poor man who traveled in the old-fashioned but pleasant way, by pack horses and camp outfit.

I presume there is no one who finds fault with this syndicate of distinguished and patriotic gentlemen for accepting the terms of this lease. It is even claimed by some of their friends that some of these privileges were forced upon them. Who can blame them for accepting? One of them enthusiastically exclaimed, in the confidence of friendship, not only to the others but to the public, "there's millions in it," but there is "\$81,000,000" in it. But that a high official of the Government could be found who, in the absence of his chief, and, as it is understood, without his authority, and almost surreptitiously, as the papers have it, to contract away these privileges for a song, is a most remarkable occurrence.

The thanks of the people are justly due to Senator Vest, seconded by the trenchant blows of the FOREST AND STREAM, for turning the full glare of public opinion on this extraordinary transaction.

There are a few other points to be guarded in this lease that I have not seen mentioned, and they are respectfully commended to the attention of Senator Vest and his committee. It should be expressly stipulated that no hotel building nor bath-house nor structure of any kind should be erected in sight of any of these wonders of nature. Such an act would be an outrage on "the eternal fitness of things." This especially should be guarded against at the Upper Geyser Basin, where the hotel men, enterprising enough to lay their sacrilegious hands on "Old Faithful" and "The Grand," and who would quench their wonders by clapping a common square frame building over their craters, and utilize their perpetual-motion powers to supply their guests with hot and cold water. No building should be allowed within less than three hundred yards of this grand group of geysers. There is an abundance of hot water in the side, large and boldly discharging pools, with boiling hot water, for all bathing and culinary purposes, within one-half mile of this group.

Another requirement should be inserted into the contract; i. e., that the lessees should supply a great abundance of pure cold water, not only for their own guests, but for all other visitors. The water of Fire Hole River being almost always contaminated with the Geyser water, is unwholesome and unfit for drinking. A delicious water can be had from the extreme westerly fork of Fire Hole River, by bringing it in pipes 2½ or 3 miles, and with head enough to "squirt" much higher than Old Faithful. Good water can also doubtless be obtained from the main Fire Hole River by tapping it above the falls.

The length of this communication does not admit of an allusion to the game question, as intended. I see, however, in the Beacon paper, that additional contracts have been made for elk meat by the agent of the Park syndicate at seven cents per pound, also additional contracts for Cook City, and hunters have gone into the Park to kill elk for that purpose. Outside of all questions as to the "fitness of things," this syndicate can have beef delivered at that price, and of much better quality for food than poor elk meat. Elk meat at this season is unfit for food. P.

DENVER, Colorado, Feb. 12, 1893.

## THE NATIONAL PARK GRAB.

IN the course of a letter, written by John Schuyler Crosby, Governor of Montana, to the Chairman and Committee on Territories, under date January 17, he very pertinently says:

"A recent letter which I had occasion to write to Senator Vest on the subject of preserving the Yellowstone Park, as a refuge for the large game of the Northwest, I lightly touched on certain lesions made to private parties disposed to speculate in this national pleasure ground. But I did not mention the names of the speculators. As the newly appointed Governor of Montana, it was my duty to guard her interests in the public Park on her borders. But, as I learn from a special dispatch to the New York World, Mr. Rufus Hatch, disregarding my forbearance as to mentioning his name in an odious connection with a proposed trespass upon public rights, arraigns me by name, for guarding the interests of the Territory which I have the honor to preside over, and accuses me of posing as a public reformer. I cannot retort the accusation. Mr. Hatch has achieved a certain sort of national reputation as an unscrupulous monopolist and speculator. But it would be wrong to call these vicious things reform. I am not unwilling to be called a reformer. My great grandfather was one when he signed the Declaration of Independence. I should be sorry to forget 'the price of liberty.'"

I am attacked in good company to be sure, for General Sheridan, whose official report struck a damaging blow at the scheme of Mr. Rufus Hatch and his coadjutors, is fiercely assailed by this notorious monopolist and speculator, who, however, is totally mistaken in his statement that the letter to Senator Vest was written from General Sheridan's headquarters. Neither General Sheridan nor any of the officers at his headquarters, ever saw the letter till it was ready for publication, though I believe he, in common with many patriotic men who do not believe in the business of feathering nests by plucking the public, approved of the sentiments of the letter. Mr. Hatch's dissent is natural.

The issue between Mr. Hatch and myself is neither important, nor of my seeking. The real issue is national, and personal. It is whether the Yellowstone Park shall be, in the language of the dedicatory statutes "a public park and a pleasure ground for the benefit and enjoyment of the people," or whether it shall be the cattle ranch of Mr. Rufus Hatch et al., who propose to establish vast "cattle enterprises" on the Park and secure unlimited forage and immunity from disturbance in their trespass, by controlling the

Park as hotel monopolists, who lease some four thousand acres embracing every object of interest to the tourist, and mean to let their cattle obtain free pasture over the remaining millions of acres. The issue is "shall the public, or shall a band of speculators profit by the Yellowstone Park?" Mr. Hatch knows that if he shall carry out his defiant threat to push his cattle ranches close to the Park, the cattle will swarm into it. That is his purpose in choosing this proximity. By his monopolistic schemes within the Park he intends to exclude all trespassers, except his own. No possible feud could separate Mr. Hatch's cattle from the public domain that he could obtain. The Government's great purpose of the Park, as an asylum for the hunted game of the Territories that border it, The fence would exclude the game also.

It is rather amusing to have Mr. Rufus Hatch pose as a patriotic and public spirited citizen. But so he does, according to the World's dispatch. Yet it is demonstrable that his patriotic desire to protect the National Park, came into being only when he proposed to make money out of it by monopolizing every curious feature of it, and running his "cattle enterprises close up" to it. Because he is proposing something prejudicial to the Territory which I have the honor to govern, and hostile to the interests of the great Northwest, and odious to unselfish public sentiment throughout the United States, I need hardly apologize for taking a little space in following him through his inconsistent statement of motives. He has unwisely uncovered his own too soon, and shown that my letter to Senator Vest was not premature. Under Mr. Hatch's accidental avowals, and his impudent defiance of Congressional action or any interpretation of contracts but his own, he has made it clear that if any man in the United States is not to be trusted with the slightest power within the Yellowstone Park, that man is Rufus Hatch, of New York.

## AROUND THE COAST OF FLORIDA.

BY DR. J. A. HENSHALL.

### Fourth Paper.

WE soon came in sight of the Indian village, a cluster of twenty-five or thirty huts, on the ridge of the pine woods, where we soon landed, and were immediately surrounded by the young bucks, who looked on with great interest and curiosity as we unpacked the canoe. Cuff was at once at home with the Indian dogs. Big Tiger then came down to the landing, and pointing to a group of two or three huts a little distance inland, he said:

"You lose—you eat—you sleep—in-cah!"

We carried our plunder to the huts indicated, followed by the young bucks, who were much interested in the guns, rifles, and especially in the fishing rods, the use of which had to be explained to them by signs.

This village is one of several, where dwell the four hundred Seminoles yet remaining in Florida; the largest village is in the "Big Cypress" swamp, thirty miles distant. These villages or communities are governed by petty chiefs, who owe allegiance to Tallahassee, the great head center, who lives sometimes at the Big Cypress and at other times at Peace Creek. This village was governed by Little Tommy and Big Tiger. The latter is the son of old "Tiger-tail," the late principal chief of the Seminoles, who had been killed by lightning a year or two before. Tiger-tail fought all through his life, and was said to have been one hundred years old at the time of his death. Besides Big Tiger and Little Tommy there were Big Charley, Tommy Doctor, and several others with their squaws and families, half a dozen or more young bucks, several old women, a good many children and a host of dogs. The sun was setting in the Everglades as we got everything up to the huts and prepared supper.

These Indians lead a quiet, peaceable and semi-pastoral life, cultivating fields of corn, pumpkin, sweet potatoes, beans, bananas, etc., in the rich hammocks on the adjacent islands, their villages being in the pines or the border. They also make starch from the "comple," or wild arrowroot, which grows abundantly in the pine woods, and in the water they hunt deer and bears. Such a life is not without its charms, shut out, as they are, from all the world, by impenetrable cypress swamps, the only avenues to civilization being by way of the streams which drain into the Everglades, the currents of which are so swift during high water that few attempt to ascend them to the Everglades, and still fewer succeed. In the spring and early summer the Everglades are comparatively dry; as Big Tiger said: "In two moons all water gone—cause no go more." During the autumn and winter the men go to the settlements near by, to Miami on Biscayne Bay, by way of the Miami River, where they sell deerskins, buckskins, beccaws, complete starch, vegetables, bird plumes, alligator teeth, etc., and buy cloth, calico, ammunition, tobacco, etc., and occasionally wy-ho-nce (whisky).

The men are tall, well-formed, straight and clean-limbed, and are quite neat in their dress, which consists of a calico shirt, a belt, breech-cloth and a turban; the latter is a head-dress quite remarkable in its construction and comports with pictures in appearance. It is some two feet in diameter and six inches thick or high, with a hole in the center to fit the head. It is formed of bright-colored shawls, the outside layer being sometimes a light red cotton or bandana handkerchief; its shape is exactly that of a flat cheese, or a grindstone. It is quite heavy, and the body must be carried very erect to keep it balanced on the head; perhaps the erect carriage of these Indians is to be accounted for, to a great extent, by the wearing of this singular head-dress, for they are never seen without it, except sometimes when hunting.

The men's legs and feet are always bare, and look like columns of polished mahogany; sometimes when hunting in the scrub, they wear buckskin leggings and moccasins. The women dress in short calico petticoats and a jacket or short seque of gay-colored cloth. Their necks are ornamented by many strands of beads, sometimes a hundred or more, and weighing from five to ten pounds. The young women and bucks have usually very good features, and are of very valuable of their personal appearance. The hair of the men is shaved at the sides, that on the top and back of the head is formed into a long plait and coiled on top of the head. The women dress their hair in a way perfectly incomprehensible to me, though plait form a part of the arrangement. The old squaws are not dressed with good looks, and do the drudgery of the camp, and are very old, though they are full of fun; some of the boys go entirely naked, though during our stay they wore short calico shirts. The boys are never without their bows and arrows, in the use of which they are very expert, killing quail and other birds, hares, squirrels, etc. The older ones, with their dogs, hunt gophers (land-tortoises), and spear aquatic turtles and fish. The two sub-

chiefs, Big Tiger and Little Tommy, wore a kind of hunting shirt of light blue calico with a broad collar, the whole ornamented with bright-colored fringes, and strips of turkey-red calico along the seams. These Indians have agreeable, musical voices and talk in low, pleasant tones.

The houses are formed of upright posts set in the ground, a thatched roof of palmetto leaves, and a floor about three feet from the ground, the sides being open. They sit on the floors during the day, and sleep on them at night, their beds being rolled up in the day-time. They all sleep under mosquito bars, which are latched up during the day. The houses are A-shaped, and are closed, thatched all around, with a door in one end. At one side of the village is a level, cleared space with a tall pole in the center, where they hold their dances at stated periods, the "green corn dance" being the most important. These are occasions of feasting, revelry and the wildest enjoyment, in which, wy-ho-nce (whisky), as in more civilized assemblages, takes an active and prominent part.

As the twilight faded upward, and the darkness closed around, the night was filled with wonders. Small campfires were kindled in the open spaces between the huts, casting a ruddy glare around, lighting up the gay attire and swarthy features of the Indians as they silently moved about, gilding the trunks of the lofty pines and setting the shadows dancing and flitting through the open huts. The white smoke drifted upward like tall ghosts and disappeared in the gloom above the tree tops. The young moon hung low in the west, carrying the "old moon in her arms" across the mysterious wastes of the Everglades, leaving a trail of silvery tracks behind her. The jeweled belt of Orion and the flaming Southern Cross blazed in the heavens above, while myriads of fireflies flitted and flashed their tiny lanterns over the slender spires of reeds, rushes and rank grasses, their reflections gleaming and sparkling with the stars in the still reaches of the channels. The air was heavy with the tenderness of balmy shrubs, honey-scented flowers and the spicy aroma of the pines. Strange night birds flitted by on noiseless wing, great moths wheeled about in erratic flight, and fierce beetles went buzzing overhead. The chuck-will's-widow was calling loudly, and the great horned owl woke the solemn echoes of the dense pine forest, while an incessant twittering and chattering of waterfowl, the piping of frogs, and the occasional bellow of an alligator came from the marshes. What wonder that the Seminoles found the night so full of interest and so very busy homes.

We repaired to the largest campfire, where the Indians of the village were sitting and lounging about. The squaws, each with a babe in her lap tugging at the fount of nature, were shelling beans, pounding hominy or pulling buckskin, the men looking on, talking and smoking, and the children and dogs romping and playing. We were offered the best log at the fire and sat down. I performed a few simple sleight-of-hand tricks, such as, by palming my half-dollars, making them disappear and then taking them from under the young men's turbans, out of the older men's tobacco pouches, or from under the boys' shirts; but they were especially delighted when I took two from the mouth of a baby. Other tricks were performed with a string and a handkerchief, which were received with grunts of applause and nods of approbation. They wanted Squire, Jack and Skipper to do something, but I told them I was "medicine man," and that the boys must go home, as no go dry, which they pleased them amazingly. Skipper then put Cuff through his paces, who is a very intelligent dog and performs a variety of tricks. There was a large garish roasting on the coals, at which Squire spit tobacco juice as at a target, in spite of Jack's nudges, and he seldom missed the mark. I said something about baked fish and tobacco sauce, but still, as Jack said, "he didn't tumble to the racket." Finally a squaw turned to me, when Squire "tumbled." "I thought it was a stick of wood," said he apologetically. But the busting did it no harm, for the squaw cracked it open with a stick, the horny covering parting in halves like a bivalve shell, the meat appearing white and savory, which was divided among the children, together with some sweet potatoes which she raked out of the ashes.

The young bucks and squaws are not allowed to talk to the white men, and for this reason, about; they affect not to understand, answering only, "Dunno," or "No." But get the bucks apart to themselves and they can talk "Englis" well enough for all practical purposes. Big Tiger prides himself on his ability to "Englis" talk, good. I asked him why he did not succeed his father, Tiger-tail, as "Big Chief" instead of Tallahassee. I gathered from his answer that it was (as in the affairs of some other people) the man who talked the fairest and promised the most who was selected. He said:

"The chiefs and officers have council. All come. All smoke. One man get up—talk, talk, talk! No lie—good talk. Other man get up—talk, talk, talk! No lie—must good talk! Every man must talk, talk! Every man good talk—must no lie! When all men talk, they say who chief. Tallahassee he talk heap—good talk—no lie—make him Big Chief; but," he added commiseratively, "lie no 'Englis' talk, no 'Englis' talk, no 'Englis' talk!"

Capt. Hendry, of Fort Myers, took one of the young bucks (whom he is educating) and Little Tommy to the State Fair at Jacksonville a few months before. I asked Tommy what he liked best of all things that he saw there; he answered, "Big hog!" The admiration of these Indians for hogs (of which they have a number) seems to surpass that of all things else.

One of the great Big Tiger if he was fond of wy-ho-nce (whisky); he said:

"In-cuh; little wy-ho-nce, good; too much wy-ho-nce, ho-la-wat-gus! You got 'um?"

"No; where can I get 'um?" asked I.

"Miami, you get 'um; Key West, you get 'um. Miami wy-ho-nce, ho-la-wat-gus! Key West wy-ho-nce, good, in-cuh! Miami wy-ho-nce, me got 'um; in four days (holding my hand) I get 'um, me got 'um. Ho-la-wat-gus! Key West wy-ho-nce good! No sour; strong! In-cuh!"

We discovered that night why the Indians used mosquito bars, but my pen is inadequate to describe the many hardships and torments we endured through neglecting to take ours with us. We slept, or rather tried to sleep, in the hut assigned to us, where by maintaining a circle of fires and smudges around the open hut we managed to pass the night. We spent two days at the village and were much interested. The Indians are good hunters and fair shots, but we beat them all at the target; we thought it necessary to do so in order to convince them of the superiority of the white man's rifle. During the day we modified their defeat, however, by attributing our success mostly to our superior rifles, which they told them were even inferior to most rifles now made. Jack then kicked the fat into the fire by beating each Indian with his own gun; but

Boardman, Esq., who has obtained a single specimen, shot near Eastport.

178. Turstone—*Strophilus interpres* Aud., Breg. 500. Common along the coast during spring and autumn migrations. Arrives in May. This little bird of variegated black, white and reddish brown plumage and orange-red feet, is sometimes termed "calico-back." It frequents the rocky and sandy shores, and is rarely found far inland.

[TO BE CONTINUED.]

## THE CARRION CROW.

(*Corvus atratus*.)

THIS vulture, so abundant everywhere in the South, in company with the well-known "turkey-buzzard" (*Cathartes aura*) is rather a peculiar bird. Neither of the two proper buzzards, but they are almost everywhere called so. They are true vultures. Here, both species are called indiscriminately, "turkey-buzzard," though a very few individuals make a distinction, some calling the carrion crow proper, turkey-buzzard and others, giving it its proper name. A person who does not notice birds particularly, would call both species buzzards, or turkey-buzzards indiscriminately, seeing no difference in them. But to one who notices birds with any particularity, they are quite distinct.

I will give a short description of each, italicizing the main points of difference.

*Carrion Crow, Cathartes atratus*.—Blackish brown, quills (primaries) *ashy gray* on their under surface, *head red*, feet *pinkish*; *bill bluish*, *skirt* of head corrugated with a few bristle-like feathers; *plumage commencing in a circle on the neck*; nostrils very large, open, *upward*, *tail rounded*, length about 24 feet, extent 6, wing 2, tail 1.

*Turkey-buzzard, Cathartes aura*.—*Blackish*, quills *very pale*, almost *whitish*, the *mid-veins of the first seven quills* *primaries* *pale*, *white* *above*, *black* *below*; *skirt on the head* *is in the turkey-buzzard*, *corrugated*, but of *the first three* *quills* *bill and feet* *grayish yellow*; *smaller than* *aura* *in linear dimensions*, but a *heavier*, *stronger*, *more active* and *coragacious bird*; length about two feet, extent about four and a half, *tail square*. The plumage commences *at a point on the back of the head*.

The habits of the two birds are very similar, except in this, that the carrion crow, so far as I have observed, appears to find a recently slaughtered or dead animal much more quickly than the turkey-buzzard, and seems to seek after, and be much more fond of, freshly dead animals, not putrid, than the turkey-buzzard. In this it seems more like the raven of the North and West, yet it will feast on the most putrid flesh. Again, if one kills a deer and hangs it up in the woods in the morning and leaves it through the day, he will generally find it mutilated or destroyed by the carrion crow before evening, but old hunters say that if the animal is hung by the head, with the forelegs carefully turned down, the crows cannot get a foothold on the carcass so as to injure it.

The crows do not always find a deer, when hung up. I recollect one instance in which I hung up a fine deer in the morning, and left it during the day. The carrion crows did not find it, but four turkey-buzzards did, and ate up all the viscera that I had left on the ground near the deer; and as they were standing around on the ground near the carcass, but had not touched it, I then again I have known the carrion crow to find a deer as soon as the hunter had hung and left it, and to entirely ruin it in a very short time. My experience is, then, that the carrion crow is fonder of freshly-killed meat than the turkey-buzzard, is a very much more bold and active bird, and will destroy freshly-killed game hung in the woods, while the turkey-buzzard does not generally do this.

These two birds are very readily distinguished the one from the other when in flight together, and they feed together here and everywhere in the South in great numbers on carcasses of large animals. The "crow" has considerably the shorter, wider wings, shorter body and tail, the last looking as if cut square off, and his motions in flight much quicker and stronger. His flight when traveling is exactly the same as the white chicken or wild turkey, namely a quick, strong stroke of the wings, and then a sail or soar, and this repeated. But Dr. Coues is wrong when he speaks of "this species never sailing for any distance without flapping its wings." I admit that this is its general mode of flight. But, during the forenoon of this day, I flushed fifty or more from the carcass of a dead horse, when they all flew out over the treetops, where they began the regular buzzard sailing, and went up to a great height without flapping the wings, and on the river bottoms with no more flapping than the turkey-buzzard.

How the vultures find their food seems to be as hard a question to determine as how they can sustain a flight of hours up and down against, with, or sideways to the wind, gradually ascending an inclined plane for a great distance without a visible motion of the wing. Here are two mysteries that the "longest head" has been unable to explain. How they find their food is fully as mysterious. It has been conclusively proven, I think, that the turkey-buzzard does not find its food by scent. I say conclusively proven. But then, again, when one comes to study the carrion crow and how it finds its food, he is all at sea again, for it does not sail nor soar around high above the ground hunting like the turkey-buzzard so that it may see its food. How it does find it, is more than I can tell, and the more I observe the more I seem to be won to the opinion that it is by sight.

I will explain, and in doing so, will name another observed curious difference in these two birds. The carrion crow is reported as having been seen as far North as Massachusetts and even Maine, but I never observed it so far North as Northern Illinois, during near half century's residence there. If it ever reaches so far North in the interior it must be of very rare occurrence. The turkey-buzzard is a regular summer visitor here, and some breeds, like *atratus*, is much the harder bird. By this I mean that he is active in our coldest weather, at least the coldest weather that I have seen here in two winters, while *aura* is not. Now I suggest to the point I wish to make. From observation made during the past summer I had concluded that *aura* first found the food, and *atratus* followed him up, but this view has been entirely overthrown by recent occurrences. On the morning of the 17th of January, '93, I found one of my horses dead in the stable, and on the morning of the 18th, one of the coldest mornings I have seen in this State, ice just strong enough on shallow pools to hold a man—I had him bauld out into a ravine. No buzzards or crows came to the carcass that day. The next forenoon, about 10 o'clock, the weather still being cold, three carrion crows came flying directly west from the

river bottom, just over the tree tops, directly toward the dead horse, and alighted in the trees, almost directly over it. The wind at the time was steady west of north. In less than an hour after the appearance of the first three *atratus*, there were more than fifty around the carcass. I observed a great many of them arrive, and all came in just as the first three did. No *aura* among them. The next day there were about 100 *atratus* about the dead horse, but no *aura*, nor did I observe a single one near it until the fifth day, when in the afternoon, the weather having become quite warm, several arrived. These facts, of course, upset all my theories as to *aura* first finding the food, following him up. Now will someone please tell me how these carrion crows in their hiding places, perhaps miles away, knew that this dead horse was ready for them in a steep ravine hidden by underbrush, and great trees overhead, and what directed them so that they could come flying directly across the wind, and at once alight directly above it? I think it would be much easier to explain the sailing or soaring of the turkey-buzzard or the swift movement of the vulture than that these carrion crows, and to how these birds find their food, has proven untenable, and would not hold water when the test of facts was applied.

As I said before, the most careful experiments of cool-headed scientists and naturalists have proven conclusively that these vultures do not find their food by their powers of scent or smell, and what is still more strange, my own observed facts have proven to me just as conclusively that they do not find their food by their eyesight or powers of vision. I picked up a theory the past summer, and hugged it and petted it with great enthusiasm for quite a time, but it proved as untenable as all the others when tried by the test of solid observed facts. It was this: That dead animal matter had a stream of particles flowing from it which was plainly visible to the eye of these birds. This theory filled the bill for quite a time. But, bless your soul, after observing two or three seemingly very hungry vultures sit around on a tree for two or three days within a few feet of a putrid rabbit, which was completely covered from sight, without finding it, I concluded that neither the vapor, or fog, or sight, or scent theories would do to tie to. Here, then, in this family of vultures we have two problems over which our most observing naturalists stumble, namely, their flight—which is truly mechanical and should be explainable—and how they find their food, which is truly wonderful. But is it more so than the coming pigeon? or the honey bee? or the homing sucking dove? or the cuckoo?

The descriptions in the first part of this paper were taken from fresh adult specimens of each species. I found them to coincide nearly exactly with the description by Dr. Coues, except as noted. I found the carrion crow a very hard bird to kill with shot; much more so than the turkey-buzzard. They were "collected" purely in the interest of science, and if I can be forgiven I will surely not kill any more.

CROCKETT'S BLUFF, ARKANSAS, JAN. 21.

## THE BOTTOM OF THE SEA.

BY A. E. VERRILL.

THROUGHOUT the Gulf Stream bottom examined by the Fish Commission, the bottom in 50 to 500 fathoms, 60 to 150 miles from the shore, is composed mainly of very fine sand, largely quartz, with greenish feldspar, mica, and magnetite, etc.; with it there is always a considerable percentage of shells of *Foraminifera* of many kinds, but especially *Globigerina*, with other calcareous organisms, and also many spherical, red-like and stellate sand-covered *Rhizopods*, and many large and singular worm-tubes of several kinds, and often in large quantities. In the deeper localities there is usually more or less genuine mud, or clay, but this is often almost entirely absent, even in 300 to 500 fathoms. The sand, however, is often so fine as to resemble mud, and is frequently so reported, when the preliminary soundings are made and recorded. In many instances, even in our deepest dredgings (over 700 fathoms), and throughout the belt examined, we have taken numerous pebbles and small rounded boulders of all sizes up to several pounds in weight, consisting of granite, syenite, micaceous, etc. These are somewhat abundant, and covered with acorn-like, etc. Probably these have been floated out to this region within a few years, while frozen into the ice, in winter and spring, from our shores and rivers, and finally dropped where the ice melts rapidly under the influence of the warmer Gulf Stream water in this region. Possibly much of the sand, especially the coarser portions, may have been transported by the same agency. Another way, hitherto overlooked, in which much of the sand and gravel, and long distances is by reason of its floating on the surface of the water after it has been exposed to the air on the beaches and dried. The rising tide always carries off a certain amount of fine dry sand floating in this way. In our surface towing-net, made of fine muslin, we always take more or less fine silicious sand, which evidently was floating on the surface, even at considerable distances from the shore. When we consider the vast stretch of sand beaches from Cape Cod to Florida, there seems to be an inexhaustible supply of such sand.

The prevalence of fine sand along the Gulf Stream slope in this region, and the remarkable absence of actual mud or clay deposits, indicate that there is here, at the bottom, sufficient current to prevent, for the most part, the deposition of fine clay like sediments over the upper portion of the slope in 50 to 150 fathoms. The upper currents are probably carried along the bottom, eventually sinking to the bottom depths nearer the base of the slope or beyond in the ocean basin itself where the currents are less active. It is probable that such a movement of the water may be due to tidal currents quite as much as to the actual northward flow of the Gulf Stream, which is here slow, even at the surface. It is not probable, however, that the bottom currents are strong enough to move even the fine sand after it has once actually reached the bottom at strong bottom currents. My view of the general deposition of oceanic *Foraminifera*, *pteropods*, etc. I have above suggested that the loose nodules of limestone may have been derived from softer rocks or unconsolidated materials by the removal or wearing away of the latter. The existence of actual currents sufficient for such erosion is hardly supposable. I believe, however, that such a result may be due directly to the habits of certain fishes and crustaceans in these bottom regions. Many fishes like the hake (*Phycis*) of which two species are common here, have the habit of rooting in the mud, like pigs, for their food, which consists largely of marine worms and other mud-dwelling creatures. Other fishes, those with sharp tails especially, burrow actively into mud or sand, tail first. In all probability *Macrurus*, so abundant in this

region, has this habit. Several species of eels and eel-like fishes are very abundant on these bottom regions. These are all active burrowers. The slime-eel or hag (*Myxine*) was also taken in large numbers. Many crabs and bivalve forms are also burrowers. Such creatures, by stirring up the bottom sediments continually, would give the currents a chance to carry away the finer and lighter materials, leaving the coarser behind.

In many localities in the region under consideration there are great quantities of dead shells, both broken and entire. A small proportion of the bivalves have been drilled by carnivorous gastropods, but there are large numbers that show no injury whatever. There is no doubt that these have, for the most part, served as food for the starfishes, so abundant on these grounds, and from which I have often taken entire shells of many kinds, including *pteropods*. Many fishes, like the cod, haddock, hake, etc., have the habit of swallowing shells entire, and after digesting the contents they discharge the unaltered shells, and such shells abound here. The broken shells have probably been extensively preyed upon by the larger crabs and other crustaceans. The large crabs, belonging to the genera *Cancer* and *Geryon*, and the large hermit crabs abundant in this region have strength sufficient to break most of the bivalve shells. Although I have often seen such crustacea break open bivalves for food, I am well aware that they also feed on other things. Many fishes that feed on mollusca also break the shells before swallowing them, or that both fishes and crabs have doubtless helped to accumulate the broken shells that are so often scattered abundantly over the bottom, both in deep and in shallow water. A small devilfish (*Oetopus bairdii*) which is common in this region, also has the habit of feeding upon bivalve shells. Two other devilfishes, (*Eledone* and *Allopius*) of much larger size, are occasionally taken. The *Allopius* grows to the length of three feet or more, with a weight of twenty or thirty pounds.

At several localities, but especially in 234, 351, and 640 fathoms, respectively, we dredged fragments and nodular masses or concretions of a peculiar limestone, evidently of deep sea origin, and doubtless formed at or near the places where it was obtained. These specimens varied in size from a few inches in diameter up to one irregular nodular or concretionary mass, taken at station No. 1,124, in 640 fathoms, which was 29 inches long, 14 broad, and 6 thick, with all parts well rounded. This probably weighed 60 pounds or more. The masses differ much in appearance, color, texture, and fineness of grain, but they are all composed of grains of silicious sand, often very fine, cemented by more or less abundant calcareous matter. In some the grains of sand are large enough to be easily seen by the naked eye, and small quartz pebbles often occur in them, but in others the sand-grains are so fine that a microscopic examination is needed to distinguish them. These fine-grained varieties of the rock are often exceedingly compact, heavy, hard and tough, usually grayish or greenish in color. They usually weather brown, from the presence of iron, (probably as carbonate). The inclosed sand consists mainly of rounded grains of quartz, with some feldspar, mica, garnet and magnetite. It is like the loose sand dredged from the bottom in the same region. The coloring comes mainly from the iron. The masses derived mainly from the minute shells of *Foraminifera* abundantly disseminated through the sand, just as we find the recent *Foraminifera* (*Globigerina*, etc.) in the same region. In some cases I was able to identify distinct casts of *Foraminifera* in the rock. In some pieces of the rock distinct fossil shells were found, apparently of recent species (*Asarte*, etc.). The larger masses appear to have been originally concretions in a softer deposit which has been more or less worn away, the nodules and nodules so that the nodules are picked them up. The age of these rocks may, however, be as great as the pleistocene, or even the pliocene, so far as the evidence goes. Moreover, it is probable that they belong to a part of the same formation as the masses of fossiliferous sandy limestone and calcareous sandstone often brought up by the Gloucester fishermen from deep water on all the fishing banks from Georges to the Grand Bank, as described by me before. No rocks of this character have ever been found on the dry land of this coast.—*Times*.

## MAINE WINTER NOTES.

THE pine grosbeaks came to us in November, which is earlier than usual. They have stripped the apple trees of what fruit was left on them, not eating the apples but tearing them to pieces to get the seeds, leaving the snow under the trees covered with pumice. As my trees had been stripped clean by the children, and some apples into the branches, hoping to bait the birds into the yard, but they did not come. I also tied some open lace bags filled with hemp and canary seed, also some beef bones with meat on them; and it did not take long for the chickadees to find them. A few days later came a couple of sparrows, which I have no doubt are our ground sparrows; they have the flecked breast with a black spot in the center. For some reason they were left behind their companions in the autumn. Then came another bird, because of its little and of which I do not know the name, but take it to be a visitor from the North. Only one came at first, then two, and now a dozen; so I have put out a box of chaff, open at the side, and every day I throw into it a handful of meal and some hemp and canary seed, and they board with me regularly now. We all enjoy their presence very much. This morning I found one of the strange birds in the snow dead. They were the same birds of wintered birds, but I cannot conceive what killed it, certainly not the cold. It might have dived against the house. I took it into the house, and my little girl pleaded for it for a funeral, but I thought I would like to know the name of it, so I send it to you. Please name it.

Do English sparrows migrate? A few years ago, wishing to have some birds here which would stay with us winters, I introduced a few English sparrows from England, putting up bird houses in the trees for them. This was in the spring, I never saw them enter a house, and during the summer they disappeared. I am very sure; not one can be found within miles of here during the summer, but every year, about November, a flock of about twenty make their appearance and winter with us. They pick up their living about the grist mills, and go, no one knows where, in the spring. These are the kind of sparrows we have. They stay with us and help make our winter so happy in the winter, and go away in the spring and let better birds come. This is not an advertisement, as I have no eggs to sell; but I am very sure in my statement, the English sparrows winter with us, and not one can be found here in the summer.

The last one of my three young quail died late in Novem-

ber. I have three old ones in the same piano box, with glass windows laid on top; they are healthy, and don't seem to mind the cold. JAMES WRIGHT.  
[The bird is a tree sparrow (*Spizella monticola*).]

**SNIPES WINTERING IN COLORADO.**—Fort Lyon, Colorado, Feb. 3, 1888.—A soldier brought me to-day a true snipe (*Gallinago yellowi*) and stated it was in company with another. It was a male, in very fine condition. Size, average. Gizzard contained partly digested fish. In one of them (about one-fourth of an inch long) the eyes and tail could be plainly seen by the aid of a good lens. The bird seemed more lively than usual. I have skinned and stuffed him. He was shot at a spot where a small underground stream issues from the sand and the water does not freeze. It would seem an unlikely place to find snipe at any season, being perfectly barren—all sand and small stones. The ground here has been frozen solid for two weeks. No rain since last July. Severe northern with snow for the three days previous to this; temperature last night, 22 below. As all the wintering of snipe North of which I have heard described them as being found in sheltered, springy places, I thought the fact of their being found in winter in this bleak, barren country might be of interest. It is also, to me, a surprise to learn that Wilson's snipe sometimes goes a fishing. I would like to know if this fish diet is adopted from necessity, or if the bird ever eats fish when it can be in the ground?—L. C.

**PINE GROSBREASTS IN NEW YORK.**—Lockport, Niagara Co., N. Y., Feb. 3.—In your issue of this week I noticed Harry De B. Page's mention of pine grosbeaks in New Jersey. Last Sunday while taking an after-dinner stroll in the western part of the city, I noticed a flock of birds in an evergreen a few rods from the street. I approached within less than two rods of them and watched them for some minutes while they were feeding. I came to the conclusion that they must have been pine grosbeak, although I had never seen but one specimen before, which was secured by a young friend some years ago, and the only one I ever knew of being taken here. On Monday, after banking hours, I took my gun and went to the same place, and found the birds within twenty rods of where I saw them the day before. I went among them with a light charge of No. 12 shot, and secured four of them, one male and three female. My son has stuffed and mounted them in different positions, as I saw them while feeding, and they make a fine addition to his collection.—J. L. D.

**OPSSUMS ON LONG ISLAND.**—We were shown this week an opsum which was killed at Wading River, Suffolk county, L. I., on the fifth of February last, by a dog belonging to Mr. L. C. Valentine.

**"WHEN THEY COME AND WHY."**—In sixth line of the paragraph upon the head, page 11, for "four or five years" read "forty-five years."

## MINNESOTA SENATE RESOLUTIONS.

**U**NDER date of February 8, comes the following dispatch from St. Paul, of the proceedings in the Minnesota Senate relative to the seizure of the Yellowstone National Park:

In the Senate to-day Mr. Wilson offered a concurrent resolution reciting the attempt of a party of capitalists to secure control of the Yellowstone National Park, and the warning of Gen. Sheridan and Senator Vest upon the topic, and requesting that the Senators and Representatives of Minnesota in Congress use their influence to secure this Park for the public good, free from the extortions of monopolists. The resolution also thanked Gen. Sheridan and Senator Vest for their timely efforts to prevent the securing of the Park for a cattle ranch and for the purpose of extorting money from the general public. The resolution is a copy of one passed by the Legislature of Illinois. Some inquiry was made as to the certainty of the charges, which Senator Wilson stated was a matter of general report.

Senator Peck remarked that the matter had been before Congress and the people for thirty days. In Senator Vest's resolution the matter was fully explained and wisely published at the time. Senator Gilliland moved to refer the resolution to the Committee on Federal Relations. He held that the Senate would show unbecomingly haste in adopting a resolution upon insufficient knowledge. The yeas and nays were called for on Senator Gilliland's motion to refer, and the motion was lost by a vote of 20 to 2. Mr. Gilliland gave notice of debate. Objection was made by one Senator to the words "cattle ranch," and Senator Wilson erased them.

## THE SEVEN-LEAGUE BOOTS.

**I** CAME yesterday into possession of the Seven-League Boots. How this rare good fortune was attained need not be detailed; but I beg to assure you it was no such infernal compact as that by which the unhappy Peter Schlemihl won the same wondrous leathers.

Sitting in my easy chair before the grate last evening, impatient to test their magic, I pulled on the Boots. Of what wonder I shall not attempt to give more than the barest of time. Hardly were my feet fairly enmeshed in the leathers before I found myself two thousand miles away to the North, amid the howls of the Arctic, blazing the reindeer with Lieut. Schwatka and his faithful Tooleahs. The change in temperature was, as you may well conceive, something tremendous, but partly because of the excitement of my novel position and the exhilaration of the chase, and partly because of certain properties of the Boots, I felt it not. With barely time to count the Lieutenant's gun, I was whisked away another two thousand miles, and as quickly the reindeer, in company with "Seneca" putting up and bracing down the bow, whirled in an out-of-the-way spot in Western New York. But only for a moment—for quick as comes and goes the buck's flank in the opening of the brush, I passed twelve hundred miles to the South, and with Dr. Henshall explored the borders of the Everglades, where I was as much interested in the sweltering Seminoles as but a few minutes before in the frozen Esquimaux three thousand miles away.

From southern Florida it was but a bagatelle of fifteen hundred miles to the Maine woods. Thence to the London Aqueduct, three thousand miles, and a like distance down to New Hampshire. With the speed of lightning I was transported to—but, my dear Forest and Stream, you must long before this have perceived that I have been all this time sitting here in my comfortable chair, before the fire, reading the pages of your last number, which came in my mail yesterday. Neither you nor I would be so bold as to declare the Boots themselves a myth, though I confess for myself that I never expect to wear them; but do you know I really don't care much for them, so long as, sitting in my chair, I can travel the world over with such a companion as yourself. MRS. HAWK.

## Game Bag and Gun.

To insure prompt attention, communications should be addressed to the Forest and Stream Publishing Co., and not to individuals, in whose absence from the office matters of importance are liable to delay.

## RUNNING FOR LIFE.

**I**T WAS three o'clock of a starlight morning in November, 1846, that I mounted as fleet a filly of four years old as I ever rode. I was to go down the river fifteen miles on an errand and to be back before breakfast. My father had a large farm, and I was the chore boy for all; so I was always at home in the saddle.

I had to pass through a thick hemlock growth of about four miles without a clearing. Soon after entering the woods I was thrown forward on the neck of the colt, and she snorted and made an effort to turn. I looked ahead and discovered what I supposed to be a large dog. I was vexed with the pony to think she should be afraid of a dog, so I struck her with the stick, and she bounded by with a leap that would have made me much more used to riding; and as I passed the creature it leaped toward me and grazed the colt on the hip. That made her about as frightened as it did me, for I then discovered that the animal was a very large catamount. The pony flew like the wind; and as I recovered from my first fright I looked over my shoulder and found the creature was right after me. My knowledge of the panther's habits, furnished by the old hunters of that day, was all correct in a moment. I thought if I could keep the colt at the distance now gained I might outwind the panther, but I had no experience to tell how long she might follow.

The filly hurred the ground and flew like the wind. Every moment I looked back to see if the creature was gaining on me; but I found I was holding my own. The time I passed over that forest was my much more than I need to wait, although it seemed an age. I had been chased a lot of wolves one dark night through a piece of thick hemlock timber in another part of Oxford county, and the filly had come out all right, although I came near being left; but this was quite another kind of beast. The first three miles it was about nip and tuck, but as we neared the first clearing I found I was gaining on the panther, and I began to take courage. The colt still hurred, and I was now riding with a rattled behind her like hail; and still we flew on, with the panther in the rear. While I was thinking over what I should do if she still continued to follow, I came to the clearing on which was a log house; but I knew it would be useless to stop there, so I rode up mind to keep on; and as I passed the house I looked back, and the panther had turned off in the woods, perhaps thinking that I was not good meat.

I did not go back as soon as I had intended; but when I did return I measured the track and found the leaps, which averaged twenty feet. The creature was shot a few days after by a man named Spencer, in the town of Baldwin, Oxford county, and I measured it. It was just nine feet from tip to tip. I think that it was the largest panther there is any history of being killed in that State.

S. P. HENRIARD, M. D.

TACONOT, MASS.

## FREEDMAN vs. BOB WHITE.

**I**T IS funny to me that your correspondents, after telling you of the almost universal scarcity of partridges, should inform you the negro is in no wise responsible for that scarcity, because, forsooth, he has lost all fondness for hunting. I wonder it does not occur to these gentlemen that the sable Nimrods have given up the sport to wherever it may be for the simple reason—"It don't pay." It gives them no more pleasure than it does us to carry a gun all day long, and come home with an empty bag. In autumn, for weeks together, negroes, by scores and hundreds, go out every night in fresh tide-water marshes after sora, which they kill in great numbers by torchlight; and this they did in the time of their slavery, and they had to do so now; now they are out all night if they choose, and sleep during the day. And old Virginia, at this very time, would be a possum paradise, but for the nocturnal darkey, who would not swap a big fat possum for all the curvass-backs of the Chesapeake.

No doubt Dr. Elzey speaks correctly, for the part of Virginia with which he is acquainted is the grazing section of the State. But I apprehend he knows very little of the system of farming, the physical condition of the country, or of the habits of the negroes in tide-water Virginia. In the counties of King William, New Kent and Charles City, extending from the Mattaponi south to James River, farming is not done so carefully as before the war, but it is exactly the farming partridges delight in. Hedge-rows, ditch-banks and springy places all grown up in briars and bushes. Wheat, oats and peas are grown on every plantation that pretends to be cultivated, and the manner of harvesting is the same now as for the past thirty years. There is an abundance of cover and of feed—wheat, oats, peas, Magotha bay-bean, and sometimes millet, but no birds. Whereas, for several years after the war, the whole low country was alive with Bob White, notwithstanding there was not so much of small grain then as now, nor thurality of peas and the bay-bean, a spontaneous growth in lower Virginia, highly esteemed by birds and supplying excellent cover.

If Dr. Elzey would only make one visit to these counties he would never again in his description of the general condition of Virginia talk about "the thicker settling of the country, and clearing of forests and swamps and brushlands;" for the reverse is exactly true in every particular as to nearly every part of tide-water Virginia, away from the cities of Norfolk, Hampton and Suffolk. The second day of Christmas, 1882, three deer were distributed at King William C. H. among the huntsmen. Deer are not fond of a thickly settled country where forests, swamps, etc., are cleared up; yet they are largely on the increase in all the counties I have named. And to-day I believe King William county is the best ground in the whole State for partridges, taking climate, soil, water, cover and forage together. Still I know of but one farm in the county which affords good sport, and that is owned by a gentleman who does not allow hunting or trapping by his tenants.

In the country of which I am writing, most of the negroes, who are heads of families, like to rent a piece of land with a cabin on it, so as to raise a family and to grow corn. They, with their wives and children, raise a crop of corn and such vegetables as grow without much attention; but

not one of them will hit a lick, Saturday, in his own crop. For their meat they depend on hunting, trapping and fishing, although they are always glad to sell what they catch (except "possums"), the money being used to buy the grocery; and it is remarkable how little they eat when they have their own food to find. For money they rely on wood-chopping, loading vessels, working at saw-mills and in the harvest field, and gathering the crops of corn on the large farms. In this way they handle more money than those who hire themselves to farmers by the year, although they are so well paid. What a Christmas comes, because so much of their time has been spent leading around the grocery; and "there's where the money goes." But the negro is going to hunt small game till the crack of doom, if the small game will only abide with us. He never goes for large game.

So I stand to my text that the partridge has been well-nigh exterminated by the ever active, eager, ingenious destructiveness of man. What has become of the bison on the sunrise side of the Mississippi? Done to death by the fur hunter. And why are we propagating fish artificially? Let seines and gill-nets and fyke-nets and purse-nets and pound-nets and guano manufacturers answer.

RALLTWOOD.

YONKOTA, February 8, 1888.

[In issue of Feb. 1, article entitled "The Negroes and the Birds," last line on page 7, for "destructive as a sportsman" read "destructive as a city sportsman."]

## IMPROVED SHOTGUN SHELLS.

**D**URING the past year the English sportsman has been investigating the merits of a shotgun shell recently placed on the market under the name of "Kynoch's Perfect Case." This shell is composed of very thin and flexible brass in order that when loaded the end may be closed to retain the charge as in paper shells. The shells are, of course, waterproof, but as regards shooting do not appear to have any special advantage over paper shells shot in the same gun; that is to say, there is very little difference either in pattern or penetration between a 12-gauge Kynoch and a 12-gauge paper shell each charged with the same load. Continued and careful experiment, however, brought to light the fact that a 14-gauge Kynoch shot in a 12-gauge gun gave much better results than a 12-gauge paper shell in the same conditions. To shoot a 14-gauge K. in a 12-bore gun necessitates bushing the chamber, the barrel, or obtaining a new pair of barrels specially chambered for the 14-gauge Kynoch. When this is done there is little doubt that greatly improved shooting results, as careful trials by the editor of the London Field, by Mr. Greener and others testify. Our British cousin is now trying to make up his mind whether he will have his barrels altered or new ones made, or whether to stick to his old barrels and paper shells. We make these statements in view of the fact that we have recently had an opportunity of examining an American invention which promises to more fully meet the requirements of sportsmen than does the Kynoch. Theoretically the shooting should be as good, if not better, than that of the English shell, and it can be used in guns chambered in any manner. It appears to possess the principal advantages of the brass and paper shells without their special defects. It is reliable, waterproof, tight, capable of being crimped, but slightly more expensive than the paper shell, and probably not more than one-fourth the price of the ordinary brass shell. We hope at an early day to be able to give full details concerning it. The improved shell is the invention of our occasional contributor, "H. G. P."

## ADIRONDACK WINTER NOTES.

**A** FEW days ago I met one of our best still-hunters, who, in five days last fall, had killed nine deer.

"How many did you and the boys kill with the dogs?"  
"We hunted ten days," he replied, "and got one big buck and two does. The buck I killed on the runway; he had got by all the other boys and was making for the swamp; we had run him three or four different times, and he always got away, but I smoked him."

"Then you did better still-hunting than with the dogs?"  
"Yes, I can kill five to one, when the snow is good. But the deer are wild this season; they have been dogged so much. I wish every dog was dead—no, I don't, either. We guides get lots of days' work that we would not get if we did not hunt with dogs, and if we did not hunt with dogs very few people who come from the cities would ever see a deer."

"That is so, and don't you think that the dogs are a protection to the deer in this way, that they make the deer harder for the still-hunters to get up to?"

"Yes; I used to kill ten deer where I do one now, and I have to work harder every year to get up to them. Four is the most I ever killed in one day. Bill Danforth says he has killed seven in one day. I have known of his killing five in a day, but he has been out a number of days this season, and the last time I heard from him he had not killed a single one. He says he never saw them so wild."

"Do you think the deer are growing scarce about here?"

"No; I never saw the deer signs so thick as I did the day I was in back of your house, where I killed the two bucks. I could have started a dozen deer that day. No; I think the deer are on the increase every year."

"Do you think the dogs by running deer worry them so many of them die after the dogs leave them?"

"No; I never found but one that I thought would have died. I found him in the ice where he could not have got out, and I killed him and took him home to save his life!"

I have given this conversation just as it took place, showing the opinion of one of the best of our hunters as to how the deer are on the increase every year. The still-hunters last fall; they all complained that the deer were wild; there were lots of them, but they were hard to get up to.

I have read much about bears in the Forest and Stream during the season, and have one little story that has not been told in print. About the first of last year, "Lime" De Bar set a trap at Hayes Brook to catch a muskrat. His first day's work was a three-mile tramp to his bait, and he had to walk five miles with a trap of twenty pounds, and meat twenty-five more. One week from that day he visited his bait and found the trap gone, with good signs of bear. He followed the trail about one mile and found the trap by the side of a stump—a "little hair, no bear."

"Lime" is naturally of a thoughtful turn of mind; so he sat down to study the signs, and satisfied himself as to how the bear would get up to the bait. He went back an hour, then he picked up the trap and went back to the "cubby house" to set the trap again, and found that the bear had

been in while he was gone, and had eaten up all his bait. "Limo" was mad. He came to the house, got some more bait and another trap, and went back, vowing to have that bear if it took all summer. He visited the traps in a few days, and found a hedgehog in each; took them out and added them to the pile of bait. The next time he found a rabbit in one and a woodchuck in the other. He went a few days after and found another "quill pig." We then began to laugh at him; but "Limo" was bound to have the bear.

July 1, he came in to celebrate, and to help pass the time, visited the traps, and found nothing disturbed. So he went fishing down the brook, and was gone about three hours. On his way to the house, when about half a mile from the trap, he heard a noise. He said "he knew there was a bear in the trap, or two bears fighting near where the trap was." He threw off his pack and ran. When he came in sight of the traps, he said he could see the old fellow moving the sliders with the trap, and roaring every time he struck; but "Limo" could not get a shot at him. "But," says he, "when the bear snuff me, he started, and I after him; and he ran more than a mile before I got a shot at him; then I got in one, and he turned, and I had to dance to keep out of the way; but I got in another shot and settled him." "Limo," then, had a four-hundred pound bear five miles from the house, and it was five o'clock in the afternoon. He took the sliders out and came to the house, and went back the next day for the meat. The skin was not of much value, as the hair was thin, but it was a very large one. It was a great deal of labor for a little bear, but he had the satisfaction of beating the bears at last. He killed two, later in the season, that were good.

As I write, the thermometer says sixteen below zero. Our snow still accumulates, and there is no let up to the cold. It has been a long, steady pull. The winter birds have gone South, or somewhere else. We have heard a owl since snow came; no crossbills or jays. One white-throated sparrow got left in some way, and stays around the barn and woodshed. I fixed a hole for him to get into the barn, where I gave him corn meal. He has become quite tame, and I hope to keep him till spring. The cat got after a skunk under the kitchen. Result—he cat stays out of doors nights, and we had to abandon the kitchen. I afterwards "night-hunted" the animal with the cat, and shot the varmint, the only one I ever saw here.

A. R. FULLER.

MEACHAM LAKE, Jan. 24, 1883.

#### DUCKING ON JULINGTON CREEK.

FIFTEEN miles south of Jacksonville, Julington Creek enters the St. Johns River from the west. Three miles from its mouth it forks and the prongs extend several miles out in the direction of the sea. As it has not been advertised as the "paradise for sportsmen," the shooting is pretty good.

G. was staying with us for a fortnight after making a tour of the States. G. is an Englishman, but not aggressively so. B. suggested we go on a camp up Julington. The place is called Ever-Blue, a thirty-five foot sloop named to distinguish her from a rival craft at the Ever-Blue. Whatever the Ever-Blue's qualities were on the wind, it was generally conceded that she was lightning with her sheets started; and she fully sustained her reputation that day. We had no ballast unless we so count Point, a setter, supposed, at that time, to be a terror to wild turkeys. His merits have been extolled since. As ballast he was not such a success. The boat was so much, he was unable to maintain a position on the weather side, and eventually settled himself in the lee scuppers, close by the demijohn whence nothing could move him.

The wind blew a gale, and as we had points for only one reef, it was very nice work sailing. Finally we got a "slant" for the mouth of the creek, and we fairly flew. It required both B. and myself at the helm to hold her to it.

The mouth of the creek, which is over a mile wide, we ran fast, a flock of scamp or raft ducks, and knocked over a couple, B. dropping astern in the "dugout" to pick them up.

G. was in the bow tending big and watching for shots, and the boat fairly ran away with me. Twice she missed stays because she was so light by the head, and I could not handle both sheet and tiller quick enough. We ran through a flock of ducks, and G. dropped three, but I could not stop. At last with a gasp, and a slight lull of the wind, we got out about and ran back, and having picked up B., who had lost his birds, we ran on again to where G. had knocked down his three, and secured two of them.

Then we came to anchor and had a "cold snack." After washing our lunch down with diluted water, we "up jib" and start up the creek.

At a point called the "Lily Pads," which is the beginning of an immense stretch of floating water lilies and water lilies, we have too. Large flocks of ducks and coots were flying about or settling in the open spaces among the lilies. All of them were very wild.

One came along flying high, distant about sixty yards. B. let drive with his ten-bore choke, No. 5 shot. The duck's head and wings dropped and he seemed to hang suspended for a second in mid-air, then down he came, stone dead.

After killing a few more we sailed on up the creek, being anxious to get to "Blue Bluff Landing," our usual camping spot, before dark. The banks of the creek were most beautiful. I think our Southern autumn is finer than the Northern. The colors are not so strong. There is more gray and brown here, principally on account of the Spanish moss, which falls from every limb and branch. Still there are plenty of bright tints.

We arrived at camp in good time and soon had a roaring "lightwood" fire going, and hauling some coals out on the windward side we prepared our supper. After supper we lighted our pipes and fell to telling stories, that chief of delights around a camp-fire, and before we turned in we all agreed to meet in California in the spring of '84 when G. comes through from his way home from India.

That night as I lay on my rug, watching the full moon nearly overhead, I heard the familiar sound of flying ducks, and a flock passed across the face of the moon, and the whistle of their wings grew fainter and fainter, and the howl-hon of the owl grew more and more distant, and the camp-fire flickered lower and lower—and I was asleep.

We were up by break of day and took the dugout to try the open spots of water among the water lettuce. On our way we found geese, and a single high over our heads, the first we have ever seen in the creek.

We found ducks and coots plentiful, but very wild. B. got a blue-winged teal which was the only other variety of

duck beside the stamp—save one scattering butterball, which last nearly caused B. to capsize the dugout in the frantic attempts he made to grab his bird before it dived. The dugout was very cranky and leaked badly. Standing up in it was almost an impossibility, and our only means of navigation was one poor worm-eaten paddle, which we took turns in using.

We had good sport with the ducks, but took no notice of the thousands of coots, as they were entirely too easily killed to furnish any sport. Finally we started sailing down on the different flocks that floated near the mouth of the creek, and we obtained some good shots. On our way home we stopped to interview H., at the entrance of the creek. H. has built himself a very neat domicile, and named the place "Orthodox Point," for reasons it would be inconvenient to explain. H. was absent, so hanging a pair of ducks on the porch out of the reach of Major, his setter, we attached a note written with a cartridge for want of a pencil, and steered for home, where we arrived in time for a roast duck dinner.

We got considerable shooting about here and collect some fine specimens of herons, and have obtained several specimens of the purple gallinule. There are more ducks this winter than I ever knew before.

MANSBART, Fla., Jan. 10, 1883.

#### "A LONG PULL, AND A STRONG PULL."

WE were at City Point, Va. It was the 23d of December, fog, fog, fog! So thick you could taste it. Over everything and everywhere. "Now look here, Brunt, we must reach home for Christmas!" "You's best tak de Old Dominyn fur Richmond, boss," put in an old dapper patriarch, "dat de surest." "When is she due here, Uncle?" "Dunno, sah; she may be bout four leet, kep by de fog, I reckon." "I say, Brunt, we will have to make a start for Petersburg. That's the only chance. If we make the train from there, all right; if not, we are stuck, and that, my friend, is just about the size of it. Any horses in town, Uncle?" "You see dat white gemman on de wharf? Dis a way, dar he, tall gemman in de big hat, he de only man what keep a boss, I reckon he kin tak you over."

We proceeded to interview the tall gentleman, in the big hat. "Can you take us over to Petersburg for the 3:25 train north?" "Waal, I can't tote you myself; and my boy, he's gone to cut a Christmas tree, ef you mind to wait for him, I'll send you over" (emphasizing the send). "When will he be back?" "About two hours, I reckon," (glancing at his watch, a huge affair, with an immense fob strung to it, a decoration which finely set off his slovenly attire and cowhide boots, with trousers tucked in their tops). "Too late for us. 'You won't go yourself, then?' "That, I believe, was the remark I made, stranger."

The old uncle came to the rescue again: "You's best take a boat, boss, and row to Petersburg by de ribber, twelve mile. Hyar, Buck, hyar, Buck, cum an' range wid de gemman to take 'em to Petersburg wid your boat." Buck approached, and a fine, sturdy fellow he looked. He could row us to the Blue, you all agree. Well, I mus' have sum one to go 'long and your wid me." "All right, shake her up and get the boat ready, we will have flood tide most of the way if you are lively." "How much you goin' to pay, boss?" queried Buck, "twill be worth four dollars." "I'll give you five if you get us there by 2:30." "We'll do it, sir, if we can't pull thar in two hours, nobody run' hyar can't."

We weave our luggage to follow us by express, and having secured a bottle of whisky, the best thing in the world to bring the fog out of a darkey, we tumbled in and are off, in as dense a fog as ever covered the bosom of the James. Our boys were a team of finely developed lads, with broad backs, superb shoulders, and a long reach, which told wonderfully, as they swung together. The old tub fairly made the water boil as she gathered headway under the powerful stroke of the young athletes. The weather was close and muggy, and I noticed that Brunt perched himself in the bow when we started in an off-hand sort of way, at least I thought so, but as usual there was method in the madness of the long-headed old fellow. As he settled down he snuffed, a deep, meaning smile, and when the fog lifted, and the sun glanced down, lending an additional warmth to the already comfortably warm atmosphere, the smile broadened into a grin, as the steam which arose in clouds from our perspiring bosoms was wafted directly into our faces. Talk of Araby the blest!

"Will you smile, boys?" said Theo. "Yes, sah," said Buck, our stroke. "Hold on Buck," yelled Charlie in the bow, "I dry too, dry as a bone!" "Shet your mouf, nigger, gemman cums fust," retorted Buck as he passed it to Charlie. "Here's a handkerchief to dry your face, boy," said Theo, "keep it, keep it to remember me by." During this pause we took the opportunity to light our cigars, and for the first time since we had started they neutralized to a great extent our discomfort, but how we did smoke!

Leaving the James, we pulled into the Appomattox; and here the surroundings were of great beauty and interest. We were among the scenes of the Peninsula Campaign, and our boys, whose tongues were now loosened, and who were, by the way, bright intelligent fellows, pointed out as we passed along, points of historical interest, among them the fighting spires, which still show their heads above the muddy stream. The Government has, at considerable expense, deepened the channel, and the neat white posts, at from two to three hundred yards apart, bearing the depth in distinct black figures on their faces, looked at us in a stolid indifferent way as we glided past. The "tangle foot" was working at last on Buck, and his fiendish whoops would now and again break the stillness, and his exclamations, such as "I can't only see the bottom of the boat," and "the boys, flung back by the echoes. This stimulated Charlie, and the din was tremendous for a time, as with shouts and laughter they beat to their work, starting the herons, who flapped up as we approached, and labored off with their long legs dangling. Gradually the laughter ceased and the whoops were few. Then Charlie addressed Buck: "Say, nigger, is you hit agin on you bed, for all that appearance, Mr. Ashford, you're bed is very muddy." "You're right," says Buck, "you must excuse me, Mr. Williams, he's gittin' a little off; in fact he ain't doin' no talkin', de black bottle am a speakin' now!" "Shet up! Mr. Ashford, the bottle the response, 'you are not responsible for your akshuns nur your words. Work up! work up! man; dese gemmen hev to catch dat train, don't you forget it.'"

At last we see the spires and chimneys of Petersburg around a bend in the river, and with a long and strong pull we sweep up to the wharf and clamber out, just two hours

and seventeen minutes from City Point, remarkable time, considering the fact that fully half the distance was made against a strong current, which, owing to the swollen state of the river from recent rains, made the task a heavy one. We made our train. And now I must beg "Kingfisher's" pardon, but spring water would not have done it. Without that black bottle the darkeys could not have kept up the pace required of them.

That was a memorable trip, and one among many of the little experiences which fall to the wanderer by forest and stream, and especially to those who find themselves among the ungetaway-fromable places in the sunny South. DICK.

#### SUMMER SHOOTING.

THE recent editorial of FOREST AND STREAM on the "Proposed Maine Summer Shooting" moves me, as a professional man, to ask a few questions, and to suggest another side which possibly the editor overlooks.

It is not difficult to see the force of the argument of those who oppose all summer shooting. If we are to have game the young must be protected, and the open season must not be too long. All that is plain enough. But is it not possible to have some shooting in the vacation season of the year without sacrificing the game or killing the goose that lays the golden egg?

Now, Mr. Editor, of all men in our land it is the brain workers who need the glorious recreations of the woods and fields, with rifle, gun and dog. I am a clergyman and for many years I have been urging my trigger brethren to take to the woods with gun and dog. Many of them are now victims of the strange fascination of the trigger, and if you keep your eyes open you will see the beautiful setter about many a parsonage. The clergyman must close his vacation by the middle of September at the latest, and then comes the tread-mill round of brain work and responsibility for eleven solid months. His only opportunity is the summer shooting.

Another class of equal importance to our civilization is that of college professors and school teachers. Of these there are tens of thousands in the institutions of the land. These all resume work about the middle of September also. The best fishing is in the early summer, and the best shooting is in the fall, but the vacation season unfortunately comes just between these, and there is no encouragement for these professional men to give themselves to a recreation which, like sleep, "knits up the raveled sleeve of care, is balm of hurt minds and chief nourisher in life's feast."

Beside the teachers and the clergy there are thousands of other brain workers. The lawyers, the theatrical profession, architects and artists of all kinds, and the physicians at least of the wealthy classes, all of these find their slackest season in the summer. Editors can get off in November as well as August, and the same, possibly, can be said of a large proportion of the wealthy gentlemen who compose the game clubs, and who are constantly denouncing the use of a gun before October.

Now, is there nothing owed to the above classes? Are no concessions to be made in their behalf?

Many of the States permit grouse shooting in September and woodcock shooting in August, and there seem to be as many of these birds in those States as in others.

What lover of the chase cares to go to the North Woods in the fall, when the chance on the game is so small?

But if you permit any shooting at all the pot-hunters will take advantage and destroy the half-grown game. Yes, undoubtedly some of that will be done; but a considerable experience has convinced me that as a rule men keep to the bird they go for and respect the law.

Something will be sacrificed undoubtedly by summer shooting, but we can estimate the gain that will result from sending the brain workers off into the woods for four or six weeks every year?

Hear the other side, says the proverb, CLERICUS.

#### THE BIG-GUN DUCKERS.

Editor Forest and Stream:

I have gunned in the neighborhood of Havre de Grace, Md., for nearly twenty years, and think I know some of the doings of the big gunners. During all that time it has been the same as at the present, almost an impossible matter to put a stop to these big-gun shooters. For the last four or five years police have been appointed with a salary attached, and for the duties performed the salary was considered sufficient. The policeman in the fall of the year will be seen sailing around the flats looking among the box-boat men, and now and then he does catch one of them on the flats a few moments ahead of the time prescribed by law. The coming of cold weather puts a very different aspect on the picture. You will then find the police sitting around some good warm stove in Havre de Grace. He don't hear any big guns in the night, nor at any time for that matter. He is perfectly conversant with their doings and knows every one of the big-gun men, and he may be related to some of them.

Look down to the wharfs of Havre de Grace. See the craft anchored off the wharves and in the stream. Some contain the box-boats of the licensed gunners. What are these small skiffs we see on some of the craft? Why those are big-gun skiffs. But where is their anchor? Their destructive tubes? Why, bless your innocent heart, that's along the shore somewhere, hid in the bushes waiting to be called for.

There is one thing that seems very strange to me, that is, why the landowners all the way from Spessita Narrows to the Gunpowder River do not make complaint. They have plenty of chances, as the big-gunners are prowling around on the lookout for beds of ducks. When they see a good one they call it, and the gunners come to anchor with their small spool go below, eat supper, and things fixed.

On yonder cove is a large rack of redheads and canvas-backs; they have been there for three or four days. Mr. Big Gun sees them, and he knows by their actions that they will stay over night, or until he gets one shot at them. The sun sets; the shades of darkness fall; nothing is seen but the dim light in the sloop's cabin. Soon there is a shuffle on the deck and a splash is heard; that's the skiff put overboard. Then a low voice says: "Oh, Brin! where the gun at?" "Go along the marsh about fifty yards, and about fifty feet south of the little gum tree you will see it."

Now your correspondent does not say that all the big-guns are hidden to view; some, but not so many, are in the houses of the black men in the vicinity of the shores, and it was once said when I was at Bush River that a big-gun was owned by a club man, and shot in the coves of the very grounds that he rented to a club.

"Well, let's have a shot at them ducks we left in the cove."

Everything is put in readiness in the skiff and away he paddles, with small paddles something like a mush-stick or breast-stick. Two of these are used, one in each hand, while the gunner sits on his stomach. Soon he has reached his starting point on the shore and has things all ready. The ranks of ducks are drawing closer to him; fifty yards, that's near enough. A small pinch of powder on the skiff's gunwale is ignited by a match; this causes the ducks to raise their heads. Away goes the big gun. Down comes Mr. Big Gun's friend from the sloop, and helps pick up the dead ducks. The cripples go away to die along the marsh edges. No difference to B. G. he has killed sixty. This is the modus operandi of most of the big gunners.

I remember upon one occasion that in a cove between the Sutton farm and Eliot's, at the mouth of the Bush River, redheads had traded and bedded for nearly a week without being shot at. One morning Mr. B. G. spied the bonanza. He had his shot. In the morning there were about ten ducks alive in the cove, where the afternoon previous, there had been two or three thousand.

Now I would propose a meeting to be held at either Baltimore or Philadelphia, of the club men and those who pay an annual rental of from \$100 to \$2,000 for the privilege of using these shores. I think an act can be framed and presented before the session is over that will do away with big-guns. Now is the time to act. Spring is upon us, and the coves will be filled with ducks that are in many cases mated. Let us see if we cannot prevent the depreciation of the sport that we have to pay sums for.

The box-batmen at Havre de Grace will join in giving a helping hand, as they are opposed to the big-guns, but from a fellow feeling never complain. The special policeman is satisfied with his salary, and in consequence no complaints from any source ensue.

I would like to hear from all the clubs, from the Sardine on Swan Creek to the Salmon on Gunpowder River.

RAP BASK, N. J.

TEX BOMB.

It should not be supposed the illegal use of swivel guns and the slaughter of fowl in the Spessitia Island section has been carried on for late years only. For twenty-five years it has been known that a big-gun or two was owned and regularly used at night, while the weather would permit near approach to the fowl. Of late, however, the number of these murderous implements has been increased, and the owners becoming more bold in the use of them, it was determined to make a vigorous effort to put a stop to the operations which were known to be in open violation of the law. We are in hopes now that the fowl can resort to their feeding grounds, at night at least, undisturbed, that a visible increase of their numbers will be noticed, and that during the past five years it has been evident that the flocks were greatly decreasing, and those that frequented the Havre de Grace waters were yearly becoming much more shy, doubtless on account of their continual harassing by the swivel guns.

The owners of ducking shores living in our city are jubilant over the success of the late raid against the pot-hunters, and one gentleman made the remark to me yesterday that he would be glad to see the shooting either prohibited or limited to one day in the week instead of three as at present.

HOTO.

## THE AIR-SPACE.

Editor Forest and Stream:

"Bullseye's" communication in your issue of the 4th of January having elicited several notes on the subject mentioned by him, permit me to say, though from the distance from which I write I am necessarily rather late in the day, that to me there does not seem to be the slightest probability of the accident mentioned by him having been occasioned by an air-space, but that it was caused by the use of the blank cartridge. The ordinary Snider (government pattern) blank is not calculated to stand much strain, having a comparatively roughly made brown paper case, which is sufficiently strong for the purpose required, to seal the chamber of the rifle on the explosion of two and a half drams of more or less damaged and weak powder. On a bullet, however, being placed in front of the cartridge, air-space or no, its resistance would commonly increase, the strain of the powder as to the cartridge, and the gas rushing past the metal cartridge head, after bursting through the front paper portion, would no doubt in some cases be sufficiently powerful to blow open the breech, especially in the older pattern Sniders, and cause the damage mentioned by "Bullseye."

I will now mention that I have seen a government pattern military Martini-Henry rifle fired several times with a large air-space, without any ill effects, the strain of the powder as to the rifle, however, was not loaded with a bullet, but had been accidentally plugged up about a foot from the breech with a piece of rag with which it was being wiped out, and which could not be disclosed. To save a visit to the armorer, the owner, a volunteer, took the bullet out of a ball cartridge and spilling all the powder, but half a dram or so, fired it off, with no result, and having a third time, but this time using of escaping gas from the breech, and when that was opened the empty shell flew out like a champagne cork. The experiment was tried three or four times with larger powder charges, with the same result. Almost a full charge was fired the last time, but the rag remained. Of course the gas of the bigger charge took longer to escape. It was, no doubt, an extremely foolish thing to do, and if tried with anything less substantial than a bullet, it might have led to sad results. I mention this as an actual case of air-space of an exaggerated character.

BENJAMIN SEY.

GLASGOW, Scotland, Jan. 23.

## IT WAS LOADED.

Editor Forest and Stream:

Let me here, for the benefit of the readers of your most interesting paper, caution those of them who, like myself, have been in the habit of carelessly handling loaded shells. To rectify a case, Mr. F. H., of this city, loaned to his friends, say, 30, his new Remington-Union Gun. On their return from a short hunting trip, one of the party remarked that one of the shells missed fire. Mr. H. said he never knew of his gun missing fire and asked to see the shell; it was handed to him and he said "Oh, yes. I see the cap is no good." He then placed the shell (a brass one, loaded with 4 drams of powder and 1 oz. No. 4 shot) in the extractor and pressed down on the lever. Immediately there was a loud report, the concussion disintegrating the hammer, and Mr. H. exclaimed, "I am shot, boys!" and fainted.

I was hastily summoned, and found that one finger of the

left hand was shot entirely away, leaving nothing but the bare bone protruding. Another finger and the thumb were each badly ripped open, the left cheek cut through from the mouth to the left eyebrow, and the left eye cut open for about one-third its length.

I amputated one finger and dressed the remaining wounds, and subsequently the eyeball itself was removed.

The young man is yet in a precarious condition, but I think that with judicious treatment the other eye can be saved. The shell itself flew in three pieces, the shot being slightly imbedded in the door.

I am constrained to send you these facts partly because the accident is somewhat unique, and also as a warning to other indifferent sportsmen who may be tempted to extract caps from loaded shells, a thing I myself have often done. It may be scarcely necessary to add that I have performed that exploit for the last time. J. L. WILLIAMSON, M. D.

MILWAUKEE, WIS.

## MYSTERIOUS MONSTERS.

A. N. East Douglas, Mass., correspondent, writing under date of Feb. 4, says: "Our town and those about it are much excited by the presence of a strange animal. His recent appearance on Jan. 24 during the night, and his tracks found about the outbuildings of our farmers. About a week ago he was seen by two men, who were within a few feet of him. They give this description: Head large and shaped like a cat's, with short, erect ears. Body heavy at the shoulders, tapering to the flanks, with a long tail; hair reddish brown above, below of a lighter shade; height about twenty-eight or thirty inches at shoulder; length five or six feet not including tail; of a four and one-half inches by six. He has been seen by several different persons, and all agree very nearly on the points given. What is it? I am inclined to say a panther, but as I know but little about them, would like your opinion. His trail has been followed by some of the local hunters, but no one has succeeded in getting a shot at him as yet. He seems to have a wide range, and to turn but little while traveling."

The description is that of a panther (*Panthera concolor*). In this connection we republish from the Atlanta (Ga.) Constitution the following account of a visit by "Uncle Remus" at the office of that paper:

"You all gentlemen nee n'ter ax me how I is," said Uncle Remus as he came in yesterday—"you nee n'ter ax me, kase I'm p'ly an mighty p'ly at dat." "Uncle Remus's manner of anticipation and his ready inquiries after his health attracted attention, but he said nothing. Every member of the editorial staff appeared to be deeply absorbed in his work. Uncle Remus waited a moment and then advanced to the grate and proceeded to warm his hands.

"Look lak de mo' I try ter git 'long de wuss ol' I is," the old man continued after a while. "I bin livin' out dar at Wes' E'en' year 'fo' he 'as in his year, and sot in ter live out dar dis year, but de devil come in de way, and he 'as in de year, or somer's else. He 'bless I kin stay dar twel' February. You take in give a man de spence w'at I got, an I 'bout he'll up say dat niggers ain't got no chance in dese Ninety-two States."

"Who has been troubling you now?" someone asked.

"Taint no w'ite folks," Uncle Remus replied. "I'll say dat. Taint no w'ite folks. De nigger, kase he 'as in de year, but de devil come in de way, and he 'as in de year, or somer's else. He 'bless I kin stay dar twel' February. You take in give a man de spence w'at I got, an I 'bout he'll up say dat niggers ain't got no chance in dese Ninety-two States."

Here there was a pause, so Uncle Remus searched around in his pocket for a chew of tobacco.

Presently he went on:

"Fus yer come de McCombe an set over agin de mornin' star den de elements turn an turn yer self loose, an den de like welder croke on me, an now, bless gracious, yer come 'long folks an say de woods is full of deez yer by-enuss creatures or some wharther kinder varment w'at I aint kotch de name um. Whar Mars Ivins Howell?"

The old man was told that he was in the editorial dressing room, just across the hall. Uncle Remus sighed, but did not enter the boudoir.

"De tell me," he continued, "dat dat varment got out darin Mars Ivins' back-yard, an chawed up a beef leg dese like folks chaws up rody cracker, an den he tuck an fan out dar an greet big English nasty, dese same ez 's'ed bin ou'er deez tarrier dogs. Now den, of Mars Ivins' 'll des up and tell me 'bout in his own mouf dat dat creature is servicus 'nuff fer ter han'le dat big nasty dog, den I'm gwine back home an fling my dole in de day an look out from der, kaze Wes' E'en' ain't no place for ole cripple nigger like me."

"It's done got ter pass whar sumpin' 'n'er got ter be done, an dat mighty quick. Miss Sally, she speck hit's dese ou'er dem an Kluk-Klusers, but Miss Sally she er cuse w'ite 'oman dat dey ain't no tellin' we'll see's roun' a rig on you, an mo'n dat, wat de ou'er or goodness make de Kluk-Klusers run 'round on be all-fours an paw up de groun' in Mars Ivins' back-yard. Dat w'at I wanten know."

"Why don't you take a gun and go out and kill it?" some one asked.

"Who? Me?" exclaimed Uncle Remus in a tone of mingled derision and astonishment. "Bless yo' soul, chile, ef dat creature 'll des lemme 'lone much ez I do hit, dey wout be no kinder 'spite twixt us. Too much room in dese Ninety-two States fer ole Remus ter be ebrown' up 'gin dat creature."

"Sis Tempy say she seed it, Sis Ferraby say she seed it, an Sis Minty say she seed it; an den yer kase Brer Rastus an say he seed it, an Brer Plato say he seed it. En fum de time dat Sis Tempy seed it twel de time dat Brer Plato seed it, hit done growd lev'n foot. Dat w'at make I so skeerd. Dey all does mighty funny," continued Uncle Remus, shifting his weight from one leg to the other. "Dey meets it in de bushes an dey looks at it, an den dey goes off en tells folks 'bout it. I 'bout you ef I meets dat creature, I'll make de neighbors. I'll des take an fetch a squal dat'll make de chickens crow in Chattahoochee."

"Sis Tempy 'low dat it took so thin in de dank en so keen in de quarters dat she speck hit's a sperret. Oh, you kin laugh," exclaimed Uncle Remus, as one of the staff hastened to hide his face behind the Springfield Republican. "You kin laugh, but ef dey's any haugin' in dis kinder bizness, I'd er done 'low' in out endurin' er de seventy year w'at I bin scufflin' long in deez low groun's. Sis Tempy, she 'low dat she speck it's a sperrit, an Brer Rastus, he 'low dat it mount be a witch. You go out ter Wes' E'en' an you kin see de entrenches yit whar folks got killt. Dese es sho' yer settin' 'der dey's quare gwines on und de cnoopies after folks is disingwine."

"What do you propose to do if it is a witch?" the statistical officer asked.

"I done dur a hoss-shoe in de bedpos', an I burns salt in

de fier, an sez my pra's out loud 'ev'ry night er de worl'," replied Uncle Remus, seriously, "but seem lak de creature ain't a keerin'; an now I'm gwinecher my progance. I'm gwine in dat place dar, eu I'm gwinecher ax Mars Ivins Howell 'bout it, an ef dat creature 'bin a cuttin' up in his back yard, den I'm gwinecher go home an load up my ole musket 'bout de mouf, an ef I des yer a sick crack, I'm a gwinecher open de do' an shud my eyes on 'em, an den I lay if dat creature is made out'n flesh an blood, I'll make 'im show up. Des put dat in de paper, kaze ef any nigger gets hurt close by my house, I wants ter get de law on de v'ertin' on my side."

Whereupon, Uncle Remus departed triumphantly into the editorial boudoir.

## GUINEA FOWL AS A GAME BIRD.

Editor Forest and Stream:

Last summer, while working in my boat "mill," I noticed half a dozen young guinea fowl on a piece of salt meadow. The tide was rising, and after a time surrounded the small hummock upon which the birds were feeding.

I wondered what the little chaps would do when the water reached them. In fact, was thinking of going to their rescue in a boat, when, without the slightest hesitation and very much to my astonishment, they one by one plunged into the water and swam ashore.

This suggests the question, Why not turn some of these birds loose at sea and use them as a substitute for wild ducks after we have succeeded in exterminating the latter?

Sometimes, when out with my setter, I have known guinea fowl to "die" and the dog to "stand," but never once when the bird was not sitting on a nest full of eggs.

On such occasions the bird when poked out will fly—I think to lead man and dog away from her eggs; but at other times the fowl usually prefers to run, rather than take to flight, upon which the birds were feeding.

An objection to turning guinea fowl into the woods in this climate occurs to me. They would all starve to death on the first heavy snowfall.

THOMAS CLAPHAM.

ROSLYN, L. I., Feb. 12.

## DEER AND SMALL SHOT.

YOUR correspondent, "Wells," may doubt that deer are ever killed with small shot at ordinary ranges; nevertheless it has been done many times. Shooting ruffed grouse in close thickets I started three deer. On the impulse of the moment I gave the nearest one a charge of No. 6 shot in the ribs. I considered I had made a cruel and useless shot and so did not repeat the dose. You can believe I was surprised to find the animal dead in her tracks a short time afterwards. Every shot that missed the rib hit and penetrated the lung. Actual distance, as stepped off, twenty-two paces.

On Cold Creek Prairie, near Sandusky City, in company with a friend, snipe-shooting in October, I saw him bring a deer down dead, with hardly a kick, with No. 9 shot. It was many years ago, but as I remember, the distance was not far from four rods.

On another occasion while quail-shooting a doctor in company killed a deer with No. 6 shot at twenty-six paces. On careful dissection it was found that a single shot was the cause of death. This one opened the large vein (*Vena cava descendens*) of the abdomen, that lies directly under the backbone.

DR. E. STEINLE.

CLEVELAND, Ohio.

QUEBEC FISH AND GAME PROTECTION CLUB.—Following are the proceedings of a meeting held at the Quebec Exchange on the 5th of February, 1889, for the purpose of taking measures to prevent the illegal slaughter of moose and caribou, during the close season. Present: Messrs. Rhodes, Percy Dean, G. Thompson, W. J. Ray, J. Hamilton, C. A. Pentland, A. Waters, J. D. Gilmore, M. Macdonald, D. Campbell, H. S. Smith, F. C. Wurtelle, Austin, W. D. Campbell, Coman, Captain Peters, A. F. Hunt, J. S. Budden, D. C. Thomson, Vohl and others. Colonel Rhodes was called to the chair and Mr. W. D. Campbell requested to act as secretary. The secretary read the advertisement calling the meeting, and the president then addressed the meeting, explaining the circumstances under which Baron Le Grange, of Albany, had secured the license for scientific purposes. Mr. Pentland pointed out the great evils which would result from the example of persons killing game under license during the close season. It was resolved that a petition be prepared and signed by all present at this meeting and others, setting forth the objections to the granting of such licenses and the necessity of strictly enforcing the game laws, and Messrs. Pentland and Campbell were requested to prepare such a petition. Resolved, That a club be formed under the name of the Quebec Fish and Game Protection Club, for the purpose of preventing the illegal killing of game and fish in the close season. Resolved, That a committee of this meeting should at once proceed to hold an interview with the Hon. Mr. Lynch, Commissioner of Crown Lands, to request that the license granted to Baron Le Grange be withdrawn, and that the Hon. Mr. Lynch, which was granted; and after hearing the members of the committee he assured them that he would do all in his power to enforce the game laws and to limit the exercise of Baron Le Grange's license to the object for which it was granted.—W. D. CAMPBELL (Quebec, St. Lawrence, 1888).

POTOMACKEEPSIE GAME MEN IN TROUBLE.—Through the exertions of some of the local sportsmen, a move has been made to break up the illegal trade in game carried on in that city. Game Protector Brayton, of Albany, was sent for, and on Feb. 3 he lodged complaints with District Attorney Hackett against Smith Bros., G. A. Maas, and William Knies for having in their possession, contrary to law, certain game after the first day of February. In the case of the Smiths and Knies the game was quail, and in Mr. Maas's case rabbits. All three of the persons named have been indicted by the Grand Jury. By the way, having mentioned Mr. Brayton's name, can that gentleman explain how it was that on the 6th of February venison was displayed at the Delavan House, in Albany and served at the table?

THE MISSOURI ASSOCIATION publish in convenient form their constitution and by-laws, with rules for trap shooting, together with the game and fish laws of the State. The pamphlet gives these facts concerning the society: "The origin of the Missouri State Sportsmen's Association, though not quite a tradition, has not been preserved in its minutes. The credit of the original organization belongs to St. Louis, Kansas City, St. Joseph, and the clubs of those cities. The first meeting was held at St. Louis, in 1878, and D. L. Hall and J. E. Guinotte, of Kansas City, elected president and secretary, respectively, for ensuing year, and Kansas City was selected as place of convention of 1879. The second meeting was then held October 22, 1879, at Kansas City, the constitution and by-laws adopted, officers for 1879-80 elected, and Macon City chosen as third place of meeting. In 1881 the convention was held at St. Louis, and tournament fishing by St. Louis Gun Club, and in 1882 at Sedalia, and tournament given under auspices of the Sedalia Gun Club. The present officers are: F. Houston, Sedalia, President; Paul Francke, St. Joseph, First Vice-President; W. W. Judy, St. Louis, Second Vice-President; J. C. Parnier, Sedalia, Recording Secretary; W. R. Thomas, Sedalia, Corresponding Secretary.

PENNSYLVANIA GAME AND FISH LAW.—CHAWESSE, Feb. 8.—The Chawassa Fish and Game Protective Club held a meeting Feb. 8, and reorganized by the election of the following officers: W. G. Yetter, President; Abel Thomas, Vice-President; Wm. Eyer, Treasurer; A. H. Sharpless, Secretary. It is the intention of the club to strictly enforce the game and fish laws in this vicinity. A committee consisting of W. G. Yetter, H. A. Aldrich, W. H. Rayen, Esq., and A. H. Sharpless was appointed to draw up and circulate a petition asking the Legislature to amend the fish laws relating to illegal fishing, so as to enumerate more explicitly what is meant by "permanent set means," etc., and the game laws to allow the killing of pheasants or ruffed grouse from Sept. 1, also asking that a bounty be offered for the killing of hawks. The club think the above changes proper, and ask the different clubs throughout the State to take a similar action, and through their representatives to bring the subject before the Legislature now sitting.—A. H. SHARPLESS, Sec'y.

PENNSYLVANIA.—HOLLIDAYSBURG, Jan. 15.—The past shooting season has been rather a poor one in this section; ruffed grouse are scarce and wild, and white rabbits are plentiful than ever before, the quail have just begun to reappear, and the deer and turkeys are the objects of the terrible winter of 1888-89. If we could only get the "scaly leg" as our granger friends call it, on the statute books again, we might have reasonable hopes for the return of the splendid quail-shooting of four years ago. Woodcock shooting during the past summer and fall was a farce. I think not over four score birds were killed in the county. Since the close of the season our young shots have turned their attention, and with fair success, to the destruction of the foxes, whose numerous dog-like tracks dot every thicket, field and knoll. One young man has seven hides laid away to dry, all of them shot before the dogs, and proudly has the distinction of making a right and left on this cunning "burd," as they played along in front of his pack of beagles.—T. D.

MINNESOTA.—AUBURN.—I am very glad to note the stand you have taken against the park grab. Whatever the outcome may be there are here many ardent admirers of your action and fearless treatment of the seal. I have been and am a constant reader of the "Forest and Stream," and I would like to see the "scaly leg" as our granger friends call it, on the statute books again, we might have reasonable hopes for the return of the splendid quail-shooting of four years ago. Woodcock shooting during the past summer and fall was a farce. I think not over four score birds were killed in the county. Since the close of the season our young shots have turned their attention, and with fair success, to the destruction of the foxes, whose numerous dog-like tracks dot every thicket, field and knoll. One young man has seven hides laid away to dry, all of them shot before the dogs, and proudly has the distinction of making a right and left on this cunning "burd," as they played along in front of his pack of beagles.—T. D.

"RISING YOUNG SPORTSMEN."—Editor Forest and Stream: After you get through with the Yellowstone Park speculators, could you not fire a single volley at the benighted press of this State, so that one might read so influential a journal as the Philadelphia Times without running on some half a dozen clippings like this: "Young Johnny Pig-head bids fair to become one of our best shots. On last Monday he killed seven quail with one shot from his father's gun." Dr. Mr. and Mrs. G. Townsend, is one of our most successful sportsmen; he recently killed seven wild turkeys with one shot as they followed a trail made with corn to the blind in which he sat." It is "a thundering pity" they did not beat his pot-hunting head off with their wings, for a very few such men will more thoroughly clean a country of game than a regiment of decent shooters.—T. D.

UPPER MICHIGAN.—Union City, Ind.—I noticed that in your issue of November 16, Major H. W. Merrill recommends Mackinac and Schoolcraft counties in Upper Michigan, as a good hunting country. I went there last October with four others on a hunt, and must say it is the worst country I was ever in. The railroad from Point St Ignace to Marquette runs nearly the whole way through a narrow, sterile, and treeless country, and the roads, more or less, consequently we gave it up in disgust and came home without seeing a deer or bear.—D. B. C.

NOTE FROM FLORIDA.—An Oak Hill correspondent writing under date of Feb. 1, says: The shooting has been wonderfully good this year, big bags of all kinds of game being the rule instead of the exception. The fishing has not been extra good thus far on account of inclement weather, still some good fish have been caught, the largest weighing 42 lbs., a channel bass. The Duke of Newcastle and a friend, Mr. Langley, of England, are here now, fishing and shooting.

NEW YORK.—Foxes are plentiful; one man here got a double shot, killed one, and shot one foreleg off the other, and then it got away from him. Your correspondent, Clarence A. Farnum, of Wellsfield, has been appointed County Judge of Allegheny county. If his judicial decisions are as sound as the game question there Allegheny county is to be congratulated.—J. O. FELLOWS (Hornellsville, N. Y., Feb. 4).

NEW GLASGOW ROD AND GUN CLUB.—New Glasgow, N. S., Feb. 3.—The annual meeting was held on the 1st inst., and the following officers were elected for the ensuing year: President, W. B. Moore (re-elected); Vice-President, A. M. Frazer; Secretary and Treasurer, J. H. Cavanaugh (re-elected); Executive Committee, Norman McKay and H. T. Sutherland.—GLOBE SMITH.

MASSACHUSETTS.—East Douglas.—Game has been quite plenty here this winter; the woods were full of squirrel, grouse were plenty, but quail were scarce.—AMATEUR.

NEW ORLEANS, LA., Feb. 5.—Our hunting has never been so poor as this season; no woodcock; very few snipe and ducks; quail, of course, plenty, also rabbits.

## Sea and River Fishing.

To insure prompt attention, communications should be addressed to the Forest and Stream, Publishers, Co., and not to individuals, in whose absence from the office matters of importance are liable to delay.

\*The broad-side bream.

The wary trout that thrives against the stream;

The well-grown carp, full laden with her spawn;

To take the fish, is give her leave to play,

And yield her line."—Shepherd's Eclogues (1614).

## WITH HACKLES AND GENTLES.

VII.

"Angling one summer moon alone.

I sat me down upon a stone,

A little parlous brook beside,

Whose modest, silver, rippling tide,

Mov'd by the zephyr's softest sigh,

Was scarcely heard by passer by."

FEW are the friends from whom an angler can choose a boon companion to fish with. There is that in the "gentle art" which shrinks from a coterie and can only be thoroughly enjoyed by the "lone fisherman," or, at the utmost, by twain, and then the twain must be as "one flesh" in the pure and simple love of the pursuit. Yet who dares call angling an "selfish pleasure"? No brother of the craft, I trow, and cynics always sneer at what they cannot comprehend, or lack in taste to enjoy.

The angler is "never less alone than when alone" for the varied forms and phases of nature are with him in sympathy, pleasant thoughts are inseparable from him, and the very trout which he deftly and humanely transfers from the stream to his creel seem to have a subtle understanding that he is their friend and no foe at all.

"Do I write a paradox? Let us see. No angler, *par excellence*, is a butcher, nor does he crush the daisies by the meadow brook athirst for blood. He comes alight intent upon pleasure, to which the blithe birds, the flitting butterflies and the sweet flowers in their bow minister. The very air is balmy and the purring brook, both a charm beyond that of being the habitat of fish. The graceful sway of the birch and the alder he mimics as he casts his fly, and mercy, not greed, controls his catch. Didn't ever see any "cold, pitiless depths" in an angler's eye? I never did, and I have looked straightforwardly into many (some were, alas! closed to the pleasant scenes of earth) since I threw my first fly, at the callow age when the very thought of "crossed feet" and gray moustaches was unknown. How- ever lined and flamed by age and care, the face of the veteran angler, with a gleam of youth upon it, and the kindly touch which Nature gave it can never be effaced.

Here and now I am constrained to pay a fond tribute of praise to an honest angler whose genial and kind face has been lately hidden by the cere-cloth of death, and whose form has been laid away in the dust to await the general resurrection at the last day. How often, in our piscatorial chat, have I seen his face gleam with pleasure and his face all with the love of the craft of which he was so thoroughly the master. His was a type—and a right noble one—of an honest angler's life and love, and those who knew and loved him the best miss him and mourn him the most sincerely. Quiet, gentle, unobtrusive, like many a pure stream he was wont to leave and cast his fly upon, he passed from our sight so suddenly that his loss cannot be fully realized. "Long to us keep in memory green" and may his light perpetual shine upon him!

Of necessity the life of the angler, in practice of his craft, is contemplative and, barring short "runs" and doubtful crises, there are few exciting incidents in brook fishing. An angler may, perchance, ride hard to hounds, or put no dog to shame on the moor, but, pent in the "blind alley" of truth, the odds are he will confess that his first and dearest love is his rod and the "parking stream."

"*Beati meritis non finit*." So may it be said of an angler, and once an angler always an angler may be as positively asserted. True, he may have little or no practice with his rod for years, but present the opportunity and the angler is "to the fore," with nerve aquiver for the first cast, and eye ready to mock the giant of the captured fish.

Once (forsooth a few times) in a long life there may be found a congenial soul with whom we can be at one as we fish and revel in the beauties of Nature, but the harmony must be so complete and perfect as to be unique in common fellowship and purpose. Deny it who may, there is a subtle influence in the pursuit of the gentle art that may be as easily affected as the flexions of the magnetic needle, and then all becomes awry, "like sweet bells jangled," the gentle spirit shrinks and shudders like the aspen in the blast.

Desolation is a tireless hound and gives no quarter! It follows "hand up" the tread of civilization and in many fields "hand up" by a mere may he find the legend "Ichabod,"—its glory is departed! Depleted waters, dammed (and dammed) streams and befooled lakes are the order of the day and generation, and it becomes the bounden duty of every angler to befriend his craft, the godly fish and his favorite haunts.

It is high time to send the "black flag" to the peak, and all "trout lugs" should be taught its significance. The gentle stream must be made more and more a place of nature when rude feet and ruthless hands invade roads of nature that should be forever inviolate against the Goths

\*Mr. Lorenzo Prouty.

and Visigoths, who have no scruples as to how, or with what size of fish, their creels are filled.

Zounds! I have written myself into a furious pet, and digressed a long way from my intent.

Unhurd! Every reader must answer for himself, and every fisherman must act, as he best can, in what I have suggested. There will not be a decent fish to "sweat by," much less to catch, by the time we slip into the "clean and slippery pantaloons" period of life's pilgrimage. O. W. R.

## FISHING THROUGH THE ICE.

THINKING that a few words from this section of the country to my fellow sportsmen in the East might be accepted, I have determined to give you a short account of a fishing trip I had to-day along with a fellow "tenderfoot." I have been located in this part of the country (they call it God's Garden in the Leadville and Gunnison papers) for just one week and probably heard more fish-swooped about mountain lions, wild cats, elk, deer, bear, beaver and trout than I ever heard before, but I did want to have the chance to do something myself. Tales of trout of fabulous size and gameness that could be caught "in the spring" were continually being sounded in my ears, but to my oft repeated question "Why don't you catch them now?" the never-failing answer was, "They won't bite, they ain't in the creek now." "Then, when are they?" "I don't know, gone down to the river, I reckon." To make a long story short, I got tired of that inevitable answer and determined to look for them in the Surface Creek, and with what success you may judge for yourself.

Last night Al said he would go with me, so we hitched the two mules to the "democrat" this morning and started off. I must confess, with no hopes of success.

In the way we stopped at "Sheep's" to get the mail and there had the supreme satisfaction of getting the opinions of three of the oldest settlers in the country, and they all agreed that "we couldn't catch a trout nowhere; might get one, etc., etc." That, of course, was a splendid thing for our already much depressed spirits. However, we jogged along till we reached an old beaver dam, the point we had settled upon to make our trial. Al grasped the axe with a sort of a now-or-never determination, and set to work to cut a hole in the ice.

After chopping for a while we found that a shovel was an absolute necessity, and after we had made another "old settler's" cabin and there once more had the benefit of four wise heads' opinion on the trout question. They all agreed again, though finally old "Treacle" did say that his boy had seen one trout not long since where they got their water. Back we marched again and finally succeeded in cutting a hole.

I was carefully "putting a look on my line and getting ready for business when a wild yell from Al announced the pleasing fact that he had hooked a fish, he had lost him. Of course he was a "whopper." Procuring short poles from the brush we set to work, and then the fun began. Al had the start of me, and had landed five large fish before I dropped my hook in, and when I did get started the second fish took my hook, and things then were blue. By the time I got ready again Al had ten fish the start, but the way things did go for about fifteen minutes was a caution. When one of us was taking one of the other would fish, and so we kept it up for half an hour. Finally we dropped two more hooks, but they were not up to our first location, so we stuck manly to that one. We fished, I should say, about three hours, and the total catch was eighty fish, largest one pound, no "fingerings," five fish weighed to gather three and a half pounds, net weight of all sixteen pounds, average three and one-fifth ounces. Not very bad for a place where we were told there were no fish. On our way home we came by the "back way," no wishing to get of our good fortune to the entire settlement, and to-morrow we intend trying another spot before the news spreads. Think of it—people settled all along the bank of the creek and living on hog, venison and rabbit altogether, when within fifty yards of their doors such dainties can be so easily had, no thought say for the asking. Maybe John, our host's, eyes didn't open when we came home. This, you know, is a new country, and any sportsman can find a world of game if he will come so far.

THE REBERSTADT, CO., JAN. 29.

## PENNSYLVANIA ASSOCIATION.

THE Anglers' Association of Eastern Pennsylvania has taken a very handsome club room at 1029 Urech street, Philadelphia, and at a meeting Saturday evening the 3d, President Spangler told of his taking a large shark in our bay in which when opened were found sixty-eight pounds of beef bones, crabs, etc. Other members narrated similar adventures.

This meeting was the first one held in the new rooms, which are large and commodious, and will go far toward promoting sociability among its members. The old rooms at Broad and Fairmount avenues were not central enough, and consequently but few of the association frequented them. It is the purpose of the society to decorate the walls of the new room with angling scenes, trophies, specimens of tackle, etc., and to have the tables supplied with appropriate literature. In addition to this it is said there will be weekly bulletins from all the fishing centers as to whether the fish are biting, and regarding the condition of the weather and streams.

President Spangler stated the society was in communication with the State Fish Commissioners on the subject of stocking the rivers with fish, and a committee had been organized on Perkiomen Creek was read, recommending that body of water as an excellent breeding place for the rainbow trout. This we do not recommend, as the stream is stocked with black bass—at least that portion a mile from the Seluylkill—and these fish will be destructive to the fry in their growth.

The anglers club was organized last November, and has now 120 members. Its objects, as they appeared in its prospectus, were the encouragement of fish culture in Pennsylvania by the restocking of its streams with game and other valuable food fishes, the protection of the same by a rigorous enforcement of existing laws, which are strong and good, and the advancement of the art of angling and the promotion of sociability among anglers. Doubtless a fly-casting tournament will be inaugurated in due time.

Homo.

MASSACHUSETTS.—East Douglas, Feb. 1883.—Some fine strings of pickerel have been caught here in late through the ice, one of twenty-one weighing 33 pounds; another of forty weighing 32. Among these were several weighing between four and five pounds.—AMATEUR.

## THE BLOODHOUND.

WE have received many inquiries regarding this once famous breed of dogs now nearly extinct in this country. Vero Shaw, in the "Book of the Dog," gives the following account of them:

Though the bloodhound has lost much of his former utility, the breed is nevertheless one that is generally admired in the present day. The noble proportions of the dog, his magnificent head, and the knowledge of what he has been known to do for each and all, not only agencies in his favor, and the usually brilliant color of a bloodhound is also an additional attraction. The uses to which this breed of dog was originally put in this country were the tracking of wounded game and the pursuit of malefactors. For other purposes their marvelously keen powers of scent admirably qualified them.

According to the "Naturalist's Library," the bloodhound was usually about twenty-eight inches high. The author of "Cynographia Britannica" gives the height as twenty-seven inches, and describes the dog as being—

"Of a strong, compact and muscular form; the face narrow, snout and nostrils wide and large; lips pendulous, ears large, broad at base and narrowing to the tip; tail strong, but not bushy; voice extremely loud and sonorous. But what most distinguishes this kind is their uniform color, a reddish-tan, gradually darkening on the upper part, the texture of the back, becoming lighter on the lower part and extremities.

"There is no doubt he was originally the only dog used to trace game by the scent in this country. The manner of the hunt was that all the game was first surrounded by the hounds, and then the game was followed by the arrow or wounded by the spear; if in this state it escaped, the bloodhound traced and the mastiff or hunter killed it.

It will thus be seen that from the earliest records the greatest value has been attached to the keen scent possessed by a bloodhound; but in the present day the dog is practically useless, such a thing as a pack of bloodhounds being almost unknown.

On account of his marvelous scent the bloodhound has from time immemorial been associated with the capture of escaped criminals. Dr. Cairns, and in fact the majority of earlier writers, have all alluded to this dog's success as a thief-taker, and his praises have been sung or sung by every canine writer down to the present day. The natural consequence of so much adulation has been that the bloodhound is credited with almost supernatural powers by many persons, and the simple exercise of its natural powers of scent by an ordinary dog under peculiar circumstances has been before now turned to the glory of the bloodhound by ignorant folk.

We do not, however, in the smallest degree desire to underestimate the value of the bloodhound for the purposes of his power of scent, which we believe to be of the highest. Unfortunately, his uses in the present day are not numerous in this country, and beyond a few cases being serviceable as a guard about a house, the bloodhound may be recognized as included in the ornamental but not useful category of dogs. The disposition of the bloodhound is not by any means one upon which implicit reliance can be placed, and his size and immense power render him, when roused, a most formidable and dangerous animal.

From the writings of many old writers there appears to be small doubt that in early days there were more than one strain of dogs used for tracking purposes, and it is probably from an amalgamation of these that the modern bloodhound originally sprang. Gervase Markham describes a talbot, which on a short relation of the bloodhound, as a round, thick-headed dog, with a short nose—characteristics which certainly do not appear in modern bloodhounds. A connection may be established between the present breed and other early varieties, if the subject of color is studied, for a black race of hounds known as St. Hubert's were formerly thought of, and it is very probable that from these the modern hound has derived the black saddle, which is so prized by breeders of this variety.

In the present day, though there are many more persons in possession of bloodhounds than formerly, the breed cannot by any means be said to be widely popular. In days gone by there was considerable difficulty in obtaining pure-bred specimens, but even now that good whelps can readily be obtained at a comparatively trifling cost, the number of breeders seems to remain a very limited one. This neglect or apathy on the part of the public to support the bloodhound no doubt arises in a great measure from the stories which have been related concerning his ferocity. That the animal when roused is a formidable foe there can be no room for doubting; and his ferocity when on the track of a bloodhound, or the latter's existence when run down, in fact, as will be seen from the quotation given above, the hound in hunting was usually not permitted to break up the wounded animal, who was handed over to the fowler, merely to give a pleasant to the hunter. The ferocity of a bloodhound's temper as it may, we know of more than one specimen of the breed which is thoroughly under control, and of whom, in the presence of its owner, we should have no misgivings, under any but the most exceptional circumstances. In the case of the bloodhound, with this breed, as others, the royal road to successful management.

The subject of color is one upon which several conflicting opinions are brought to bear. All, however, seem to agree that white is the color of the bloodhound, and that a decided bluish is not absolute disqualification, on the show bench. Some modern authorities even go the length of saying that any white at all—a snip on the forehead, a splash on the chest, or a spot on the foot—should prevent a dog from winning at an exhibition. Before, however, giving an opinion on such a subject, it would be well to look back and see what amount of white was allowed the ancient bloodhound. According to the records, in the "Book of Hunting," the hounds were white, with a few spots of color on the head and neck. This was certainly true to several other colors which he gives. This must certainly tend to prove that white was permissible if not actually a desirable addition to a dog's color in the earlier days of canine literature. It is therefore hard to discover any sufficient cause for supporting modern authorities who advocate the disqualification of hounds which show traces of white. It marked too heavily great injury is certainly done the hound's appearance, and white legs, or a large patch on the chest, would very probably jeopardize his chance

of winning a prize under most judges; but for our own part, we are of opinion that slight indications of white should not stand between a bloodhound and success on the show bench. Another point in order upon which great stress is laid is the acquisition of the black saddle upon the back, the non-possession of which has caused more than one good dog the loss of prizes.

## DESCRIPTION OF THE BLOODHOUND.

The head, which is undoubtedly the most remarkable feature in this variety. The skull should be narrow and domed, very long, with the occipital bone terminating in a high peak at the back. It is also covered with thin, loose skin.

The jaws long and narrow, the flews of the upper being very long and pendulous, thin in texture, and extending below the lower one.

The nose large and black, with the nostrils well developed. The eyes rather small and deeply sunk, of a light brown color, and showing the hair, or inside, red lining.

The ears must be set on low, and should be as long and fine in texture as possible. As regards length, they should meet in front of the nose, and the more they lap over the better.

The neck is rather long, and is furnished with a heavy dewlap.

Shoulders rather slanting.

Body moderately wide at chest, with powerful loins.

Fore legs set on straight, and very powerful.

Feet round and compact. Many specimens exhibit flat feet either from bad rearing or other causes; the pasterns get crooked and the feet splayed, which certainly should disqualify a hound in competition.

Stem rather coarse, long, and carried gaily.

Color.—The best and most popular is a deep tan, with a black saddle on the back. The tan in many specimens varies in depth, and in some the black of the back is flecked with tan, which, though not a disqualification, is undesirable. The presence of white we have already alluded to above.

in the world. I hastened forward to my stand, when the deep boom of a gun broke through the frosty air. As I came into the road, all broke a change. My brother was sitting on the ground, his delicate features pale as paper, with a look of anxiety, his carefully-parted hair all awry, while his gun lay in the road, and he was hanging on to his arm as if he was afraid it would run away and leave him, while King, with an ill-concealed grin, was intently studying a pine which stood by the road. As they caught sight of me, my brother, with a frantic wave of his hand, exclaimed, "I saw the fox! I saw the fox!" "I swear you didn't when you fired," said King, "because you had been caught short." With a glance at King which was so full of sadness and reproach, and which calmly pointed to a hole through the branches of the towering pine, and turning, picked up his gun and slowly and sadly started for home, while King and I continued on in pursuit of the fox, which we finally captured.

DOWN IN MAINE, Nov., 1882.

I will relate the experience of a party of five hunters (three amateurs and two professionals), with their dogs, Jumbo, Tassel-tail, and Diamond Dick. There having come about six inches of snow upon the night of Nov. 15, we proposed to give the dogs a run, and try our luck for a fox. At break of day upon the morning of Dec. 1, we shouldered our guns and started for the Highland Farm, a noted place for foxes at this time of the year; we were in the neighborhood of a week. We cut loose the dogs, Jumbo going to the front with music that would quicken the blood of the laziest fox hunter that ever sat upon a stump waiting for his faithful dog to drive a fox down his gun barrel. It was not many minutes before Reynard was upon his pins; taking a circle across the little Androsoggin, he ran over a poplar ridge with the dogs within forty rods of him; it was useless to try to hear them go; but pretty soon they were in sight, and we were in pursuit of a shot. Lorenzo King, an old fox hunter, sighted him first and stood as straight and as stiff as a stump.

When the fox was within ten rods Lorenzo's gun went to his shoulder; the cap snapped; his gun lying direct at Reynard went on his way to the next man, who also was an old fox hunter, Wm. Heywood, of Pittsfield, N. H. William stood by an old brush fence, and the first thing he saw, Reynard was sitting up within six rods looking for the dogs. William's gun went to his shoulder, his fingers crossed the trigger, and then the other of the triggers, but no go. He looked and discovered that he had forgotten to cock his gun. In the seeing the movement, skipped over the fence and went on his way to the next man. This was George Edwards, an amateur, and the proprietor of Jumbo. George saw the fox coming and was straightway taken with the shakes; he afterward confessed that the fox looked as if it was thirty feet long. Having a heavy charge in his gun George took a hasty aim and pulled the trigger. There was a terrific explosion. George turned two or three back somewhat, picked himself up and took aim; but upon investigation it was found that he had shot the top off a pine tree some eight or ten rods away. Reynard meantime had quickened his pace and passed along to the next man. This was George Edwards, brother to George, and the proprietor of Tassel-tail.

Lewis saw the fox coming, and like George began to shake, but as he had an open field and the fox was coming straight for him he dropped upon one knee and covered the fox with his gun until Reynard was within twenty rods, when he shook so violently that he discharged his gun and then jumped up and sent the other charge after the fox; while Reynard shook out another net, skipped over the fence, across a field down over a bank and into his hole—a sadly frightened and persecuted fellow but a sound fox still. I rushed to the ground and leveled my gun for a shot. Louis pointed at the hole and said: "There he is in there; shoot away." I declined a shot and summoned a counsel of war. George proposed to die for it, but we concluded that it would be a disgrace to take so mean an advantage of a fox that had run the gamut so manly and composed so well. Our verdict was to let him rest.

We'll give him a try some other day.

OWNING, ME, Dec. 6, 1882. W. R. F.

## MR. MORRELL'S CHAMPION BLOODHOUND "ROLLO."

General appearance.—A wonderfully intelligent and powerful dog, not ferocious-looking, and one that seems incapable of great speed, though apparently full of stamina. Coat short and close.

We reproduce from the *Kennel Gazette* a cut of the head of Mr. L. S. Morrell's celebrated champion Rollo, E. K. C. S. B. 1331, who died a short time ago. Rollo was first shown at the Crystal Palace show in 1874, when but little more than a puppy, when he won the in a very good class. He has since been shown twenty-seven times, winning seven champion, twelve first, and eight second prizes.

## SOME OLD-FASHIONED FOX HUNTS.

A WEEK ago Wednesday 1 and my brother George and friend King made great preparations to chase Reynard to his death. It was a glorious morning, a heavy frost covered everything; the air was still and frosty, sending the blood through a man's veins with a tingle that was delightful. As I sallied forth, armed and equipped for the affray, with Jack, my white and tan foxhound, who was making frantic endeavors to turn himself inside out, so great was his joy in anticipating the sport forthcoming, I was met by my brother and his dog Jumbo, who is one of the most magnificent dogs of his breed that I ever saw, weighing nearly ninety pounds, with ears that brush the morning dew, he stood a splendid picture outlined against the frosty sky. My brother had his usual equipments, consisting of a haversack full of "grub," a smoking-glass, and a tin of hair cream, and the very essence of his delicate monotone was in his place. I looked back half expecting to see a servant carrying a lounge or cot for him to lie on, or an invalid chair to wheel him about. I sent King and George ahead to a place that I thought the fox would cross, while I took the dogs and started for the burrow to start him out. When I arrived at the burrow, after a few preliminaries the hounds broke forth in eager cry, sending a sound through the air which, to the ears of a fox-hunter, is more delightful than the most music

The "Haumont Fox Hunting Club" had their meet on the 29th of January, at "West Nyack," Long Island. The morning was not altogether unfavorable for hunting, although cold and chilly; the snow had disappeared, and the frost was nearly out of the ground.

At half-past ten o'clock the hounds were thrown into cover. In about half an hour Nellie opened, and continued to pick up a cold scent for about a mile, leading to North Sea, when the hounds were whipped off.

A start was then made for Shinnecock Hills, where several acres adjoining Cold Spring were drawn back. Two foxes' tracks were discovered on the sand on the beach; although they were old and the hounds could not take them, yet it was supposed that a fox was near at hand. Part of the hunters were called to a place for a moment, and the other part of the hunters was beating the islands and woods near Cold Spring "flat." All at once there could be seen a great commotion and excitement among the hunters on the side hill. Hats were thrown up to attract attention, and the hounds were sent in. Reynard was up and had endeavored to steal away unseen. It was previously arranged that the hunt should be conducted in the old-fashioned, native way in this locality, viz.: the gentlemen should go in wagons, carry guns, and shoot the fox if a chance should occur. It being thought desirable to kill a fox to blood the young hounds.

The hounds being brought and put on the scent, the excitement among the hunters became intense. It only requires one such scene to be remembered through life. No one could imagine that the old and young could be so much interested in their actions. Captain Rose took up Ed Jennings, Elias Jennings and Mr. Robinson, and dropped them at different localities; then galloping his last post, he took his stand at the head of the pack, and was in the island about a mile, and is a favorite crossing spot

for foxes to take upon leaving the hills for the woods. The hounds having been put on the scent by Mr. Whitaker (who had no gun and who remained with the hounds to hunt them), ran the fox quite lively for some minutes, which gave all the hunters time to locate themselves in such places as suited them.

The hounds pressed the fox so hard that he had to leave, and broke cover in full view at the northeast corner, running a small distance in the open to another small opening, which he ran through without stopping; and going again into the open, running straight for Ed. Jennings, who, when within ten paces or nearer, let go two barrels, missing him each time. Jennings's son-in-law, who was near by, shouted out to him to throw his gun at him. The fox upon being headed ran for Cold Spring, when crack went Mr. Robinson's gun; and in a few seconds Ed. Jennings tried his hand and gave him a gun; but all to no purpose, the hounds now taking him due southwest, skirting Cold Spring, when they altered their course for the railroad track. Reynard then turned his head due east, running parallel with the track, then turning, he ran northeast for the woods; all this time in sight on a side hill. Up to this time all had been excitement, the fox having so far escaped. The hunters now sought their horses and wagons to make another effort; and took a short cut across the plain to get ahead of the fox and hounds.

Captain Rose, seeing his chances of a shot gone, got behind his last ponies and went tearing along, taking the lead of all the others, and going full gallop, he reached, by a short cut, the hill near the North Shinnecock Gate, and as the hounds crossed the road, he having had a view of the fox which was some twenty half a mile ahead. Some of the hunters coming up and seeing the Captain stopping, called out, "Well, Cap, what is the matter? Where is the fox?" Cap, grinding his teeth in disappointment, and remarking, "Curse him, he has got the woods, and the greville himself is coming up ahead of him now," which, however, did not prove true, as the fox, instead of running straight away, made a circle, which enabled them to get ahead, however, without doing injury to poor Reynard. After running in the woods some time he took a turn and ran through an open country back to Shinnecock Hills, entering them at the gate near the sheep fold, from whence he ran to the identical spot where Cap. Rose had stood so patiently waiting, his coming at the first part of the hunt. He then ran on to the woods, and covered with ice and water which destroyed the scent, and nothing afterward could be done with him, and the young hounds were not blooded.

Report says Ed. Jennings (who is a money-making farmer) has made a fox and practices shooting at it at seven yards distant, while his son-in-law attends to the farm.

G. W. W.

SOUTHAMPTON, LONG ISLAND, FEBRUARY, 1883.

**CHAMPIONSHIP OF THE WORLD.**—*Editor Forest and Stream.* The New Orleans Gun Club have done well in providing a stake for the winning dogs at Field Trials; but would it not be better to style the winner of that stake "Champion of America," rather than "Champion of the World?" The former title would name a greville himself; the latter title or nothing. How can a man assume that the latter title or nothing when there may be and probably are dogs abroad equal in every respect to his own? If the club sticks to the proposed name of the stake, would it not be a good plan to hold the trials in the State of North Carolina, County of Buncombe?—MEAT-HAWK.

**DOG COLLARS.**—A person unware of the number and variety of dog collars and trimmings manufactured, would be well to visit to the establishment of the Medford and Fancy Goods Company, formerly at 90 Duane street, but now in more commodious quarters, at 101 Chambers street, corner of Church. The business of this well-known concern has grown so largely the past year as to compel the change. They are now prepared to manufacture three times the amount of goods manufactured last year. The number of styles they make is almost endless, and the many different materials used astonishing. We advise our friends to call on the Medford and Fancy Goods Company, and can insure them a pleasant and profitable visit.

**ENGLISH FIELD TRIAL DERBY.**—The entries for the ninth Field Trial Derby of the Kennel Club closed January 1 with 145 nominations, eight more than last year. There are 82 setters and 61 pointers. Mr. R. J. Lloyd Price heads the list with eighteen entries, sixteen pointers and two setters; Mr. Barclay Field comes next with fifteen, eight pointers and seven setters. Mr. L. P. Lewellyn enters thirteen, all setters. The trials will be run next May.

**EASTERN FIELD TRIALS CLUB.**—There was not a quorum at the meeting on Tuesday evening of the Board of Governors of the Eastern Field Trials Club, and the meeting was adjourned to next Tuesday evening the 30th, when the committee on grounds for holding the trials will make their report.

**NATIONAL AMERICAN KENNEL CLUB DERBY.**—Remember that the entries for the National Derby will close March 1. Entry blanketed of the secretary, Mr. D. Bryson, Memphis, Tenn., or at this office.

# GELERT.

"For the want of something better," writes "Wells," "nor even half so good, I ask you to publish the following pretty and touching piece of verse, the production of Hon. William Robert Spencer, I have never seen it in your columns, and I feel sure some reader of your excellent paper will be obliged to me and to you for giving him an opportunity to read."

BETH GELERT, OR THE GRAVE OF THE GREYHOUND.

THE spearman heard the bugle sound,  
And cheerily smiled the morn,  
And many a brach and many a bound  
Obeyed Lewellyn's horn.

And still he blew a louder blast,  
And gave a lustier cheer;  
'Come, Gelert, come, never rest  
Lewellyn's horn to hear.

Oh where does faithful Gelert roam,  
The flower of all his race,  
So true, so brave, a lamb at home,  
A lion in the chase?

'Twas only at Lewellyn's board  
The faithful Gelert fed,  
He watched, he served, he cheered his lord;  
And sentinel his bed.

In sooth he was a peerless hound,  
The gift of royal John,  
But now no Gelert could be found,  
And all the chase rode on.

And now, as o'er the rocks and dells  
The chattering chidings rise,  
All Snowden's craggy chasms yells  
The many mingling cries.

That day Lewellyn a little loved

The chase of hart and hare,  
And scant and small the booty proved,  
For tielert was not there.

Unpleased Lewellyn homeward bled:

When near the portal stood  
His truant tielert he espied,  
Bouncing his lord to greet.

But when he gained his castle door,  
Aghast the chieftain stood;  
The hound, all o'er was smeared with gore,  
His lips, his fangs ran blood.

Lewellyn gazed with fierce surprise,

Unused such looks to meet.  
His favorite checked his joyful gait,  
And crouched and licked his feet.

Onward in haste Lewellyn passed,  
And on went Gelert too;  
And still whenever his eyes he cast  
Fresh blood gouts shocked his view.

O'erturned his infant's bed he found  
With blood-stained carpet rent,  
And all around the walls and ground  
With recent blood besprent.

He called his child—no voice replied;  
He searched with terror wild;  
Blood, blood he found on every side;  
But nowhere found his child.

'Hell hound, my child's by thee devoured,'  
The frantic father cried,  
And to the hill his vengeful sword  
He plunged in Gelert's side.

His suppliant looks, as prone he fell  
So ray could turn,  
But still, his Gelert's dying yell  
Passed never o'er his heart.

Aroused by Gelert's dying yell  
Some slumberer wakened nigh,  
What words the parent's joy could tell  
To hear his infant's cry?

Concealed beneath a tumbled heap  
His hurried search had ceased,  
All glowing from his ray sleep  
The cherub boy he kissed.

Nor scarce had he, nor harm, nor dread,  
But the sun's couch beneath  
Lay a giant wolf, all torn and dead,  
Tremendous still in death.

Ah, what was then Lewellyn's pain?  
For then the truth was clear,  
The gallant hound who he had slain  
To save Lewellyn's heir.

Vain, vain, was all Lewellyn's woe;  
'Best of thy kind, adieu!  
The frantic blow, which laid thee low,  
Thine heart shall ever rue.'

And now a gallant tomb they raise  
With costly sculpture decked,  
And marble stoned with his praise  
Poor Gelert's bones protect.

There never could the spearman pass,  
Nor fosterer unmoved,  
There, oft, the tear-bespinkled grass  
Lewellyn's sorrow proved.

And there he hung his horn and spear,  
And there, as evening fell,  
In fancy's ear he oft would hear  
Poor Gelert's dying yell.

And till great Snowden's rocks grow old  
And cease the storms to brave,  
The consecrated spot shall hold  
The name of Gelert's grave.

## KENNEL NOTES.

NOTICE TO CORRESPONDENTS.  
Kennel notes are inserted in this column free of charge. To insure publication of notes in correspondence MUST GIVE the following particulars of each animal:

1. Color.
2. Breed.
3. Sex.
4. Age, or
5. Date of birth, of breeding or of death.
6. Name and residence of owner.
7. Name of sire or dam.
8. Sire, with his sire and dam.
9. Owner of sire.
10. Owner of dam.

All names must be plainly written. Communication on one side of paper only, and signed with the name of the owner.

## NAMES CLAIMED.

See instructions at head of this column.  
*Lulu and Sheila.* By Mr. Fred W. Rothbar, Spring Creek Farm Kennels, Simcoe, Ont., for Scotch collie bitch, whelped Jan. 22, 1883, by Ch. Margus out of owner's imported Lassie.

*Bret Hart, Billy Taylor, Tully Tangle.* By Mr. Geo. W. Leavitt, Jr., Boston, Mass., for spaniel puppies (Beau-Queen). See sales.

*Comp.* By Mr. W. Kirk, Westchester, N. Y., for black and white ticked setter dog pup, whelped Nov. 17, 1882 (Dash III.—Bessie).

*Carver Bell.* By Mr. S. B. Dilley, Rosendale, Wis., for liver and white pointer bitch, whelped Sept. 1, 1882, by his Ranger out of White Lilly (Dime Queen).

*Clipper.* By Fulton Kennel Club, Canal Fulton, Ohio, for white, black and tan beagle dog, whelped Dec. 13, 1882, by their champion Boxer (Cameron's Boxer—Webb's Lady) out of their Lill (Warrior—Rosey).

*Reppell's Lady—Boyer.* The Fulton Kennel Club's (Canal Fulton, Ohio) white and tan beagle bitch Reppell's Lady (Boyer—Gossett), Dec. 17, 1882, four (two dogs) by owner's champion Boxer (four dogs) and one bitch since dead.

*Reppell's Lady—Boyer.* The Fulton Kennel Club's (Canal Fulton, Ohio) white and tan beagle bitch Reppell's Lady (Boyer—Gossett), Dec. 17, 1882, four (two dogs) by owner's champion Boxer (four dogs) and one bitch since dead.

*Reppell's Lady—Boyer.* The Fulton Kennel Club's (Canal Fulton, Ohio) white and tan beagle bitch Reppell's Lady (Boyer—Gossett), Dec. 17, 1882, four (two dogs) by owner's champion Boxer (four dogs) and one bitch since dead.

am inclined to think the old felt a tree and get in ball and then a few consecutive slides on five-inch string! I know it never was made before by any rider and I think it is the best of the kind ever made, excepting, and I think so, the one I can begin to feel about I should like to "qualify" myself in. I have made a few other fractions of the coming team myself. As to the coming gun, I have not yet decided.

CAMDEN, N. J.—An interesting shooting match was held Feb. 14, at the club rooms of the Princeton Social, at Camden, N. J., by the members of the Orange Gun Club. There was a large crowd of spectators and good and poor sights. Distance, 187 ft. The target of honor was a large one. Shooting at a pin's head, the best shot being 15 in. from pin, the following: 1st, Jos. H. Huggins; 2d, A. Weaver; 3d, C. Wenz; 4th, H. C. Thompson; 5th, H. Stein; 6th, E. H. Stein; 7th, W. Stein; 8th, L. H. Stein; 9th, A. Meyer; 10th, J. H. Huggins; 11th, J. H. Huggins; 12th, L. H. Stein; 13th, L. H. Stein; 14th, A. Meyer; 15th, J. H. Huggins; 16th, J. H. Huggins; 17th, J. H. Huggins; 18th, J. H. Huggins; 19th, J. H. Huggins; 20th, J. H. Huggins. There was also presented with a leather medal. There was a winning between two teams, W. Stein, Jr., being captain of one, and E. H. Stein, Jr., being captain of the other. The following were the winners: 1st, E. Wenz; 2d, J. H. Huggins; 3d, J. H. Huggins; 4th, J. H. Huggins; 5th, J. H. Huggins; 6th, J. H. Huggins; 7th, J. H. Huggins; 8th, J. H. Huggins; 9th, J. H. Huggins; 10th, J. H. Huggins; 11th, J. H. Huggins; 12th, J. H. Huggins; 13th, J. H. Huggins; 14th, J. H. Huggins; 15th, J. H. Huggins; 16th, J. H. Huggins; 17th, J. H. Huggins; 18th, J. H. Huggins; 19th, J. H. Huggins; 20th, J. H. Huggins.

Worcester, Mass., Feb. 8. There were not as many out on the weekly meet of the Worcester Rifle Association, at Pine Grove Range, to-day as usual. The wind was strong and variable. The scores for

THE TRAP.  
THE CHAMPIONS AT LOUISVILLE.

1808, but for eighteen years prior to that date he had been leading a busy life on the prairies south of Chicago as a practical field and game warden. He had been a hunter since his boyhood, and in 1808, for the first time, he was engaged in a match from traps in a sweepstakes market. The match was won by George Stanton, of St. Louis, and his success was so great that a match was made with George Stanton, of Detroit, for \$300 per side. The match was at fifty birds, shot in the morning, and George Stanton won. He next met Abraham Kleemann, and was defeated, but shot again and defeated him. In the spring of 1862 he made a match with Bill pigeons in the morning, and won with 717 birds, and in the afternoon shot a woodcock with a single muzzle loader. He then went to kill 100 birds straight. This was done at Chicago, July 21, 1862, and later, at Detroit, he killed fifty-three birds in twenty minutes and then, later, he shot a woodcock with a single muzzle loader. He was again engaged in a match from traps, and won. He was again engaged in a match for \$1,000 per side against King, of Chicago, was

Nathan Dowie, G. K. Fayette and J. J. Kleumann were successively beaten in various styles of matches, and at Detroit, in the fall of 1870, he met Ira Paine upon the trap for the first time, and beat him in a match for \$400 per side. Paine at this time had a diamond-shaped badge which he had won in the East, and for this Bogardus challenged him, the match coming off on Jan. 25, 1871, at the grounds of Hiram Woodruff, Long Island. Paine killed 88 to Bogardus's 8. This match was the first use of a breech-loader by Bogardus.

[illegible]

of his abilities in this section of the country. On Dec. 12, 1877, he wrote from San Francisco a challenge which was published in the *San Francisco Chronicle* and was answered by the *San Francisco Herald*, thus, on Jan. 6, 1878. Nothing came of it, however, and when Carver came East his shooting was entirely with the rifle, and his doubt as to the accuracy of the revolver was confirmed. He was disappointed from what had been shown by previous shooters that he was a great attraction. He had a number of exchanges of challenge letters with the *San Francisco Chronicle* and the *San Francisco Herald*, the Astor House and agreed to have a six-day contest, 20,000 glass balls, Bogardus to use a shotgun and Carver a rifle. The contest was to be held at the Astor House and the match was to take place during the latter part of the year when Carver expected to be back from Europe. He shot a match with Bogardus and was disappointed in the result. He was breaking them easily with the rifle. Abroad he has displayed his skill from one end of Europe to the other, knocking over grouse and partridges with the rifle, and deer and wild boar with the shotgun, and with Austrian magnums. He has shot before royalty in a dozen countries, and suffered somewhat of what is antichristically said

**LAUNCHED.**—Wallin and Gorman have launched a sloop of the following dimensions. On deck, 37ft. 6in.; load line, 44ft.; beam, 14ft.; depth, 11 ft. 10in.; draft, 12ft. Mast, deck to cap, 31ft. 6in.; topmast above cap, 5ft.; hoist of mainsail, 30ft.; boom, 35ft.; gaff, 19ft.; jib, 26ft. on foot.

**IN TREPID.**—This schooner, Mr. Lloyd Phoenix, N. Y. Y. C., was reported at Port-au-Spain, Trinidad, Jan. 20, intending to leave Feb. 2 for Granada, St. Vincent, St. Lucia and St. Thomas.

### METALLIC SPLICING.

THE usual method of splicing wire is in imitation of the practice pertaining with rope. The splicing, if well done, is strong enough, but never perfectly reliable, so much depending upon the workmanship. Objections are the time consumed, the waste of wire and the difficulty of making repairs away from a regular rigging establishment. This last objection is the most serious to owners of yachts, as their seldom command the ability or tools to effect repairs, except in a temporary and crude way, and such repairs are seldom to be trusted, often involving new rigging to make up for the loss of length incurred by the attempts of the crew. The new metallic splice is put on the market to overcome the inequalities of "unlaying and sticking." It can be recommended for durability, economy of time and material, neatness and the facility of application and removal. It is practically indestructible by any ordinary usage or exposure.

No repairs are needed, and when a rope is worn out the socket may be easily removed and used on new rope. This is a marked advance over the old style splice which requires the frequent attention of a competent rigger to repair or renew the coating or service of tarred hemp, which, without such care, soon becomes worthless either to hold the splice together or to keep water from going into it, thereby causing rust, expanding the hemp core and spreading the splice laterally and destroying it.

There is a large saving of rope by this method, as none is required to go around thimbles or dead-eyes; none is used for tuckling; none to trim off, and in fact no rope is wasted and no hemp service is required either to strengthen or to protect the splice. For ship use no chafing gear is required, as the socket is a smooth metal which will neither chafe nor be chafed. No repairs are required. The time taken to fasten the rope may be safely stated as less than one-fourth of that required to make and finish the old style splice.

The arrangement is simple to describe. The wire having been cut to the required length, the end is inserted in the socket cast in one of the various fittings used in rigging, such as eyes, hooks, hearts, fair leads, etc., and there secured by pouring a strong fusible metal around it, completely filling all the spaces in and around the rope, and forming a perfectly solid and thoroughly united structure which no strain can break, as has been amply proved by a great number of tests made at the U. S. Arsenal, Watertown, Mass., and several other places; and also by practical use on shipboard.

This invention is likely to work important changes to the manner of rigging yachts of all kinds, from the fact that these sockets may be terminated by any kind of device or fastening commonly used in connection with wire rope, for which purpose the Metallic Splice Manufacturing Company have brought out many useful and neat patterns, among which we have selected the principal ones for illustration.

The socket cast in one with the fittings is made with care and always cylindrical inside, as shown by the sectional cut of an ordinary eye herewith presented. The socket was first cast conical, but subsequent experiments showed a cylindrical hole all that is necessary, since the wire rope invariably swells away before the splice or welding would "take." Notches or heels shown in the illustration are not even necessary, for perfect fusion takes place between the wire, filling and surrounding casting if the directions are properly followed. These are within the comprehension of every one, as appears from the following: Pure tin, or a compound of half lead and half tin. Either of these may be used with the utmost safety, and are obtainable in any part of the world.

#### DIRECTIONS FOR MAKING THE PATENT SPLICING.

First—Melt a sufficient quantity of filling metal.

Second—Measure the depth of socket, and cut the same length from the hemp heart of the rope.

Third—Insert the end of the rope to be spliced into the socket, and hold in a horizontal position over a strong heat until a piece of the filling metal will melt, when held on the upper side of socket, and passed over the length of this heat, the required length of the rope or largest part of the socket, and until the rope becomes too hot for the hand at the distance of six inches from the socket. Have the filling hot enough to ignite a shaving or piece of paper when brought in contact with it.

Fourth—Place the splice with the rope inserted in an upright position and pour the socket full of metal; it may be cooled gradually with water, when it is ready for use.

Any apparatus for melting the metal and heating the parts may be used, but the manufacturers have perfected a light and portable furnace and melting pot, which heats the metal very quickly, and renders the process of splicing very simple and expeditious. These furnaces are furnished to owners of the splice, and are found useful in many different ways when a moderate or powerful heat is wanted temporarily or constantly.

It is our intention to publish testimonials or endorsements here,

except as necessary to assure persons likely to use the splice, that it has been put through well authenticated experiments before competent experts, and that no risk attends the introduction of a method of splicing we regard as a great improvement upon existing customs. The general results of the experiments are set forth in the subjoined table obtained before a board of U. S. naval officers at the Watertown Arsenal, Aug. 22, 1884.

SOCKETS.	STEEL WIRE ROPE.	ULTIMATE STRENGTH.
Valuable Iron.	Two inch.	20,000 lbs.
"	Three "	15,000 "
"	Four "	13,000 "

The rope was broken in every case, and the splices were unimpaired.

The following is an extract from a report of tests, made to Commander O. H. Badger, commanding the U. S. Navy Yard, Boston, Mass., March 31, 1882:

"Commodore—in obedience to your order of the 19th inst., we have examined and witnessed the testing at Watertown Arsenal of the patent fusible wire socket splice presented by W. P. Healey. In one case a five-eighth iron rod—Norway iron—was inserted in the socket, the rod parted and the splice remained intact. By the request of the board two ends of wire rope were put together, and the socket splice put on similar to two ends of a shroud, being shot away and put together, and the rope was broken in each case. The rope was broken each time, the splice remaining good. (A splice of this kind does not shorten the rope.)"

From the results of the tests we are of the opinion that if the sockets and splices are carefully made, and a sufficient space given in the socket to allow the metal to go freely to the bottom and penetrate the wire spaces, that it will more than stand the strain of the rope. It is also more durable and economical than the old method of splicing.

(Signed) C. C. CARPENTER, Captain U. S. N.  
J. T. SYMONS, Lieutenant U. S. N.  
J. B. AIKES, Boatswain U. S. N.  
M. H. WEBSTER, Supt. Rope Walk.

The strength and reliability of the metallic splice is therefore not open to doubt. Its neatness and advantages will be readily appreciated by the reader. Hon. Benjamin Dean, owner of the well known sloop Cadine, of Boston, who tried the arrangement on his yacht, has the following to say:

Boston, September 14, 1881.

Supt. Metallic Splice Manufacturing Co.—I am much pleased with your Metallic Splice. It is the nearest thing possible, and secures the entire strength of the rope. Nothing could be better.

Yours, very truly, BERT. DEAN.

Splicing is given by the captains of pilot boats and the owners of vessels generally, so we deem ourselves warranted in aiding the introduction of the splice throughout the yachting fleet. We have at our office a sample, cut across in several places, demonstrating the complete welding of all parts in a single mass.

The only caution required is to follow absolutely the directions with regard to heating the socket, the object being to cause contraction of the surrounding iron as the filling metal cools. No skilled expert called for, any builder or carpenter or boat sharp can accomplish thorough work in much less time than they could with the old tuckling process. Owners of small boats can doctor their rigging without the trouble of carrying it to a rigger's loft and paying high price for trifling repairs.

The various sizes of sockets are known by numbers, and suited to rigging according to the circumference, which may be taken as equal to three times the diameter and a trade over. The amount of filling metal is small and the cost purely nominal, being only 24lb. for a socket 3/16 in. internal circumference. Among the yachts fitted with the metallic splice may be mentioned the schooner Fox, new of New York, the schooner Meteor, the sloop Cricket, built by the Woods Bros., of Boston, for Mr. Mott, of Oswego; the Glam, of V. King, of Boston; the Chama, M. Driscoll, and the Phantom, of the same place. Also the sloop Blanche, T. C. Lyman, of New York, and the Undine, before noted. Quite a large fleet will be similarly supplied this year, as builders generally are giving the new method their preference. The accompanying illustrations explain themselves. They include the common "round eye," useful for many purposes, and a general substitute for eye splicing in all parts of a ship. The dead eyes are neater, stronger and lighter than those of lignum vitae. The "leg sockets" or "hearts" are adapted to setting up bowsprit shrouds, boscayers, and smokestack guys. The sister hooks are familiar in their application to all.

Other cuts illustrate the breaking of the wire before the splice

drew during a trial test. With such handy appliances, yacht owners will be able to find many occasions to work them in to advantage where at present they refrain on account of the trouble and difficulty involved in the old method. Double sockets for joining two ends are also manufactured, so that a break can be overcome without shortening the rigging, by sticking the ends as formerly required. The means for quick repairs, alterations or additions are to be found aboard even the smallest of boats, so the work can be all done aboard ship with a few spare sockets in stock among the boat-sailor's stores. We refer those interested for further information to the Metallic Splice Manufacturing Company, 55 Oliver Street, Boston, from whom samples may also be obtained.

### STEAM YACHTS.

BESIDE a lot of wired, half-browned, ill-shaped launches dubbed "steam yachts," we have few, if any, regular steam yachts deserving the appellation. The sausage-shaped things, so low in the waist as to be quickly swamped in rough water, and surrounded by fragment houses with a couple of bean poles for rig are at best to be classed as launches which have come into vogue on the strength of their supposed high speed. Nine out of ten of them, however, can lay claims to nothing of the sort, and if not for speed conveyance up and down rivers to suburban residences, their right to exist may fairly be questioned. With the exception of the Herreshoff yachts, these steam launches with their ungainly form, dangerous precocities, clumsy, antiquated boilers and tea engines, are lamentable failures in respect to high speed. Lacking in the only quality justifying their existence, they are worthless toys of no use or value. The cruising steam yacht affording a floating home, and able to make a passage to any parts at reasonable, even maintained speed upon the lowest coal consumption, and the smallest engine space, is one of those luxuries not yet existing in our waters, and in fact scarcely understood in her prints of excellence, and seventy-five to seven hundred tons in British waters we have as yet no counterpart. That they will compass an important element in the near future can hardly be doubted when we keep in mind their fast increasing popularity abroad, and the wide range of their usefulness. Such fresh-decked screw yachts as we have so far built, are to a great extent reproductions of the little launches on a larger scale, and with two or three exceptions, their excessive consumption, and large engine space render them unsuitable for cruising and voyaging purposes. Of the class of oceanic cruising steamers the English and Scotch have so long made a specialty that their designs will naturally be sought to fill the lack of our own experience. Those in search of the latest practice are directed to the ripe knowledge and close familiarity with the subject for which naval architects like Mr. St. Clare Byrne, of Liverpool, have well-established reputations. In applying to his professional ability, gentlemen contemplating the construction of steam cruisers will certainly fare vastly better than by studying the little in the dark, leaving to carpenter and blacksmith the intricacies and neat balances of size, power, rig and accommodations. The clumsy attempts at originality now existing in our waters prove how farlie it is on the part of even our best engineering establishments to reach at a single bound upon first attempt the maturity in plan and the nicety of detail which can only be acquired by gradual approaches through many years of time and the closest attention. We are induced to give this warning, because we hear of a cruising steam yacht about to be designed and built by a concern which has never turned out anything of the kind, has no one in its employ who ever stepped aboard such a vessel, and who know nothing of a cruiser's requirements in detail. Designers of steam yachts are in need of specialists, and to renounce their advice and knowledge in favor of the overbearing confidence of a bureau agent in search of a commission is to insure failure from the start and another danger upon the introduction of steam cruisers.

MEASUREMENT IN GERMANY.—After discussion of the systems in vogue the North German Sailing Union has decided to adopt "bulk measurement," and has voted the funds necessary to carry the system out in practice. An official measurer will be selected, whose expenses will be covered by the union. Expert engineers and army officers, took part in the deliberations, and their support of bulk measurement is strong evidence of its equity. There is nothing unscientific in their conclusions, nor if they build upon false assumptions and prejudice like certain young club men here. The clubs at Hamburg, Stettin, Dantzig, Kiel and Berlin are included in the union. The Royal Copenhagen, of Denmark, now measures by displacement, but as the evil tendencies of such a custom in producing shoddy, dangerous yachts is already becoming apparent, the Danish yachtsmen are likely to follow the lead of the Germans soon.

# HUMPHREYS' HOMEOPATHIC VETERINARY SPECIFICS

OR THE CURE OF ALL DISEASES OF HORSES, CATTLE, SHEEP, DOGS, HOGS, and POULTRY.

FOR TWENTY YEARS Humphreys' Homeopathic Veterinary Specifics have been used by Farmers, Stock Breeders, Livery Stable and Farmmen, Horse Railroads, Manufacturers, Coal Mine Companies, Trav'g Hippodromes and Menageries, and others handling stock, with perfect success.

Humphreys' Veterinary Manual, (200 pp.) will be sent by mail on receipt of Five Cents.

## FISHING IN American Waters.

BY GENIO C. SCOTT.

New and Revised Edition, with additional chapters on Southern and Miscellaneous Fishing, etc.

ILLUSTRATED WITH MORE THAN TWO HUNDRED WOOD ENGRAVINGS.

This book is the recognized Standard authority for American Anglers and Fishermen, embracing Coast and Estuary Fishing with Rod and Line.

Fresh Water Fishing with Fly and Bait. Natural History of American Fishes. Lake and Coast Fish and Fisheries. Southern fishes and How Angled for. Cookery Adapted to the Resources of Sportsmen in the Wilderness or on the Ware, etc., etc.

One volume, 330 pages, 298 engravings. Handsomely bound in extra cloth. Price \$2.50.

Published and sent postpaid on receipt of price by

THE AMERICAN NEWS COMPANY, NEW YORK.

Illustrated Price List of Books relating to Sport and Rural Life sent on application.

## The English "Fishing Gazette."

Devoted to angling, river, lake and sea fishing, and pisciculture.

Every Friday, 10 pages, folio, price 4d.

Volume VI. commenced with the number for January 7, 1892.

Editor—R. B. MARSTON

Free by post for one year for 12s. 6d. (say \$3.20) to any address in the United States.

Sent direct from the office for any portion of a year at the above rate. U. S. postage stamps can be returned, or money order payable to Sampson, Low, Marston & Co., the proprietors.

Contains special articles on all fresh and salt water fish and fishing; reports of the state of the rivers; reports from angling clubs; pisciculture and natural history; where to fish; angling notes and queries; angling exchange column; notices of fishing tackle, books, &c., and other features.

A copy of the current number can be had (post free) by sending six pence in stamps to R. B. Marston, the FISHING GAZETTE office, 12 and 13, Pettex-lane, London.

The FISHING GAZETTE circulates extensively among anglers and country gentlemen in all parts of the Empire.

"There is a large public interest in fishing. . . An excellent class organ."—*World*.

"One of the best authorities on these and kindred subjects."—*Truth*.

"A brighter and gayer little paper is not published."—*Magazin*.

The FISHING GAZETTE is quoted by the *Times* and all the best papers.

One of the best mediums for

ADVERTISEMENTS

of fishing tackle makers, fishermen, hotels and fishing quarters, whiskey, waterproof fishing goods, cigars and tobacco, books of angling, and all other requirements of anglers; also for general advertisements addressed to a well-to-do class in all parts of the country and abroad.

Office—12 and 13, Pettex-lane London

STODDARD'S

Map of the Adirondacks.

The best and most complete map of the Adirondack region ever published.

PRICE, POSTPAID, \$1.00.

## Kynoch's Patent "Perfect" Brass Shells

MANUFACTURED BY

Kynoch & Co., Birmingham, Eng.

These shells are made of extra fine thin pliable metal, with reinforced base. Use either Winchester or Wesson primers. Can be reloaded as often as any of the thicker makes. Cost only about half as much. Weight less than paper shells, and in consideration of their reloading and other advantages, are really cheaper than the paper. They also shoot stronger and closer, and can be loaded heavier, as inside diameter is nearly two gauges larger. They possess a great advantage over all other brass shells, as owing to the thin metal they can be closed as represented in cut by simple use of the thumb or fingers, and straighten out to original shape when discharged. These goods have already gained a wide and favorable reputation in Europe, and in the opinion of many prominent sportsmen will soon supersede to a great extent the old style of both brass and paper. Samples will, upon application, be mailed (without charge) to any sportsman's club or dealer, and prices quoted to the trade only. For sale in any quantity by gun dealers generally, or in case lots only (2,000 shells) by

HERMANN BOKER & CO.,

SOLE AMERICAN AGENTS,

101 & 103 Duane Street, New York.

WILLIAM READ & SONS, Boston, Mass., Agents for New England States.

We also carry a large stock (at all seasons) of Kynoch's regular thickness brass shells, adapted to the Berdan Primer. Price materially lower than the American make of same quality.

B. F. NICHOLS & CO.,

BOSTON, MASS.,

Manufacturers of

HEXAGONAL SPLIT BAMBOO FISHING RODS,

REMOVED TO 153 MILK STREET.

We are obliged to have more room in our factory and greater facilities for manufacturing our goods to meet the increasing demand. We have received the highest award and silver medal at the Massachusetts Charitable Mechanics' Association Fair for our superior goods. Send for catalogue.

C. B. WILKINSON,

8 John St., near Broadway, N. Y.

## GEORGE DAWSON.

GEORGE DAWSON died at his home in Albany, New York, last Saturday morning, after a brief illness of less than a week.

His death brought to its close a long and active life, well rounded with usefulness and honor. Mr. Dawson had almost attained the allotted three score years and ten, and had retired from active life to spend a well-earned leisure in the companionship of his chosen books and many friends.

George Dawson was born at Falkirk, Scotland, March 14, 1813; and when three years old came to this country with his family, living first in New York City, and afterward in Toronto, Canada. At the age of eleven, in 1824, he entered as an apprentice to the printing trade in Niagara Falls, Canada. In 1826 he went to Rochester, New York, and there became an employee of the late Thurlow Weed, and in 1831, Mr. Weed having established the *Albany Evening Journal*, Mr. Dawson became foreman of the printing office. This position he held, meantime reporting the Legislature proceedings, and doing other work upon the paper, until, in the spring of 1836, he was called to the editorship of the *Rochester Daily Democrat*. Thence, after three years, he went, in August, 1839, to the editorial management of the *Detroit Daily Advertiser*, where, in return for his services to them, the Whigs made him State printer. In 1844 a fire destroyed the establishment, and Mr. Dawson returned to Rochester, and again became the editor of the *Daily Democrat*, which position he held until 1846. At the invitation of Mr. Weed he became an associate in the editorship of the *Albany Evening Journal*, of which he became senior editor and proprietor upon Mr. Weed's resignation. In the history-forming years that followed, Mr. Dawson's position was one

of great influence. He wielded a sharp, incisive pen, and through the *Journal* moulded public opinion in the great crises of the day. In the arduous duties of his editorial management Mr. Dawson did the best work of his life, finding brief rest and recreation in his favorite pastime of angling. In March, 1877, he retired from the active management of the *Journal*, and devoted himself to the pursuits of a leisure well earned. In 1879 he again took up the pen and assumed control of the *Journal*, relinquishing it in September of last year. The life we have thus briefly outlined was a busy and influential career. But like many another man born with a love for the beautiful things of nature, Mr. Dawson found time—or made it—to gratify to a normal extent his tastes for out-of-door life. His summer vacations were spent in the woods, in the companionship of chosen friends of like spirit, and in a communion with nature, from which he returned each year renewed in mental strength and vigor, and, like the Norse heroes of old who ate of the magic youth-restoring apples, young again in years.

Mr. Dawson was one of "the simple wise men who love to go fishing." The pastime was a passion with him, and few men could write of its charms with more appreciation or more delicately. His annual angling trips were described in the *Journal* in several series of letters, fragrant with the fresh, spicy odor of the North Woods and the Canadian forests. In 1879, after returning from his thirty-fifth annual trip to angling waters, he collected several of these letters together into a handsome volume entitled "Pleasures of Angling with Rod and Reel for Trout and Salmon," a book which has taken its place among the classics of this literature.

Among his angling friends and camp companions were many of the distinguished men of the day, President Arthur, ex-Vice-President Wheeler, ex-Treasurer Spinner, Senator Edmunds, Secretary Folger, ex-Governor Seymour, Chief Justice Ritchie, of New Brunswick, and Chief Justice Gray of the Supreme Court. Of his days in camp with these friends some pleasant chat was given in the "Winter Talk," published in the *FOREST AND STREAM* of Dec. 21 last.

When Mr. Dawson retired from his editorial duties last fall he expressed to the writer the pleasant anticipation of devoting himself to more congenial occupations, and shortly thereafter he began the series of charming "Winter Talks on Summer Pastimes" that have given so much pleasure to the readers of this journal. These essays are believed to be the last of his writings, and in them will be found the reflection of "the calmness of spirit and a world of other blessings attending upon it," which were the crown of a well-spent life.

## THE PARK AND THE SENATE.

THE Senate of the United States is displaying a strange apathy in regard to a matter of such vital importance as the preservation to this country of the Yellowstone National Park. The time has come for the members of the Senate to give some attention to the subject. They are apparently over-awed by the impudence of the would-be Park grabbers, who in the very face of the action of the standing committee of the Senate and without any lease, have gone on cutting down timber in the Park, killing game and erecting a hotel, as if they were above Congress and the people. This unblushing conduct calls for prompt attention.

Last Saturday, Senator Vest offered a resolution for the appointment of a committee of Senators to report to the Senate at the next session what is the actual condition of the Yellowstone National Park, what action has been taken by the Department of the Interior in regard to the management of the Park and the leasing or contracting to lease any part of it, and what legislation, if any, is necessary to protect the timber, game, and objects of curiosity, and to secure the proper administration of justice therein.

The resolution also requests the Secretary of the Interior to take no action in the matter of leasing or contracting to lease any portion of the Park for any purpose until the Committee shall have reported, to cause the cutting of timber and the erection of hotels to be discontinued, and to take immediate steps for the protection of game and objects of interest, and to call upon the proper military authorities for this purpose.

The resolution went over to Monday, and was then put off again, to come up when they get through with the interminable Tariff bill. It is very evident, as it has been from the first, that the monopolists have a strong lobby. We hope that Senator Vest will compel the friends of the Park schemers to show their hands.

## THE CHICAGO GAME MARKET.

A BILL now before the Illinois Legislature provides that the open season for selling game shall be extended to February 1. This bill is being pushed for the benefit of the game dealers, and is most decidedly against the interest of game protection. The circumstances are these: The Illinois law now permits the sale of grouse to December 5, and of quail to January 5; this allows five days for the sale of game after the season for killing it has expired. This is all the time that can reasonably be asked or wisely granted. But it does not satisfy the dealers, and they have set about securing a change.

Their first step was the organization of a Sportsmen's and Game Dealers' Association, in which it is needless to say the latter class, who appear to have shrewdly originated the scheme, hold a controlling influence. At the same time, by making it appear that the association is a sportsmen's society, they count on winning the concessions to their demands, which, as simple game dealers, they know they could not do. The present bill is fathered by this unequally yoked team of sportsmen and marketmen.

There are many good and sufficient reasons why such a bill should be opposed by honest advocates of game protection. It is an axiom that so long as there is a market for game so long will it be supplied to the market, legally or illegally, by fair means or foul. The sale of game ought to stop when the season for killing it expires; a period of five days, as now provided by the Illinois law, is ample time to dispose of the supply on hand. If not, then let the supply be less. If the season for killing game in Illinois is extended to February 1, the sportsmen of that State may make up their minds to the fact that game will be killed to February 1. There is no reasoning that fact out of the way.

Such an extension of the selling season would be alike disastrous to the game interests of other States. So long as the Illinois game dealers, during the close season, could sell game received from other States, or game from their own State under pretense that it had been shipped in from somewhere else, they were content with the old law. But the Wagner decision cut off this privilege. If the selling season is extended to February 1, the Chicago market will be flooded with game illegally killed in Michigan, Minnesota, Iowa and Wisconsin. Indeed, such is now the case.

It appears that through the influence of their association the game dealers have this year secured immunity from the law, and have been selling great quantities of game illegally killed in other States. One case in point has just come to our knowledge. It shows most clearly, first, that an open Chicago market means wholesale and illegal destruction of game in other States; and, second, that Chicago game dealers, who are also members of the Sportsmen's and Game Dealers' Association, have no scruples whatever about selling such game, provided only that they can put the proceeds into their pockets and escape arrest.

On the 22d of last January Mr. R. W. Matthews, of St. Paul, Minn., telegraphed to an ex-president of the Illinois State Sportsmen's Association that a large number of pinnated grouse had been, in defiance of the law, shipped from Osakis, Minn., to Bond & Ellsworth, game dealers, of Chicago. But instead of taking any steps in the matter, the recipient of the letter handed it over to the head of the firm against whom complaint was made, who is, by the way, the president of the Sportsmen's and Game Dealers' Association. A reply from this gentleman went back to Minnesota that Chicago game dealers were selling game in the close season, and proposed to sell it up to February 1st, and that the sportsmen had pledged themselves to stand to one side and make no prosecutions. So the dealer received and, presumably, disposed of the goods which, according to the laws of Minnesota and of Illinois, were contraband.

This is only one case among hundreds and thousands of the same kind. It shows how little sincerity there is in the game protective pretensions of the parties implicated; and it should be a warning to the sportsmen of Illinois to guard their interests as now secured by the present law.

The Chicago marketmen plead that if they do not sell game in the close season others will. This is the silly casuistry of men of the world over who can find no valid excuse for engaging in business of doubtful morality. Because the New York and Boston markets are open is no reason why the Chicago market should be added to them and the illegal traffic in game thereby increased. They ought not to be closed when the killing season expires.

For the sake of the Illinois game supply, and of that of neighboring States, true friends of protection will regret to see any such opening of the Chicago market.

## THE RIFLE SEASON OF 1888.

WITHIN a few weeks the clearing up of the ranges and the settling of the weather will enable practice to open before the target, and the work of the shooting season of 1888 will be on in full force. It promises to be a brisk season for those interested in rifle improvement, and in official military and amateur civilian circles as well, there is a desire to see progress as well as mere relaxation and enjoyment.

The great event will be the International match, and to secure a creditable showing in this every effort should be bent. There must be no such disgraceful fight against the odds encountered in the last contest. The team of 1883 must not be sent out to any such sure defeat, and it certainly looks as though they were to have choice of some excellent weapons.

Of course it will be a very agreeable outcome of the contest should victory come home with the visiting team, but the match can have only a good effect, at any event, in so far as it points attention to the matter of non-cleaning matches. They are to be the contests of the future in the line of practical rifle practice, and there could be no more instructive series of experiments at Creedmoor than comparative tests with the ordinary military rifles in prolonged series of shots without cleaning. A rifle which becomes useless from leading or jamming, or stripping of bullet patch under such trials, is not worthy of support as a desirable weapon. It does not come up to the requirements of a military arm, where oftentimes it is necessary to have shot after shot for long periods fired, and often very rapidly, too, where cleaning is entirely out of the question. If the arm shoots the more wildly the more it is fired in this way, it very soon becomes a mere stick, and is no better than a quarter-staff or policeman's billy. There would be an added pleasure to target practice if the marksman could be certain that in ridding himself of the labor of cleaning his rifle bore he was not at the same time placing himself under a heavy handicap. It must not be inferred that the practice of ten years past on American ranges, where so much attention was paid to cleaning, was misdirected practice. The results obtained were valuable, and make the building of a non-cleaning rifle a comparatively easy task. There is to be no general overhauling of the construction, but by care in a few minor points it will be found that any good shooting weapon under the present system will be serviceable for prolonged shoots without cleaning.

If in place of offering for prizes for the marksman who may hit the best score in a match under our present rules, the N. R. A. should encourage original experiments and carefully tabulate the results obtained under certain known and defined conditions, something could be accomplished in a single season which it would require a dozen years to reach under our present haphazard system. In all reports of rifle matches as now given there are so many omissions that the records are of little value as guides to riflemen wishing to improve their own practice. A single score might serve as the text for a very complete lesson of practical rifle shooting, but if the only point aimed at in publication is to designate differences between individuals, then the system now in use is a good one and answers every purpose. Progress, however, is not to be made by years of this sort of work. The experimenter is the leader and there is no reason why the several clubs of the country and organizations generally should not devote some time and attention to securing and tabulating results in these systematic endeavors to overcome some of the present impediments in the way of good and reliable scoring at all times.

It is time, too, in military practice that, there should be a general exhibit of what is and has been done. The regular army has made great progress since rifle practice was taken up a few years ago, and it is to be hoped that with the carrying out of the wise suggestion for the concentration of the troops and the breaking up of the present series of detached posts something may be accomplished in the direction of rifle improvement. In the militia it would be wise if a uniform system of scoring could be introduced so that the relative standing of the men of the several States could be readily fixed, and especially the fact brought out in strong relief that in many parts of the Union absolutely no attention is paid to building up this strong arm to the civil power of the body politic.

It is one of the difficulties of this sort of target practice that it must be kept up under the guise of a pleasure. It must not be made too irksome as a task, for there it is thrown aside as a bore, and all interest in it ceases. It will not do for the authorities to insist upon men making up for the defects of an inferior arm by extra practice and precaution. The best weapons should be secured, and then can the best result be insisted upon from the men into whose hands the rifles have been placed. In this respect the militia of several of the States have been very just cause for complaint, and it is not at all surprising that some lively grumbling should at times be indulged in.

It is probable that this year will see some interesting experiments in the direction of repeating rifles for military uses. It is an open question whether for sporting rifles to be used in hunting there is any legitimate demand for a magazine rifle, but in military circles it is recognized that the morale of a body of troops is wonderfully strengthened by having them armed to the very highest point of excellence,

and competent experts are working in the direction of magazine rifles with great determination. Much has been done abroad, and most excellent results have been shown on this side the ocean; but there is the service test to be yet applied to many of the models put up for trial.

It would be well if the season of 1888 should see a more general diffusion of rifle shooting, and the sport become popular in all quarters of the country. If for every one of the thousands upon thousands of little pistol plagues which are scattered in every quarter, a good weapon was made and put in careful use, we should have a big decrease in accidents from firearms. To infer from the number of fatal shooting occurrences that small arms are *per se* responsible is most absurd. Carelessness, ignorance or design come in to explain the mishap in fully ninety-nine per cent. of the cases reported. If the season of '88 will see more intelligence on the questions of petty arms scattered among the people, it will see a corresponding reduction in the number of shooting accidents.

**NETS IN LAKE CHAMPLAIN.**—We would call attention to the article by Dr. C. Hart Merriam in another column, in which he shows how the valuable food fishes of Lake Champlain are slaughtered on the Vermont side of the lake while seeking their spawning grounds. A year ago one of the New York game protectors complained in our columns of this same thing, and regretted that he was powerless to remedy the matter. The greed of fishermen in all parts leads them to try to capture the last fish in the waters in order to make as much out of them to-day as is possible and to neglect the future harvests. We hope some action may be taken by the authorities to prevent the annual March slaughter this year, and thus secure a fair crop of young fish the coming season. If the fishermen took the fish after they had spawned it would not be so bad, but according to Dr. Merriam they are doing all they can to exterminate the fishes of the lake, whose main spawning grounds seem to be upon the Vermont side.

**"ASLEEP AT HIS POST."**—Had the artist chosen to tell his story in prose, instead of by a sketch, it would properly have been placed in our Camp Fire Flickerings. The picture is suggestive. The hero is by no means the only unfortunate sportsman who has, by falling asleep, missed one of the golden opportunities of his life. A similar experience has befallen others. We recall an occasion when a fox hunter (New England style), overcome by fatigue, fell asleep at his stand. When he woke to find that the fox had passed within six feet of him, he delivered an oration to himself and the other stumps, which, though eloquent in the extreme, our limited space will not permit us to repeat here. To his friends it was plausibly explained that the fox had been missed because his gun had hung fire; the real truth has never been told before, and it is now given to the reader only in the strictest confidence. May we not ask in return a like confidential relation from some one else?

**THE LOCAL PRESS** may be utilized to further the interests of sportsmen if a little attention be given to the matter. The local editor is, in nine cases out of ten, willing to give his influence to the cause of game protection, provided only that his attention be properly called to the subject. How clearly and truly the local press can talk, witness the words of the Huron (Dakota) *Leader*, reproduced elsewhere. With such an ally as the home paper, the sportsmen of a town or county can accomplish a vast amount of good.

**THE MAINE COMMISSIONERS.**—We are pleased to learn of the reappointment of Messrs. H. O. Stanley and E. M. Stillwell as Commissioners of Fisheries and Game for the State of Maine. The latter gentleman, although not appearing as such, has in reality held the position and discharged the duties of commissioner during the past year, having served at the request of the Governor's Council. His reinstatement will receive the cordial approval of citizens of Maine.

**SEAL HUNTING.**—The hardy sport of seal hunting has not found favor with many of our sportsmen, yet no doubt it may be an enjoyable one. We learn that the well-known naturalist, Dr. C. Hart Merriam, whose contributions have often enriched our columns, will start next week for Newfoundland and the Northern ice fields on a big seal hunt. We hope he will have all the success that he has hoped for, and that he will give us some account of the trip.

**MAINE BIRDS.**—Many of our ornithological readers will no doubt be surprised, as we confess we were, at Mr. Smith's arrangement of the families of the *Grallatores* in the list of Maine Birds, now being published in these columns. This arrangement was not determined upon by the author without consideration, and we leave it without change and without comment.

**THE CHESAPEAKE BIG-GUNS.**—Just as we go to press we are in receipt of a telegram from Baltimore dated February 20, which reports that three more big-guns have been captured, making seven in all, and the remainder are located.

**OUR READERS** will confer a favor by sending us the names of such of their friends as are not now among the subscribers of the *FOREST AND STREAM*, but who would presumably be interested in the paper.

## The Sportsman Tourist.

## NIMROD IN THE NORTH.

BY LIEUT. FRED'K SCHWATKA, U. S. ARMY.

## IV.—Nimrod with a Shotgun.—Part One.

WHILE in the winter time the Arctic regions are an almost barren country for the sportsman after small game, there is no place on this planet where it is more plentiful during the short summer, especially of the aquatic variety, and the lover of duck-shooting could certainly gain his fill in a short while.

While encamped in North Hudson's Bay it was considered no great delights at all to take the shotgun out to one of the many lakes in this vicinity and get a good mess for our little party. These lakes, which were nothing more than vast impervious basins of granite full of drainage water, were so numerous and oftentimes so large that I do not believe I exaggerate when I say that their superficial measurement would be one-third of the whole country thereabouts; certainly they were a most annoying impediment to inland traveling in the summer, and an equally fortunate boon in the winter when we followed over their level surfaces with dog-teams and sledges. Each pond or lake contained its little family or families of eider ducks, and if it were at all large, and especially if it were dotted with flat, grassy islands, which gave them protection while breeding, they would be in large bands over its surface. They only inhabit the ponds and lakes near the sea shore until the young are large enough to fly, when they congregate in the flocks, inlets and bays of the coast, in oftentimes numbers. It was not without some trouble we had to penetrate their ironclad coating of feathers, the greater majority of those secured being shot in the head and neck. As small shot was equally efficacious in this method of destruction, we adopted it, with the effect of increasing our scores.

Our first efforts were often laughable. Colonel Gilder one day turned a duck's feet into the air, and the result of this showy yards was that the wind had blown him nearly into shore, all the time kicking vigorously, the Colonel, desirous of facilitating his travels, commenced throwing large stones just beyond him with the effect of bringing him right side up with care. The duck looked around astonished, sneezed a couple of times, and when the next stone splashed alongside he disappeared in the water and came up over a hundred yards away, where he coolly proceeded to arrange his feathers after their last disturbance. Could any of the many dealers or manufacturers in shot-guns who advertise so extensively in *FOREST AND STREAM* get a good record on the Arctic duck, I think he could rest perfectly satisfied with his practical test.

The compass is a sluggish, unreliable instrument in the northern part of the bay, and is of little use in establishing a good long north and south line while conducting surveys, and for reasons unnecessary to explain, I fixed upon the expedient of doing so by the culmination of Jupiter. My north point was fixed near camp, and the south one approximately about a mile away across a lake; and one night I sent Henry to it to fix it as accurately as possible by this method. I gave him a small torch to define his position, and the man expected to find the star and the signal in the instant of culmination which I knew. My shotgun case contained a duck call, and I fixed on it as a good instrument to be heard a long distance, and told Henry that one *quack* meant the right, while two meant the left. The night came and Henry took his place, and I could see that he would be out of the way even a quarter of an hour ahead; and I gave a *quack* that sent him nearly as far out of the way on the other side. *Quack, quack*, was sent to him, and he had just gone about half way back and nearly where I wanted him, when there came floating over the lake *quack, quack*. That dragged him way out again. A single signal from my call to rectify this was answered by about a half a dozen single and double calls all over the lake; and I soon found that I had stirred up about a hundred ducks, all of them fully armed to present the winds scattering it away, and as gathered wings in this particular job. At once gave up the quack method and returned to the standard rules of the regular school, but I wasted a bag of shot on that lake next day, and we lived for a week on Jupiter birds, as Henry called them.

One writer says that the mother will lead the young ones to the water almost as soon as they creep from the eggs. Going here, then, for the first trip after the hatch, when she comes to the water-side, she takes them on her back and swims a few yards with them, when she dives, and the little ones are left floating on the surface, and are obliged to take care of themselves. After once initiated to the water I think they never return to the land. From these birds is produced the soft down so well known, and which the female plucks from her breast to line her nest. In the sub-Arctic regions the people regularly rob them of this, and it forms an important item of commerce. It robbed, the female forms another nest in the same way, and the third time she is compelled to call on the master of the household for a supply of down from his breast. Each female yields, it is said, about four ounces of this material, and so soft and light is it that it has to be mixed with moss roots and gravel by the old bird to prevent the winds scattering it away, and as gathered wings two or three times its final weight. Upon King William's Land my party in one day saw about forty of these nests, the whole island being comparatively abundant with them, and I have but little doubt that one person alone could have seen as many had that been his sole object. Should aerial navigation ever be completed, such wages as \$25 to \$30 per day (or even half that if the market should become slack) would undoubtedly draw many thither during the breeding season of nearly a month in length.

I have said that the eider favors the little islands in the large lakes or those along the seashore for protection while breeding, the Arctic fox being the most inveterate egg-sucker I have ever met, and consequently their worst enemy. One method they have of circumventing this pest in Spitzbergen is too curious to pass by. If driven off their nests they hide away the down of the nest over the eggs, and glue it with a copious supply of yellow fluid, which not only retains the warmth of the eggs for a long time, but is of so extremely offensive a nature, that the foxes would not touch the eggs tainted with it.

The eider-ducks of Hudson's Bay are mostly the common variety; all of those of King William's Land being the crested or king eider. Yet an indifferent observer would believe that there were more varieties of eider ducks than different is the plumage of the sexes, and the fact that when

in large bands, they are nearly always separate. The male is clothed with a fleshy topknot, a more vivid yellow, and his whole "set-up" is the most conspicuous contrast of complementary colors, all of the liveliest hues; while the female is a mass of rusty brownish-black almost the exact color of the half-dead moss in which she makes her nest, and where she will never be seen until with a whirl like a ruffed grouse, she springs up right under your feet apparently. Sitting in a line on the edge of a large ice cake, the males look like a regiment of hussars or a squadron of dashing dragoons in full uniform, while the females look like a procession of Carthusian monks in their sombre garb.

We almost lived on their eggs for a short time while on King William's Land, and the suddenness with which they became added was wonderful. One day nine eggs were obtained, all of them good, as had been all previous ones, and the next day (which dates I have always regretted not recording) twelve out of thirteen were added so they had to be thrown away; and after that not one good one was found, although we kept testing them for three or four days, until we were convinced that further efforts would only result in an unwarranted destruction of small ducks. The manner in which the young ones appeared about three weeks later was almost on a par, and it seemed as if we had suddenly been visited by a shower of young ducks. In some parts of the Arctic slippers made from the breast of the eider are used instead of the inside reindeer stockings, but do not wear so long, and are ruined by damp.

One day, in the early part of September, I walked along the eastern shore of Tenor Bay, and here I saw the eiders marshalling for their southern crusade. This shore is seven or eight miles long, and from its very southern cape until I reached its head I was passing by straggling bands reaching half a mile to a mile from shore, the outlying members of each little party being so efficiently mixed to say the least, that I approached them as if they were a single flock. These nearest the shore I approached until I could see the heads of hundreds of them, and this kept a black ring of about that radius constantly on my left as I walked along.

But of all the Arctic ducks that will force themselves upon your notice, there is none like the noisy *tank-sok* of the Esquimaux, evidently the "old wife," "old squaw" of the winter in the temperate zones (*Harelda glacialis*). I have never seen them in large flocks in the North, but they make up in noise and activity what they lack in numbers. This gurgulous bird, however, or rather a pair of them, calls in the temperate zones, seems to multiply them as it visits the North to breed, and whenever we asked any question of our Esquimaux comrades regarding the numerous, weird, unearthly and variegated sounds that we constantly heard, the stereotyped answer was *tank-sok! tank-sok!* until we accredited everything to this mocking-bird of the North, the "ventiloquist," as Colonel Gilder called him, for he seemed to find this accomplishment with his many others. He loves the North, and sticks to its dismal regions long after others of his species have left, or as long as he can find the least bit of open water. As long as a few are in a lake near by, the Arctic does not seem in the least deserted. I have no desire to speak further of the many kinds of ducks familiar to both zones and with which the sportsman comes in contact every shooting season at his own home.

[TO BE CONTINUED.]

## A MISADVENTURE IN SOUTH AFRICA.

BY EDWARD MANNING.

A QUARTER of a century ago I found myself in Cape Town, South Africa, I was then a sailor, and not liking the abusive and cruel manner in which the commander treated his crew, I declined to continue longer in his ship. While waiting for a vessel that needed an officer I became acquainted with two Englishmen, by name Mr. Whitley and Mr. Baker. They had come to Africa solely for the purpose of making a large game which at that period was to be found in abundance some forty or fifty miles to the north and east of Cape Town. This was the country of the Bushmen, and as they were not of a particularly brave or warlike character, a party of hunters could generally get along without meeting with any serious obstructions from them. The danger of treachery from the Bushmen added zest to the sport, and if a thieving negro was shot now and then instead of a rhinoceros or a hyena, why then there was no need of Africa.

When I first made the acquaintance of Whitley and Baker they were preparing to start for a week's shoot, and they kindly invited me to join them. They also generously offered to supply me with a large calibre rifle, ammunition, knife, and everything else which I should require for such a journey. This liberality I did not attribute to an excessive fondness for my company. On the contrary I had the feeling that the mother of all men added strength to the Anglo-Saxon element, which was a very important item when it is considered that our attendants were all black men, who had been picked up while looting about Cape Town. The savage instincts of the race had not been so thoroughly eliminated by their frequent contact with the white men as to make them altogether honest and trustworthy, and it was necessary that this fact should be borne in mind. The food supplies consisted largely of hard bread and pemmican, we were not strong enough to supply the party with fresh meat. I should not neglect to say that my English friends were careful to see that the fluid part of the provisions was not overlooked, and as this consisted of a generous quantity of old English ale in bottles, I thought their forethought very commendable.

The provisions, a shelter tent, three rifles, two shotguns, and the ammunition embraced about all we cared to be encumbered with. Our attendants consisted of six negroes and four dogs. To the negroes we assigned the duty of hunting on supplies. This was very well so far as the hunting and shelter tent were concerned, but we found before long that a great mistake had been made in committing to their care the food and liquid supplies.

The arrangements being completed, we started off one fine morning, and after trudging through a mountainous country for five hours, we selected a cool and shady spot, where we prepared to partake of some refreshment and to rest for an hour. While munching our hard bread we were suddenly made aware of the presence of one of those slimy, poisonous serpents which inhabit this part of the earth, by observing the excited manner and wild gesticulations of one of the negroes. Looking up I saw the basilisk eyes of a snake glaring at me, and as it was not more than fifteen feet away, and ready to spring, I was in a position of great danger. Baker, who was a few rods to my left, seized his gun and shot the snake dead. Fortunately for me he had carried

his gun, expecting to shoot some birds before we uncovered the large game. The probability of this cool and shady place being the favorite resort of poisonous snakes was not pleasant to contemplate, and the proposal to move without further delay met the hearty approval of the party.

We pursued our journey until nearly seven o'clock that night. The creeping vines and rank vegetation made the walking difficult and fatiguing, and had Whitley or Baker suggested the advisability of camping long before this hour, I should have been glad to comply. They, however, were anxious to reach the borders of a small river or creek, where they expected to find the hippopotami and rhinoceros in the jungle which extended along its margin.

The lazy negroes were now becoming restive, and I believe they would have refused to continue longer with us had not Whitley threatened to shoot them if they dropped our stores. This was not a Christian-like way of persuading men to do one's bidding, but it must be remembered that our attendants were not civilized, and only thing a savage can understand is force. This was the opinion of Whitley and Baker, and as their experience in such matters was much greater than mine, I suppose they must have been the most competent judges.

When at last the order was given to spread the tent, we had gotten within eight or nine hundred yards of the river. We were on the verge of the forest, and the jungle was within one hundred yards of the spot. Supper was prepared, and the furious barking and squeaking of the dogs kept us in a state of nervous excitement. We had expected to shoot an antelope during the day, but none had been seen. An antelope steak would have materially improved our larder and been appreciated by the party.

After the negroes had eaten their supper we set them to work gathering fuel for the fires we intended to build around the camp, and when night set in the forest was applied and the howling hyenas and other wild animals during the darkness. As we could not trust the negroes to keep the fires burning without being watched, we divided the night into watches, and Whitley agreed to stand the first, Baker the second, and I the last watch.

Wrapping a blanket around my body I lay on the ground inside the tent and was soon asleep. I had been asleep four or five hours when I was aroused by a series of prolonged howls and the furious barking and squeaking of the dogs. I jumped up, and, seizing my rifle, rushed out of the tent. The fires were burning low, and some were quite out. Whitley and Baker were standing close together holding their rifles cocked, and when I saw them in this fighting attitude I cocked my rifle and joined them. The cause for the alarm was soon explained. The negroes had stolen our stores, and they had gorged themselves with the food and drunk so much ale that they were ready to burst. They were crazy drunk, and while their stomachs were so distended they could not stand, they could still use their tongues, and this they did so well that the forest fairly resounded with their cries. Four or five hyenas were prowling around the camp, and when the dogs attacked them two of the dogs were killed and one was badly wounded. The injured dog was moaning pitifully, while the whurl one was yelping with all his might. We could hear the crunching of bones just behind him, and the first thing that was learned later that one of the negroes more drunk than the others had fallen in a stupor outside the fires, the horrible thought became a certainty, and we knew the hyenas were holding their ghastly feast over his body.

"Hist!" said Baker. "Don't you see those glittering eyes yonder under those bushes? pointing with his hand toward a clump of bushes not over thirty yards away."

Whitley and I, in the direction pointed out, and we saw the gleaming eyes of some animal.

"That's no hyena," said Whitley. "Stand close together, and take the best aim you can, and when I give the word let's fire together. For God's sake be quick or he'll charge us!"

In the presence of such imminent danger our nerves became as firm as steel, and in less time than it takes me to tell you we had drawn together, took aim, and at the word "now," we fired at the glittering orb. The deadly report died away when a fierce growl, followed by the fall of a body within twenty feet of where we were standing, made us spring aside. The animal gave several fierce growls and struck out mightily with its paws, scattering one of our fires to the four winds of heaven, and then it rolled over and remained quiet. We loaded our rifles, and cautiously advancing we fired three shots into the animal's head. As the bullets crashed through its brain no tremor of the body could be seen, and we were now convinced that it was dead.

On examination it proved to be a large male lion, and after this was known we mentally thanked God for our deliverance. Of all the beasts of the forest we dreaded to encounter, the lion was the one which we feared the most, and it was understood among us when we left Cape Town that should one cross our path it should not be fired unless it was imperative to do so to save our own lives.

"Fix the fires at once," cried Whitley when he saw the carcass of the lion. A large quantity of brush had been piled up in the camp before night set in, and from this the fires were fed, and soon they were burning brightly.

The probability that more lions might be prowling around the camp effectually destroyed our inclination to sleep any more that night, and we agreed to remain on guard until daylight.

The sharp report from the rifles, followed by the growls of the lion, seemed to arouse the drunken negroes to a sense of their danger, and they staggered to the center of the camp and huddled close together, perfectly submissive now, and as docile as kittens. Whitley expressed the greatest contempt for them, and had it not been for Baker, I verily believe he would have driven them beyond the fires to take their chances with the hyenas and lions. Some time later Whitley explained that he fell asleep during the last watch of his watch, and the negroes had taken advantage of this to steal our supplies and get drunk. He knew it was a bad thing to do, but he was so overcome by the bodily exertions of the day that he could not help it.

The four that lions and other savage beasts were prowling around, only waiting for a favorable opportunity to make a dash at us, kept our nerves strung up to the highest tension, and when at last daylight appeared we felt as if a mighty load had been lifted from our minds. The negroes had nearly demolished our stores, for what they could not eat they had scattered over the ground in the most wasteful manner. We gathered enough bread and cheese to last for a day or two. Baker found some coffee, but for awhile we thought we should have to go without it,

as the coffee-pot could not be found. Knowing that the negroes could not cut it, we made a close search and finally found it under some bushes twenty feet beyond the camp. It smelled powerfully of stale ale, and this was convincing proof that the negroes had used it to drink out of, and when they were well "set up" they had tossed it away. The bold manner in which they had acted convinced us that we had picked up about as bad a lot of black thieves as could be found in Cape Town, and it was decided to drive them out of the camp as soon as they could stand. It was now impossible to continue out a week, and it was agreed that we should hunt that day and return to Cape Town the following day. The wounded dog was beyond the hope of recovery, and we shot him to put him out of agony.

Whitley took the coffee-pot and started toward the river to get some water, and after an absence of ten or fifteen minutes he returned with it filled. He said he had seen a full-grown hippopotamus just emerging from the water not more than one hundred yards from where he was standing, and not wishing to alarm it he had filled his coffee-pot and made his way back very quietly.

Whitley was a true hunter, and I could see how intensely pleased he was at the chance of getting a shot at the hippopotamus. Our bad luck and misfortune of the night had temporarily flown from his mind, and while waiting for the coffee to boil his impatience to be off to the river was manifested by several vigorous expressions, and the coffee-pot was regarded as the devil more than once. At last the coffee was ready, and after making a hasty breakfast we gathered up the few remaining supplies and the tent, and hid them under some bushes, piling a lot of brush on top to make them as safe as possible. As we apprehended no immediate use for the two shotguns, they were hidden in another place, and more carefully, as we did not care to have the negroes find them after we left the camp.

We now took the ramrods from our rifles (this was before the era of breech-loaders), and applied this to the processes of the negroes, and so vigorously and heartily was this done that it proved the very best medicine we could administer to the half-drunken brutes. They were soon dancing about, and after Whitley had explained to them that their company could be immediately dispensed with, they realized that their fun was over, and slowly slunk away in the forest. The only dog left belonged to the negroes, and he followed them despite of what we could do to coax him to remain with us. This I regretted, for we could have used him to advantage in the jungle.

After reaching the banks of the river we made an effort to walk along its margin, but the soft mud was so yielding we had to abandon the attempt. We now forced our way into the jungle, and after an hour's laborious work we struck a trail leading from the river in the direction of the forest. It was apparent that it had been caused by the feet of many large animals, and Whitley thought it was their path to the water. As we approached the river we saw a large hippopotamus coming out of the water. His body was well out of the water, and offered a good mark for our rifles. We had come upon him so suddenly that he was not aware of our presence, and before he had time to discover us, Whitley and Baker gave him a shot from their rifles. He belloved and tried to back into deep water, but it was evident that he had been hit hard, for he soon after rolled over on his side, and a few minutes remained there. As he was not very deep where he fell, we had a good view of his body, and we found him to be a large specimen of his kind. If our negroes had been with us they could have had a royal feast off his carcass, for it was certainly large enough to supply even their wants, gluttons that they were.

While viewing the dead hippopotamus we were startled by hearing several loud and savage yells, which were followed by the barking of the dog.

"What's up?" cried Baker. "It sounds like the yells of a party of black devils. Let's investigate," and moving toward the border of the jungle which faced the forest, we saw a large party of Bushmen, who were shouting and pointing with their assegais toward the place where we were standing.

"Our thievish niggers have joined them," said Whitley, and they quickly attacked. "So let us make a dash for the forest and fight them from behind the jungle trees."

"We can't do it," replied Baker. "They will overtake us before we reach it. We had better lie low here and give them a few shots before we make the effort."

The Bushmen ran huddled together, and advanced toward the jungle, and as they came on we heard the yelping of a dog some distance ahead of them. The cur seemed to have scented our whereabouts, and as the Bushmen followed this trail it was evident that in a few minutes they would be upon us.

In silence we awaited the onward rush of the savage negroes until they had gotten within one hundred yards of us, and then, picking out three of the leaders, we raised our rifles and fired. Every shot took effect, and the three negroes dropped to the earth. This brought the party to a sudden halt, and we improved the time by loading our rifles. The respite, however, was of short duration, and they were about to rush upon us with the jungle trees used as cover, and a fierce rhinoceros charged right into their midst, impaling one of the negroes on his horn and knocking down and trampling on all whom he encountered in his fearful charge. The monster's charge was so sudden and unexpected that it demoralized the negroes, and they scattered and ran in all directions.

The appearance on the scene of such an ally astonished us, and for a few seconds we were quite dazzled by the event. But we soon recovered our senses, and embracing the chance offered by the panic among the negroes, we ran for the forest, and in a very short time we reached its sheltering fold and were hidden from the view of our enemies. We continued on a "dog trot" through the forest until quite exhausted. As the shouts from our foes had long since died away, we moderated our pace and proceeded more leisurely. Whitley had a small pocket compass, and we looked to him to extricate us from the wilderness and guide us to Cape Town.

As night approached and the shadows were cast over the forest, I imagined that I saw spectral forms sliding before me. Hungry, with no chance of getting anything to eat; weary and footsore, with no safe place to rest, we felt truly miserable. How should we pass the night? In a tree, was the only solution to the query, and we looked around to find a tree. Whitley was now convinced that the forest was large enough to protect us from the attacks of the cur, and

Deliverance from this woful predicament was near at hand, for while we were in the act of ascending a tree which Baker had hit upon for a "roosting place," the barking of dogs was heard some distance on our right, and soon

after we heard the crackling of twigs and a creaking sound which we could attribute to but one cause—namely, an exact much in need of a lubricant. The party (for such it proved to be) soon after came to a halt, and through the oppressive stillness of the forest we heard orders given in a language that sounded as sweet to us then as the most heavenly music, and soon the cheerful blaze of a fire illuminated the forest.

We now cautiously approached the camp of the strangers, and when the dogs began barking Whitley cried out in a loud voice, "We are Englishmen in distress."

The dogs were beaten back and we heard a voice calling us "to come into camp." This we were not slow in doing, and we found the strangers to be a strong party of hunters returning to Cape Town after a month's shooting. They were thoroughly equipped with arms and supplies, and had a pair of oxen to haul the cart containing the party. The party consisted of four Englishmen and ten trusted Caffre servants, and when I asked one of the Englishmen if he did not fear an attack from the Bushmen who treated us so treacherously he laughed, and said "he thought they wouldn't bother us. If they did a volley from the rifles of his Caffres would scatter them."

We ate a hearty supper, after which our friends supplied us with a blanket apiece, and as we were completely exhausted we were excused from making a very lengthy recital of our adventures that night.

Nothing occurred during the night to disturb our rest, and very early in the morning we ate our breakfast, after which the party resumed the march to Cape Town, where we arrived, without further misfortunes, late the same night.

The last time I saw Whitley and Baker they were getting ready a strong party of friendly Caffres "to have that shoot out anyhow." They swore they should get even with the Bushmen, and when this remark was made I saw by the wicked look in their eyes they meant business.

## TWO AFTERNOONS.

SAM and I had been hunting quail all day, and late in the afternoon, as we were working over toward Ellis Hollow, I suggested that we take a run through the alders down in the Hollow and get a few grouse before dark. "Sam," said I, "do you remember how even our bags have always been when we have hunted over here? We have usually had about the same number of birds, and I have always been the best shot; but this time I'm going to beat you." The only response was a simple grunt, which spoke volumes to me, as more skepticism was crowded into that one contraction of the vocal chords than could have been expressed by any combination of words.

Ellis Hollow is a gummy little valley, through which a small stream runs. A strip of alders a few rods wide shades the west of being ground for woodcock, and on either side are knolls of beech and oak woods in which ruffed grouse are always to be flushed, the birds usually being found along the stream late in the afternoon. Here and there open places grown full of cat-tail rushes, and along the tumble-down, lichen-covered fences the dogs sometimes get into a chronic condition of pointing, with few interruptions, for an hour or so at a time.

Belle and Grouse moved their noses up to their widest gage as we approached the alders, for they had been there before and knew what was to be expected. A little more cautious step, a little more pausing with heads high in air, and a more careful eye to each other's movements marked their actions. Just as we passed through a clump of hemlocks old Belle's legs commenced to grow stiff, and the youngest Grouse sprang in the same condition. At that instant, with a sudden rush, a grouse dashed from under a log and flew straight for Sam's head, and the latter, turning quickly around, coolly wound his gun up in a festoon of grapevines, vainly trying to pull over that part of the woods to which the grapevines were attached, as the bird made his way across an open place in plain sight. Another grouse sprang out of a hemlock and disappeared quickly, leaving only a little wisp of smoke to mark the place, and an old cock bird ran clucking out of a patch of briars close to me, with crest raised and tail spread widely, and started a circle of rustling leaves in his wake as he, mounted on wing, the Parker was on him in an instant, and he turned over and over in the air, leaving a stream of feathers floating back on the breeze as he bounded in among the wintergreens.

"Tell you what it is, Sam," said I, "this wood powder is a fine thing. You can see your bird will so prettily right before your eyes, and can fairly see the shot hit him." "Yes," said Sam, "that's a fact; but my bird didn't happen to wilt, and, besides, I ran a stick so far into my eye that it poked my hat off from the back of my head." "That's a poor excuse, old boy," I answered, "and you want to get another excuse ready for the next bird, and hurry up with it, too." Old Belle looked the lifeless bird proudly, with her short tail wagging and ears up, while Grouse stood trying to poke a feather off from the end of his nose with his paw, and then we started into the alders in earnest, but worked clear across them without finding anything except a rabbit or two. Both dogs again made game at the edge of a beech knoll, and the bird flushed wild, Sam failed to stop him, and as he came hurrying past me at forty yards distance, I held my rifle and pulled the trigger right in the air, but the grouse still kept on flying like an arrow, and went way up in the swamp. We started after him, but he had not alighted at the place where we marked him down, and the dogs finally had to give it up. It gives one a very disagreeable feeling to wound a bird and then not be able to find the poor thing and put it out of its misery; but this bird did not seem to be put out of his, and we left it to his choice. Working along through the alders again, we found a lot of borings where the woodcock had stopped over night, but the bird could not be found, and the dogs started off on a new trail, with a grouse sort of behavior, trailing toward an old fence where we usually started a grouse. Sam kept near the dogs, while I went to one side, hoping to get a more open shot.

Suddenly Sam called out, and both dogs were steady on a point, and at the sound of his voice a bird arose, alighted, and immediately following the report of his gun. Just then another grouse sprang out from almost under my feet, and by the time that he was far enough away to shoot at, the alders nearly hid him from sight. A quick double snap shot failed to stop him, and he went a long way up on the side hill and over the fence into the woods. "I suppose that you are wondering where I have killed that bird," said Sam, "but if you'll look ahead there you will see that it is not about six rods of solid alders, and the patch will be

cleared up well enough to plant potatoes on in the spring." "That's all right, Sam," said I, "but I usually use the right barrel to clear up the brush with, and the left one for killing the bird after I have got him slunked, and that bird was certainly hard hit." Sam was very skeptical, but I started up to cross the lot to the place where the grouse had entered the woods and there found him lying on his back as dead as a stone, and nicely laid out on a wide bed of green moss. I picked the handsome fellow up, smoothed his feathers, and held his wings, and his head, and then slid him down head first into my big inside Sam's pocket, where he fell with a thump against the one already there and the quails. How nice it feels to shake the edge of your coat a little and settle a heavy bird down in the corner where he will fit. And how your dog's eyes do sparkle as he watches the bird sliding out of sight and knows that it is safe.

Turning back toward the alders again I heard a quick double snap below me, and fell following "w-h-o-o-p" from Sam, and two grouse hurrying off over the tops of the trees told the story.

Both dogs commenced working together again along an old cart path, and slowly and cautiously followed up the bird for several rods, finally coming to a point in a narrow strip of alders. Old Belle was crouching low, with nose raised and head down, and Sam was standing with his back to the side of her with his head a little to one side, and in the anticipations that he had forgotten all style, and in the one hand leg raised in a most awkward attitude, but his other meant business nevertheless. Sam stepped over on one side of the alders and I stayed on the side with the dogs and very near to them. For a moment we watched them admiringly and then, with a sudden rush, out went the bird, dashed up his legs, jumped and raising his crest he whirled with spread tail and nose toward me, and flew out across the open. How pretty the black bars on his sides and the spots on his back did look as I fixed my eyes upon him and waited until he was four or five rods away. The gun came to my shoulder, fitting as neatly as a glove, and I coolly pulled the trigger. The lusty bird halted in his swift course, and dropping his head and raising his wings, he came down, and with a nod and the gay leaves from his little swan's napkin and with his branches swish as he tumbled crookedly through, and then lay beating a tattoo on the ground with his wings, leaving a few prettily marked feathers hanging in the branches of the maple, while two or three others floated down with the gyrating leaves. Belle fetched the bird eagerly and after smoothing out his feathers and feeling of his plump breast I slipped him into the pocket on the other side of the coat for ballast.

By this time we were almost at the upper end of the alders, and the dogs were making game near the edge of the brook. There in a patch of soft ground on the bank were several groups of small round holes bored into the rich mud, with here and there a patch of white about the size of a half dollar, and we expected every instant to hear the familiar twitter of the long-billed, brown-breasted, soft-feathered bird, that had left his mark, but we could not have the pleasure of seeing him top the alders and fall lifeless back, for he had evidently only tarried there awhile the evening before on his journey South.

It was fast growing dark, and we started for the road, stopping at a farmhouse long enough to get a couple of glasses of sweet cider, light our pipes, preparatory to our long walk home in the clear November evening.

The next day was devoted entirely to grouse in a favorite hunting ground of ours, and we killed as usual enough to make us thank our fortunes that we were hunters. I remember one remark which Sam made on that day. We had flushed a magnificent cock bird twice without getting him, and finally cornered him under a fallen tree-top. Sam mounted the tree-top, and as the grouse dashed out with a startling whirr-r-r, sent him head over heels into the yellow brakes; and when the bird was fetched, Sam held the splendid bird out at arm's length, and gazed at him fondly for a moment; then, taking a deep breath, exultingly said: "Look at that bird! Just look at him! Who cares for titles! Who cares for millions! They are all vanities! Shallow! When a bird like that grows up in our woods! How many times since I remember I have browsed under the branches of the Indian summer light under the overhanging branches of the great forest trees in an inspired attitude, repeating that sentiment."

Shall I ask pardon for this digression? Well, we will go on to the following afternoon. Sam and I had again been hunting quail, and had gradually worked over into the thicket of the alders again, and was getting quite late in the day, and Sam suggested that we just turn around and take a run through the alders, and give him a chance to get even with me on the previous score made there. I willingly consented, and we started in enthusiastically, but hunted over one favorite bit of ground after another without raising anything except a couple of rabbits, which Grouse watched wildly with one eye, as he kept the other on my whip pocket. When we had almost finished the strip of alders, and were wondering what had become of the birds, we suddenly noticed that the dogs were quiet, and just then a grouse jumped out and was handsomely tumbled over by Sam. The dogs instantly began following another trail, and followed it clear to the last bunch of alders, and as I turned to look for Sam a grouse flushed close to me and made off in safety, my charge of shot being stowed away in the trunk of the tree about four feet away. That was proving certainly, for it did not seem possible that that grouse could get away in such an open place, but the fact remained that he had gone, and we marked him down closely. Although the day was fast closing, we decided to go back after the bird, and before we had gotten half way to him I walked "right on top" of a pair of grouse that had probably just come down to the alders. As they climbed away from me, I saw a forked branch in my way, but a forked branch held my gun barrel about a foot under the first one, and something else from the bird's lucky star prevented me from getting bearings on bird No. 2, so that they escaped in the style.

My chagrin was rendered more poignant at seeing a grouse arise at a long distance from Sam and fall circling away. Are you wondering why Grouse and Belle glanced reproachfully at me as the bird was brought down? I simply decided to kill the grouse which we had marked down anyway, and as both dogs pointed staunchly at his hiding place it seemed that the bird must come my way. He didn't do anything of the sort, however, but acted just as grouse have acted before, by getting behind the fence, and keeping behind it until out of range. Another bird jumped up a short distance from Sam, and the latter started the feathers but did not kill the bird, which

followed the first one, and we watched both as they climbed up the side hill, and on bent wings went sailing into the woods. In a moment we were upon them again, and the dogs had hardly commenced barking before they pointed. Sam flushed one, and as it came down past me at full speed it fell dead before my very nose just as my trigger was on the point of being pulled. The other bird then started from behind Sam, and as it made straight for the tops of the trees, Sam pulled and reversed the bird's lever so that it came quickly backing down again. The grouse on striking commenced fluttering and bounding at a great rate and went tumbling down the side hill. This was too much for the nerves of young Grouse, and in spite of his knowledge of the rules of propriety, he rushed in and made a grab for the bird, stumbling as he did so, and rolling over and over alongside of the fluttering bird, his feet in the air and his neck stretched to its fullest extent, reaching for the grouse amid a shower of dry leaves which were being kicked into the air. The spectacle was so amusing that it was hard to punish the eager youngster afterward, but it was necessary to punish him just a little to remind him that there were certain limits to his usefulness.

Sam now had four grouse and I had none, and it was already dusk. We had hardly re-entered the alders, however, before both dogs came to a point near an old fence, where the brush was so thick that I could barely see them. After a short time in this position, and, catching a faint glimpse of him, I fired a snap shot which I was sure was enough to show that the grouse was down, but I rather doubted the fact until the thumping of his wings on the ground pushed the fact into my willing sensorium. Sam could see the whole performance from where he stood and swore that my shot did not kill the grouse. He explained by saying that he believed the bird to have been so mortified at being in the presence of a man who possessed such enough to try a snap shot like that, that he flew against the top rail of the fence and deliberately committed suicide. Sam accounted for the shot marks by saying that it was a bird which he had fired half a dozen charges into during the autumn. "Now, see here, Sam," said I, "you know perfectly well that that was a better shot than you ever got out of your birds this afternoon gave you such easy shots that in the presence of them myself I was sure I had been standing in your shoes. I'd rather have this bird in my pocket than a dozen of yours, but anyway we will hunt for grouse all day to-morrow and try and get our records smooth again. I'll acknowledge that you are even with me on the score we made here day before yesterday, but don't think that it was quite fair in you to try and get away."

That evening, after we had reached home and had disposed of an enormous quantity of snap-jacks, stewed grouse, milk and pumpkin pie, Sam set a big pitcher of cold cider on the table and we tipped our chairs back on two legs against the wall, lighted our pipes and told yarns till bedtime with two or three of the boys who had dropped in as usual after supper.

MARK WEST.

## AROUND THE COAST OF FLORIDA.

BY DR. J. A. HENSHALL.

### Fifth Paper.

WE left Miami at eleven o'clock in the forenoon with a party of eight, mostly with Mr. E. O. Sawyer, Mayor of Key West, having concluded his business at Miami, and a mail schooner not leaving for several days, in fact had not yet arrived from Key West, we offered him a passage, as we intended going direct to that city. We greatly enjoyed his genial society on the trip, for being well informed, and a close observer, he possessed an abundant stock of information about that section of the country.

As we sailed out of Miami River, the line of keys shutting in the bay from the ocean were, plainly visible toward the southeast, the most northerly being Virginia Key, then Key Biscayne, Soldier Key and Ragged Keys. The south point of Key Biscayne is Cape Florida, upon which stands the lighthouse tower, now abandoned as a light station. Eastward of Soldier Key, and five and a half miles S. E. from Cape Florida, is Fowey Rocks Lighthouse, on the northern extremity of the Florida reefs. It is an iron framework, with the lantern one hundred and ten feet above the sea, showing a fixed white light, visible in clear weather some sixteen miles. This light is situated at the northern entrance to Hawk Channel, leading between the line of Florida Keys and the outlying reefs, along the Florida Straits to Key West. The channel is from three to five miles wide and is from one hundred and forty miles from Virginia Key to Key West.

Biscayne Bay is broadest abreast of Ragged Keys, and about here begin the Feather-bed Shoals, a series of parallel sand shoals stretching across the bay. They are easily discernable, showing quite white at a distance, and by following the shoal in either direction an opening will soon be found. Below Ragged Keys is a long one called Elliott's Cay, near its southern extremity a group of small keys, strait across Biscayne Bay, separating it from Card's Sound. Small boats may proceed through Card's and Barn's sounds, and then keep under the lee of the line of keys to Key West; but it requires some previous knowledge or the employment of a competent pilot, to avoid the many mud flats, shoals and reefs of this route, for the water is shallow. One of the most delightful and interesting excursions that I hope some day to make. Owing to the many keys, mangrove islands and shoals, with the mainland to the north and the Florida Keys to the southward, the water is always comparatively smooth. There is an abundance of shore and wading birds, an endless variety of fishes, oysters, turtles, etc., while on the Indian hunting grounds on the mainland there is plenty of large game. A good, well equipped canoe, with a crew of a few men, and a few natives, can be chartered in a small canoe, capable of being sailed and paddled, and it is surprising to me that some of our enthusiastic and venturesome canoeists do not attempt it.

Sailing down Biscayne Bay we took a number of tarpon, groupers, crevalle and barracudas on the trolling lines, and saw numerous loggerhead and green turtles. At the south end of Barn's Key, a large key to the south of Elliott's Creek, winding between this key and some smaller ones, we followed Caesar's Creek to the main channel inside the Florida reefs, before mentioned, where we anchored at sundown, some thirty-five miles from Miami. The next morning broke clear and fine with a fresh E. N. E. breeze, and leaving the mouth of Caesar's Creek we went dashing along, leaving Old Rhodes Key to the starboard. We next came to the mouth of the Indian Hunting grounds, and there we caught the last glimpse of the mainland that we would

have until we sighted Cape Sable, after leaving Key West. Jack, catching the inspiration of the theme, mounted the cabin roof, waved his hand toward the distant peninsula, seen through the fast-closing gap between the keys, and dramatically declaimed:

"Adieu, adieu! my native shore  
Fades o'er the waters blue."

"Ta, ta! Jack," said Squire, "I'll see you later; 's'mother evening."

But Jack was not to be smothered in any such manner, and continued:

"O'er the waters of the dark blue sea,  
Our thoughts as boundless and our souls as free,  
Far as the breeze can bear, the billows foam,  
Survey our empire, and behold our home."

"If you want any surveying done, call on Mr. Gwynn, here; he is county surveyor of Monroe county, as well as Mayor of Key West, and has jurisdiction all along these keys."

The wind continued to freshen, bringing in a long-rolling sea between the outlying reefs, which caused Jack to seek the cabin and his bunk; so we had no more poetry that day.

We were now opposite Caystort Reef Lighthouse, which is twenty-three miles S. by W. from Fowey Rocks Light. It shows a bright flash every half minute, visible some seventy miles. Key Largo, is some twenty miles long, has a number of settlements, and some large pineapple plantations, the largest being those of Mr. J. Baker. These keys are, most of them, thickly wooded with a variety of hard timber, buttonwood, crabwood, bay, palmetto, etc., with a fringe of mangroves. Several vessels were in sight, in the channel and outside the reefs. Those meeting us were beating northward under reefed canvas, but the Rambler, with the wind abaft the beam, had just enough for her cruising rig, and went bowling along with every third drawing in the spinnaker breeze. We passed in succession, leaving them all to starboard, Rodriguez and Tavernier keys—both small ones—and Plantation, Vermont, Upper and Lower Mattacombes and Umbrella keys. Indian Key, a small, but high and prominent one, came next, where there is good anchorage and a number of large cisterns, where water can be purchased by passing vessels. Southwest of Indian Key is Alligator Reef Lighthouse, thirty-one miles S. W. by S. from Caystort Reef Light. It is an iron frame pyramid, showing a scintillating light flash every five seconds, every six flash being red. These lighthouses, built on submerged reefs by iron screw piles, are completely isolated, their keepers being shut off from all communication with the keys except by boats, a few very secluded and semi-hermit life, while exposed to the fury of fierce gales and the lashing of the angry seas.

Florida keys are now nearly all inhabited, and new buildings were being erected on many of them, owing to the "coconut boom." These keys were all being taken up, pre-empted, leased or bought, principally by Key West parties, and set out to coconut trees. As these trees will grow wherever there is soil enough on these rocky keys, and require little or no care after being planted, and as each tree is said to pay at least a dollar and a half per annum after six years old, it will be seen that a few thousand trees would yield a beautiful bonanza in a few years, if all accounts are true. On some of the keys are groups of coco palm trees now full grown and in bearing, and whether they pay or not financially, they certainly add very much to the beauty and tropical appearance of the islands, and viewed in this light the "coconut fever" will prove of lasting benefit to this section.

At Long Key we left the main channel and went inside the main keys to Channel Key, where we anchored at five o'clock under the lee of the key. The route usually taken, it being somewhat shorter, is to go "inside," or on the northerly side of the keys from Long Key to Bahia Honda, from whence the main channel is again followed to Key West. The choice of routes is, however, usually determined by the direction of the wind and the state of the sea. With a northerly or westerly wind, the main channel is the smoothest, being then under the lee of the keys, while with an easterly or southerly wind, the other route is taken for a similar reason. The next morning we set sail at seven o'clock, the wind blowing harder than on the day before, and from the same direction, or a few points nearer east. We passed Grassy, Bamboo, Vaccas, Knight and other keys in quick succession, leaving them to port, and with the strong breeze and smooth water, under the lee, we made ten miles an hour from Channel Key to Bahia Honda. Coming out of the port quarter, but the Rambler, very high in the light, and being under full sail, skimmed the rollers like a sea gull. We did not ship a sea on the whole voyage. The fishing smacks, turtles and spongers were all lying at anchor under the lee of various keys, waiting for better weather.

In plain sight was Sombroero Key Lighthouse, thirty miles S. W. by W. from Alligator Reef Light. This is a conspicuous open frame iron work tower, one hundred and fifty feet high, showing a fixed light visible twenty miles. We now left to starboard Pine Saddle Bluff, Saddlehead, Loggerhead and other keys. Southwest of Loggerhead Key, is the new lighthouse on American Shoal. Passing Cargo Sambo, Boca Obica and other keys and islands, we were in sight of Key West Lighthouse, and off to the southwest, Sand Key Lighthouse; the latter is forty-three miles W. by S. from Sombroero Light and seven and a third miles W. by W. from Key West Light. Key West Lighthouse (harbor light) is in the city of Key West, southern side, a brick tower, whitewashed, and shows a fixed light fourteen miles. Sand Key Light is a revolving flash light. Key West City now loomed up to view with its steeples, towers, and forts bristling with guns. Rounding Ft. Taylor we proceeded to the common anchorage of the coasters and fishing smacks, and dropped anchor at three o'clock, having made one hundred and fifty miles in twenty-four hours of sailing, at an average of six miles per hour. We made everything snug, got the anchor light ready, and put everything in ship-shape order for a stay of several days in port.

Key West, a thriving and prosperous city of some fifteen thousand inhabitants, is situated on the western portion of the island, the latter being five miles in length and about a mile wide. From its position as the "Key to the Gulf," with a deep and spacious harbor, and as a naval depot and coaling station it is a place of great commercial and maritime importance. It has a number of fine residences, churches, and buildings, and a large hotel. The naval depot, the Russell House—a marine hospital, a custom house, and U. S. naval depot. There is a neat and commodious barracks

with well-kept grounds, though the troops are at present stationed at Tampa. There is also quite a large convent, surrounded by handsomely arranged grounds, just outside the city. The cemetery is tastefully laid out and charmingly adorned by tropical trees, shrubbery and flowering plants. The city is defended by several forts, the largest being Ft. Taylor, a brick and stone fortress, mounting some two hundred guns. Steamers for Havana, Mexico, New Orleans, New York, Galveston and the Gulf coast touch here almost daily, beside a great number of sailing vessels. It is but sixty miles to Havana, and some four or five days by steamers to New York.

Key West is a quaint and charming city, full of oddities and incongruities, a veritable town of eccentric "patches." Herein each edifice forms a piece. The buildings of all sizes and of every conceivable style, or no style, of architecture, are promiscuously jumbled together, but are joined or seamed to each other by a wealth and profusion of tropical foliage, which surrounds, invests, surmounts and overshadows them, softening the asperities, taming down the harsh outlines, and uniting the separate pieces, which merge their individuality in a harmonious *total ensemble*.

The modern stilt and bushy Gothic church glares superciliously through the dense, Cuban, Spanish, yellow, and green foliage, at the weather-stained but stout and solid old Spanish chapel, which looks up dreamily and good-naturedly at its prim rival, while the cocoa palm stretches its long arms over it protectingly, the date palm caresses it with slender, green fingers, and the almond tree looks on with conscious pride. The stilted, upstart frame residence, with scroll work hanging from barge-board and eaves, like cheap cotton lace ostentatiously displayed by a vulgarly-dressed woman, looks down laughingly on its little neighbor—a rambling one-story cottage of stone, with broad, projecting roof and cool verandas, almost hidden in a mass of vines, creepers and flowers, which cling to it in loving embrace. The iron-front store, with plate-glass windows, shoulders aside the dark and sombre Cuban café with its cages of singing birds and parrots hanging in the Pride of India trees, and its cool shadows embalm and emblazoned by the bloom and fragrance of the oleanders.

And so, manifold are the styles, the canopies, the porches, the lattice windows, oriel windows, galleries, hoods and pavilions—pillars, columns and pilasters—are mingled in endless confusion, but harmonized by arabesques of fruit and foliage, festoons of vines and creepers, wreaths and traceries of climbing shrubs and trailing flowers, and shady bowers of palm and palmetto, almond and tamarind, lime and lemon, orange and banana.

And its population is as diverse as its structures. Americans, Englishmen, Frenchmen, Cubans, Spaniards, Cubans, Bahamians, Italians and negroes make up its numbers, the majority being Cubans and Bahamians, or "Conchs," as the English natives of the Bahamas are called. Here may be seen every shade of complexion, from white to yellow, brown and black, cosmopolitan all, though each class seems to live in its own particular quarter of the town—as "birds of a feather" mostly congregate in specialized groups—where, after daylight, they enjoy themselves, each class after its own fashion, singing, dancing, and even drinking in its own language. Jack said he learned to drink beer in seven languages while there, which is a linguistic accomplishment that few attain, and fewer enjoy.

But there is a large and popular dance house at the west end of town, which we "took in" for Skipper's benefit, where the harmonizing influences of the place are again exemplified, and where white, yellow, brown and black meet on a common level, and dance and sing and drink in the thronging hours with flying feet to the inspiring strains of a cracked violin and a piano which seems to possess a thousand wires and all loosely hung. And if the test of enjoyment is the energy displayed, they certainly enjoyed themselves to the top of their bent.

But we will take a long and upward step to a nobler and far more attractive scene, where the youth and beauty of the island city are assembled at the "Rink," a large and brilliantly lighted hall in the heart of the town. Here youths and maidens who had never seen a snowflake or an icicle, and who had never heard the merry jingle of a sleigh-bell; but all the same they were gliding along gracefully and smoothly on roller-skates, or dashing around the outer edges on the swift-whirling bicycle to the fascinating strains of the "Beautiful Blue Danube," while the mingled odors of the cape jessamine, the tuberose and the orange blossom floated in the air. The waltzers and the skaters, with a subtle and potent power in beauty, music and flowers! And they had their influence on Jack, who was deeply enamored of a little Cuban beauty; and no wonder, for she was perfectly brilliant and glorious in a wealth of jet-black hair, a clear olive complexion, pouting coral lips disclosing regular and pearly teeth wreathed by a perpetual smile, while her eyes were as black as midnight, with her soul looking up out of their mysterious depths, and her form was even more lovely than her face, and its loveliness was surpassed by her grace. Poor Jack! "Beauty draws us with a single hair," and here he was harnessed to each particular hair of the beauty's head, frizzes and all. We tried to convince him that it was the effect of the music or the fragrance of the flowers, and that he would get over it when he went out into the fresh air; but he answered:

"If music be the food of love, play on;  
Give me excess of it, that, surfeiting,  
The appetite may sicken and so die.  
That strain again! it had a dying fall;  
O, it came o'er my ear like the sweet south,  
That breathes upon a bank of violets,  
Stealing and giving odor."

Then Squire made the only quotation he was ever guilty of, though it did him credit, for it was from the "book of books,"

"Stay me with flagons, comfort me with apples; for I am sick of love."

But he spoiled it all when he added: "But I think it will be better to rub him up a bit with a soft brick."

The chief industries of Key West are the manufacture of cigars, sponging, fishing, turtling and wrecking. There are, perhaps, a hundred cigar factories, from the one-story hut, scarcely bigger than its sign, to the large, airy and extensive buildings, each giving employment to hundred of hands. The cigar makers are mostly Cuban refugees, and the tobacco is imported from Cuba, though for a time some Eastern dealers made a large quantity of domestic tobacco, which injured the trade and brought discredit on Key West cigars, so as to lessen the demand to a consider-

able extent; but, happily, the dishonest practice is discontinued, I believe, and only Cuban leaf is now used.

A large fleet of vessels are engaged in sponging, the crews being mostly "Conchs" and negroes. The sponges are taken in shallow waters, off the reefs and banks, where by means of the "sponge-glass," a wooden pall with a glass bottom, the sponges can be plainly seen attached to the rocky bottom, and to shells, when they are torn loose by a strong iron hook affixed to a long pole. Each vessel tows six or eight small boats or yawls, in which the men work. Some Eastern houses have sponge depots here; among others I noticed that of McKesson & Robbins of New York. The sponges are here washed, dried, bleached and assorted, and are of various grades and kinds.

Every morning may be seen many small fishing smacks, moored stern on along the fish wharf, with their wells filled with live pan fish, such as grunts, porgies, groupers, snappers, hogfish, yellow tails, spots, etc., which are killed and strung in bunches as fast as sold, selling for five or ten cents a bunch, and on account of their cheapness form the principal part of the diet of the working classes. These pan fish are some of them very beautiful, as well as excellent food fishes, and are caught in the channels near the city, principally with the sea-crawfish as bait, for they are all caught with hook and line. The larger smacks bring in kingfish, otherwise known as cero, or black-spotted Spanish mackerel, a large and handsome fish weighing from five to fifteen pounds, almost equalling the real Spanish mackerel in flavor; they are usually taken by trolling off the keys. The fishermen are mostly "Conchs," who are by nature nearly amphibious, learning to fish, to walk, or to handle a boat almost as soon as they are able to speak, or at most, when old enough to wear pants. They are the descendants of the English settlers of the Bahama Islands, and have the cockney habit of changing the "w" to "v." Even a negro, born in the Bahamas, said to me one day:

"The weather ain't no good for fishin', an' the vater is too rough, and the wind too 'igh fur sponging!'"

A number of large smacks regularly supply the Havana market with kingfish and red snappers. By leaving Key West about sundown they are in Havana by daylight the next morning. Had we not been pressed for time, or been in Key West a few weeks earlier, I should have made the run in one of these smacks.

The fruit and vegetables and products brought to Key West from the mainland and keys are always disposed of at auctions, which are held every morning, and are attended by the citizens as regularly as Northern people go to market. If the supply of staples is small, notions and other commodities are sold, for the average Key Wester is not happy without an auction.

We were shown every kindness, consideration and courtesy during our stay in Key West by Mr. and Mrs. Gwynn and their two charming daughters. These young ladies possessed all the advantages of a good and thorough education, being well versed in belles-lettres, music and dancing, and were as refined and graceful as our Northern ladies, though they had never been away from their little island home, having been educated entirely at the convent of Key West.

#### A PLEA FOR RECREATION.

AFTER Herbert Spencer had been in this country a few weeks and had tested the phenomenal qualities of saddle-rocks at Dorlon's, the bills of fare at Delmonico's and the Brunswick, seen the famous trotters of Vanderbilt and Bonner, and whizzed up and down a few times on the Elevated roads, he concluded that we were "going too fast to stand it" and must hold up, or mental and physical decrepitude would ensue.

But seriously, what he said at the banquet given in his honor was as preaching; but who are the men who are breaking down the life of the people in the manner he describes? Not alone those who are apparently in pursuit of the almighty dollar, for all callings contribute their quota to swell the tide that goes down to premature graves. While it is indispensable to success that all the faculties of brain and body should be brought into requisition, it is just here that so many make the fatal mistake of their lives. No man can run his mental machine in one groove long at a time without wearing. Exhaustion of the nervous force and disorder of the body is the certain result of an excessive whipping-up of the tired faculties, and finally prostration ensues. The trite saying that, "All work and no play makes dull boys" is so true that he who runs may read

I can recall a score of bright men, both business and professional, who within ten years have succumbed from simple exhaustion. For awhile apparently tireless, their powers suddenly failed and nought but a wreck was left. At fifty years of age they were indeed "dull boys," and all work and no play had done the business.

Various motives impel men to "dare and die." The heroes of a forlorn hope, the discoverer of a truth the world spurns, the zealot who abandons prudence for principle, may perish on the field of battle, expire at the burning stake, or die by "pendulous strangulation;" yet there may be compensations for sacrifices like these; but the man who virtually commits suicide by the equally certain though slower process of a profligate waste of the nervous fluid, is—well, he isn't smart.

The causes that lead to this undue work are not obscure. We inhabit a comparatively undeveloped country. The natural increase of population, augmented by an unprecedented immigration, forces every capable man to strenuous efforts as a producer. We have to compete with older nations for the markets of the world; they have so long monopolized it. In short, we have to do the work of two generations in one. We seem really unable to "go slow;" we are hustled and crowded forward, until the tax upon the nerves and endurance of the ordinary man is tremendous. It is wise to halt now and then and get our breath, and the ability to do this can be acquired when once the necessity for it is fully comprehended. The trouble is, we do not stop to consider that the daily and yearly wear and tear is killing us.

Very few people die of old age, and the majority die by violence—self-imposed, it is true, but violence nevertheless. The advice of *Punch* is in order: "Don't!"

Thousands owe Mr. W. H. H. Murray a debt of gratitude for the attractive setting out he gave the North Woods. But for those well-written drafts on his imagination, as well as a literal portrayal of facts, scores would now rest under the sod. To be alive and kicking (when the wind isn't in the northeast) is glorious if one feels good. To be able to take time and enjoy it in May and June and September and October, is a matter to be thankful for, so we think the

promoters of the game laws. To be able to handle the swift canoe, the well-poised rifle and that artistic thing of beauty, the light fly-rod, we thank the constructive skill of not mechanics merely, but genuine artists, but for superabundant localities with woods, and all the beautiful things a trained eye perceives in nature's retired places, we thank our Maker.

Now I affirm, and "defy successful contradiction," as a local brawler is wont to say, that "all the world and the rest of mankind in general," ought to be able to use a gun skillfully, and a fly-rod artistically. In that case, the gun works that "Nesbitt" says have "got to go," would have a chance to stay and pay dividends. And the rod makers and a host of that ilk would "smile a smole" all the year round, too, and grow fat and sleek, sport side-whiskers, part their hair in the middle and carry a cane.

I don't see for my part, why more of "you fellows" don't take your wives to the woods with you. They enjoy trout and venison as well as you. You don't own one, ha? Well then, I would take time by the foretop, as the Californian is said to do: "My pet?" "You bet." And straightway proceed to the nearest minister who loves "to go a fishing," hand him a shining piece of the needful and be put in possession of the treasure who can cook your trout, make your coffee, and perpetuate your name.

Referring to Thoreau, I heard Dr. Collier say, a few evenings ago, that had he lived in these days he would have been assured with the appellation of "crank." "Pshaw," how that would sound! "Henry D. Thoreau, crank." "Well, why not have 'woods cranks' as well as any other cranks? To make a thing go well—just a little better than the other fellow—one must be something of a crank." TENNIS.

RIVERTON, CONN., Feb. 9.

## Natural History.

### THE BIRDS OF MAINE.

With Annotations of their Comparative Abundance, Dates of Migration, Breeding Habits, etc.

BY EVERETT SMITH

FAMILY SCOLOPACIDÆ: THE SNIPES, SANDPIPERS, ETC.

179. Woodcock—*Microptern americana* Aud.; *Philohela minor* Ridg., 525, Cs. 608.—Abundant; arrives in March and April. Breeds early, and the number of persons congregated in favorite places, just previous to their departure in the autumn. Now, the same places are so persistently explored by very many sportsmen during the season as to prevent the assemblage of many birds together in any one place; but the aggregate number of woodcock now killed in the State each year vastly exceeds that of former years. While the number of these birds annually killed here has been more than twice increased, the number of persons pursuing them, and among whom those killed are divided, has been more than tenfold increased. For these reasons it is now rarely possible for a single person to kill so many in one season as formerly. During the season of courtship these birds may be observed at dusk mounting high in the air and circling about on whistling wings, pursuing one another, and performing various interesting movements in the air, or they may be seen strutting upon the ground, with upturned tails and drooping wings, much in the manner of a male turkey.

During the migrations all birds are accustomed to signal each other by calls, and the woodcock is not excepted from this habit. It utters a quaint cry, somewhat like *quack*, which is repeated while the bird is on the ground, as also when upon the wing. By this cry passing birds are called to tarry, or tarrying birds are called to join those which are journeying. Immediately after the moulting season the woodcock begin to assemble at favorite feeding places, families coming together from their various breeding resorts, which are often in places not visited by sportsmen. The movements of the woodcock in autumn are quite similar to those of nearly all of our native birds which are migratory. During the period of moulting they are more secluded in their habits than at other times, are timorous as if realizing their weakness at that time, and will seek safety by running and skulking noiselessly away from intrusion, rather than by rising upon wing as at other times. When in the midst of moulting these birds do not emit their ordinary scent, and the best dogs often fail to detect their presence, even when in very close proximity. The birds then resort to the warm, dry hillsides, but always near to suitable feeding grounds. During the daytime they usually remain sequestered away from the notice of man, but at night they are accustomed to seek their food, but as soon as the moulting process is so advanced as to render them strong of wing, again the woodcock will be found in the haunts where sportsmen are accustomed to look for them, if there be food for them. Sometimes their usual feeding places become dry early in the summer, and fail for a time to yield a supply of food. The birds then, from necessity, go elsewhere. But they will return to the same haunts later if the season is favorable.

The woodcock which breed east of Maine remain there in autumn as late as, and often later than those in Maine, but when birds start on their migration to the South long flights are made in a single night, so that only rarely do any of these more Eastern birds tarry in Maine en route. Occasionally a sudden change of weather, such as a snow fall, will stop the birds in their flight, but only for a day or two, the first favorable weather occurs. The movements of the native birds from the many secluded nooks where they have been bred to the coverts where they are found congregating in the autumn, form the preparatory assembling

for migration. Such an assembling is common to birds of other species, the warblers, sparrows, swallows, crows, etc., and usually extends throughout a number of weeks. The movements for assembling are local, and governed much by immaterial local causes, but the actual migration occurs simultaneously over a large territory, the final departure of the woodcock varying but little throughout Maine.

Woodcock are both diurnal and nocturnal in their habits, feeding in dense coverts and secluded places during the day, and going into the open fields, pastures, plowed ground, and meadows at night. They are very active during moonlight, autumn nights, and often seek their food far from any growth of trees or bushes, especially just after a rainfall, which brings the earthworms in the fields to the surface of the ground.

180. Wilson's Snipe—*Scolopax wilsoni* Aud.; *Gallinago melia wilsoni* Ridg., 526a; *Gallinago wilsoni* Cs. 608.—Common. Arrives in April. Breeds on the ground, lays four eggs, brownish, speckled with blotches of light and dark brown, in May. Abundant only during the autumn migrations, which occur in September and October. But few bred in Maine as compared with the great numbers which breed further east. This is the common snipe, sometimes locally termed "English snipe."

181. Red-breasted Snipe—*Scolopax noveboracensis* Aud.; *Microptern grisea* Ridg., 527, Cs. 609.—Abundant along the coast during migrations. The spring migration occurs during the last two weeks of May, when the birds pass by on their northward journey in large flocks, after the manner of sandpipers. At this time they are fat and delicious for the table, but the flight is very brief and chiefly over the sea, so that it is only in favorable places, such as the marshes at Scarborough, and at some of the islands on their route, that many can be obtained. The males arrive the third week of May, and the females, four days or a week later, and all have passed by before the first week in June, and usually before the first day of that month. Early in July a few returning ones make their appearance from the far Northern breeding places. The first arriving from the North are generally adult males, which are followed by their relatives in straggling numbers, rarely in flocks of more than a few individuals, throughout July, August and September. These snipes are locally termed "brownbacks," and are not commonly known here except along the coast.

182. Long-legged Sandpiper—*Tringa himantopus* Aud.; *Microptern himantopus* Ridg., 528, Cs. 611.—Not common, but apparently a regular autumn migrant. No record of its appearance here in spring, and probably it is one of those species which chiefly follow the valleys of the Mississippi River and its tributaries during the northward migration in spring, but during the less hurried migration of autumn a portion of their numbers return along the Atlantic coast.

I append a record of specimens shot in Cumberland county, Maine, all in the Scarborough marshes, excepting one at Cape Elizabeth, and possibly the one recorded for 1870, as the locality is given for that specimen in notes quoted. 1845, three specimens; 1846, one; 1847, one; 1848, eight (possibly three of these were noted in two of the records quoted, and if so, the number for 1848 should be given as five); 1858, two, August 9; 1854, two; 1856, four; 1860, one, September 18; 1866, one, September 21, one September 23; 1868, one, August 14; 1864, one, August 14, one, August 31; 1865, one, September 10; 1866, one, September 16; 1872, one, August 12.

1845, three specimens; 1846, one; 1847, one; 1848, eight (possibly three of these were noted in two of the records quoted, and if so, the number for 1848 should be given as five); 1858, two, August 9; 1854, two; 1856, four; 1860, one, September 18; 1866, one, September 21, one September 23; 1868, one, August 14; 1864, one, August 14, one, August 31; 1865, one, September 10; 1866, one, September 16; 1872, one, August 12.

1845, three specimens; 1846, one; 1847, one; 1848, eight (possibly three of these were noted in two of the records quoted, and if so, the number for 1848 should be given as five); 1858, two, August 9; 1854, two; 1856, four; 1860, one, September 18; 1866, one, September 21, one September 23; 1868, one, August 14; 1864, one, August 14, one, August 31; 1865, one, September 10; 1866, one, September 16; 1872, one, August 12.

185. Semipalmated Sandpiper—*Tringa semipalmata* Aud.; *Ereunetes pusillus* Ridg., 541, Cs. 612.—Abundant during spring and autumn migrations, especially along the coast. Arrives in the latter part of May and early in June. One of the "peeps," and locally known as "black-legged peep," also "winter peep" on account of its presence here in the autumn long after the disappearance of the next named species.

184. Least Sandpiper—*Tringa pusilla* Aud.; *Actodromas minutilla* Ridg., 538, Cs. 614.—Abundant during spring and autumn migrations, and frequents the marshes in winter. Arrives in May. This is the smallest of the "peeps," and arrives here in advance of the next preceding named species, in spring.

185. White-rumped Sandpiper—*Tringa schinzii* Aud.; *Actodromas pusillicola* Ridg., 536; *Actodromas bona partii* Cs. 617. Common in autumn along the coast. Regular autumn migrant, yet the species is not abundant here. Uncommon in spring. The autumn migration extends from the last of July to the latter part of September. Messrs. Harry Merrill and N. A. Eddy inform me that they procured several specimens near Bangor, October 23, 1881—a noteworthy occurrence on account of the late date in the year, and the species is rarely found here far from the coast, although Bangor is on tidal water. I am indebted to my friend, Nathan Clifford Brown, for the sole record I have of other specimens taken in Maine. One shot by Mr. Brown on October 14, and one previous to that date. Mr. Brown has also given me the record of a specimen shot at Scarborough, May 30, 1881. The only other record I have of its occurrence here in spring is that of a single specimen, shot at Scarborough, May 29, 1882. Probably its spring migration is over the ocean, when passing Maine, in company with other shore birds, and it is never seen here in spring migration by such a route, and are never seen on our shores at this season except in rare individual instances.

186. Baird's Sandpiper—*Actodromas bairdi* Ridg., 537, Cs. 615.—This sandpiper is a common Western "peep" and is accorded a rank as a species distinct from the white-rumped sandpiper, which it much resembles. But few specimens have been recorded as taken in Maine. One shot by Mr. Brewster in Nutt. Bull. No. 1, April, 1876; one shot by Mr. Philip G. Brown at Scarborough, September 9, 1875, (N. G. Brown in Nutt. Bull., Jan. 1877); one September 4, and two September 5, 1880, at Lake Umbagog, (Wm. Brewster in Nutt. Bull.).

If the many "peeps" shot here yearly were carefully examined, probably many more would be found referable to this form.

187. Pectoral Sandpiper—*Tringa pectoralis* Aud.; *Actodromas pectoralis* Ridg., 534, Cs. 616.—Abundant in ducks, during autumn migrations. Commonly known as "grass bird," by local sportsmen. This species is so very rarely seen here in spring that I cite the only instances of which I have any records. Locality of observations, Scarborough. Several seen May 8, 1852; one May 11, 1853; one April 30, 1864; one April 13, 1871. The first arrivals of the southward migration are rarely seen before August. During September and October these birds become more abundant on the marshes, and occasionally a few linger here into the month of November.

188. Purple Sandpiper—*Tringa maritima* Aud.; *Argyrotele maritima* Ridg., 539, Cs. 620.—Abundant in November and throughout the winter about the outer islands of the coast, more especially of the easternmost portion of the State. Exclusively a maritime species. Locally termed "rook plover" and "rook snipe." But few of these sandpipers proceed further south than Cape Cod in Massachusetts, and no other sandpipers pass the winter so far north. Their summer homes and breeding places are in Arctic regions.

187. Red-backed or Black-bellied Sandpiper, American Dunlin—*Tringa alpina* Aud.; *Ptilopus alpina americana* Ridg., 539a, Cs. 624.—Abundant on the coast late in the autumn, but very rarely seen here in spring. May 27, 1879, I shot a single specimen, which was detected in association with a flock of "peeps" and "ring-necked snipes" at Scarborough. This was an adult female in the plumage of spring, having the belly black. The name black-bellied sandpiper is given to the bird only on account of this temporary phase of plumage. Like the preceding species, these birds frequent the coast and rocky shores, and are termed "rook snipe" and "bill snipe." But they also resort to the sand beaches, which the purple sandpiper rarely if ever frequents, and are also sometimes found on the marshes. I once shot a specimen, in early autumn, upon one of the marshes of the upper portion of the St. Croix River, which had not completed the moult of its summer plumage. This fact and its presence so far from the coast led me to suspect that possibly a few of the species may occasionally breed in that region. This is not probable, however.

Although somewhat resembling the purple sandpipers in form, the dunlins differ much in their habits. None remain upon our coast during winter, but great numbers pass by and go beyond the southern limits of the United States. I have observed them upon sand islands in the Gulf of Mexico early in May, as they were returning to the North. Probably the greater portion of their numbers went their way to the breeding places in North, via the Mississippi and St. Lawrence river valleys. Those which come along the Atlantic coast in spring leave the shores of Massachusetts, and pass by Maine far from land over the ocean. Cold easterly storms prevailed on the coast of New England during their migration in May, 1882, and dunlins, as also many other shore birds, were driven out of their usual course. A Scarborough sportsman was out May 28, five May 29, one May 31, one June 2, a total of nine specimens, all were in the summer plumage.

190. Curlew Sandpiper—*Tringa subarquata* Aud.; *Ptilopus subarquata* Ridg., 540; *Archibuteo subarquatus* Cs. 625.—Accidental. Extremely rare. Apparently occurs in America only as a straggler from Europe. Audubon found but three specimens in America in all his explorations. One was shot near New York since the time of his visit. Three specimens near the mouth of the St. Croix River. A single specimen was shot at Scarborough, Maine, September 15, 1880, and its skin is preserved and in the possession of Mr. C. H. Chandler, of Cambridge, Mass., who obtained the bird at Scarborough. By the courtesy of Mr. H. A. Purdie, who has examined this specimen, I am assured of its identity.

189. Red-breasted Sandpiper—*Tringa himantopus* Aud.; *Tringa canutus* Ridg., 529, Cs. 626.—Common on the coast during migrations. Arrives in latter part of May. With various other birds of the same family, this sandpiper extends its migration to extreme northern regions. I have seen a specimen of *Tringa canutus* in the ornithological collection of the British Museum at London that was killed at "Seyn" north latitude. The bird is small, and has a crest and lower parts to which is due the name of this sandpiper. It is peculiar to the plumage of spring and summer. Specimens in this phase of coloration are obtained in Maine during the last of May and first of June. When next seen here upon their autumnal migration the plumage appears quite different, and the birds are then sometimes termed "blueplover," the upper parts being bluish gray, and lower parts white. (TO BE CONTINUED.)

### THE HORNED LARK.

BY REV. J. H. LANGILLE.

It was early winter. The ground was covered with snow, but the atmosphere had been laden with a dense falling mist. The temperature falling below the freezing point, throughout the night, a zephyr-like wind from the northeast continued to crystallize the moisture on every object, arraying the landscape in a most magnificent hoar-frost. The delicate plumose or spinulose ornaments increased every twig and spear of grass, in many times of its former size. The trees and shrubs seemed almost as dense as when arrayed in a young foliage; telegraph wires were as thick as cables, and the delicate array of spinulose plumes on the evergreens was of greater magnitude than their own dark covering. The exquisite delicacy and beauty of the pattern of crystallization were indescribable. The whole landscape was a charming fairyland. The light and softness of the scene was so charming, that all the bores of rural and city life had been at work; while in this inimitable role of snow-white purity the Christian minstrel might read the thoughts of Him who is the author of the beautiful as well as of the true and good.

Perfect stillness reigned. The slightest sound was awaking. What could be more pleasing to the lover of nature at such a time than the gentle rustle of the hoar-frost notes of birds? Ever and anon small loose flocks of horned larks (*Eremophila alpestris*) appeared, alighting in the fields and along the highway, and they seemed as social and happy as so many Franchins, as they flew and ran, and squatted and hopped, vying with each other in their soft conversational *tsip, tsip, tsip*.

This is one of the most characteristic birds of Western New York. In Orleans county and westward, throughout

## THE BIG GAME AND THE PARK.

Editor Forest and Stream:

I commend the course taken by the FOREST AND STREAM in the matter of the National Park grab, and your hearty support of Senator Vest's bill, all of which I endorse, except the proposed Park extension. This I deem unwise and unwarranted. This clause in the bill was inserted, I believe, to conform to the recommendation of Lieutenant-General Sheridan in his report of Nov. 1, 1882, to the War Department, which proposes to extend the limits of the Park forty miles east and ten miles south. The extension most would take in a large and rich mining district, known as the New World Mining District (so-called the Clark's Fork Mines). These mines have been occupied for ten years. The entire tract which the bill proposes to take in is a mineral-bearing country. But this matter we will leave to our delegate in Congress. I hope Congress will not grant any exclusive privileges within the limits of the Park; 640 acres would be a very large tract of land, as it could be so mapped out as to take in the entire upper geyser basin, in which are situated nearly all the most wonderful and interesting geysers in the Park. I trust that in granting privileges Congress will not allow any hotel or other structure to be erected nearer than one-fourth of a mile to any of these great wonders, and that a survey may be made and permanent lines established, taking in all the beautiful springs and geysers, and that the same may be forever free. The FOREST AND STREAM has well said that pasture lands are very scarce, particularly in the vicinity of the geyser basin, and for this reason should be free to all. I should think that twenty acres of land with each hotel privilege, would be a very large one, and that this rule should apply to location of such privileges throughout the entire Park.

Much has been said upon the subject of game protection, and I believe that Sheridan recommended the extension of the Park particularly that the noble game of the Rocky Mountains might find a retreat from skin hunters. I herewith submit some figures showing shipments of skins from Bozeman, which has been the principal shipping point of Eastern Montana for many years, which, however, is now somewhat changed by reason of the settlement of the country along the Yellowstone River and the opening of the country for skins. I am sure that you are familiar with all these matters and submit the figures to show what species of game most need protection. In 1874 the following shipments were made from Bozeman:

Elk skins, 97,600 lbs.; deer skins, 82,350 lbs.; antelope skins, 33,497 lbs.; mountain sheep skins, 760 lbs.; moose skins, 4 skins only; bison, none.

Average weight of skins: Elk, 12½ lbs. each; deer, 3½ lbs.; antelope, 2½ lbs.; mountain, 3½ lbs.

This includes the entire catch of skins sold by white hunters and Indians. The average prices being for elk skins 20 to 30 cents per pound, deer 24 to 35 cents per pound, antelope 27 to 40 cents per pound, mountain sheep 15 to 20 cents per pound, moose skins 20 to 30 cents per pound. During the two years following shipments were light, owing to the market being glutted and the price of skins falling. The shipments of one house from October, 1881, until July, 1882, were as follows: Elk skins 43,000 lbs., deer skins 35,000 lbs., antelope skins 5,000 lbs., mountain sheep skins 960 lbs., moose, three skins only, bison, none.

Never within my recollection has a bison skin been offered for sale by a skin hunter in this market, and I have knowledge of but one skin having been brought to this vicinity from the Park. The reason is this: Those are found at all his skin is most valuable. October, November and December—the bison does not leave the high altitudes. Therefore to hunt him is to encounter deep snows; his whereabouts are uncertain, for there are but few herds; his skin is heavy and cumbersome to handle; hence it does not pay the skin hunter to hunt him; for these reasons only he is safe from skin hunters. Tourists and sportsmen, who linger to hunt in the Park, are the only ones who are found at all his skin is in the thick forests of the high mountains, and are not numerous enough to warrant hunting them for their skins. The mountain sheep, from their peculiar habits, flourish in the highest and most rocky and rugged mountains, and if protected during lambing season will take care of themselves and last for many generations to come. Of these animals the bison and moose should be particularly protected from sportsmen and hunters in the summer season, when their feeding grounds are accessible.

It will be seen by the large quantities of elk and deer killed for skins, they are by far the most numerous, and must be soon protected, or it will be too late. Two or three severe winters with deep snows, a good demand for skins with such prices as prevailed in 1874, will seal the fate of the elk and deer of the Rocky Mountains. The all important question presents itself: How can we protect the moose? Surely not by simply extending the limits of the Park; certainly not by any law that Congress can devise for their protection within the Park. I believe this can be accomplished only by the hearty co-operation of the Territories of Wyoming, Montana and Idaho, and the passage of such laws by the Territorial Legislatures as will entirely stop the killing for skins only. Killing should only be allowed from August 15 to the first of November. During the summer season the habits of the elk and deer are such that the first October snows are the signal to descend from the secure summer retreat high up in the densely timbered mountains, even above the timber line, where snow banks are found at all seasons of the year, to lower levels; and as the season advances the journey is continued until the base of the mountains is reached, then the timber lands, then a general clearing—far beyond the timber line. In the summer, the deer, however, remain near its borders, during mild winters, and are killed more or less by skin hunters. Deer do not remain in or near the Park during the winter. The great slaughter, however, takes place along the tributaries of the Yellowstone and Missouri rivers, and goes on unceasingly from November until May, when, as the snow begins to disappear, and new grass starts, such animals as have survived this slaughter turn their faces once more toward the mountains, and follow the melting snow until the summer retreat is reached.

To illustrate how mercilessly game is slaughtered, I will relate one instance that came within my own observation. While traveling down the Yellowstone in the winter of 1880, in the month of February, the snow being deep, sleighs were used by the stage company in place of wagons. There was a crust on the snow, and the driver was obliged to hold my weight. The driver and I discovered a band of antelope in the road some distance in advance of us. At first they were somewhat shy, and would run as we approached, but finally we came quite near them. There being about fifty,

they occupied a long space in the road, and as they became accustomed to us, we came very near them. I would reach out of the sleigh, pick up pieces of snow crust, and throw among them. They would then quite at ease as a flock of sheep. We noticed that the flock of nearly all these animals were badly lacerated, this being caused by traveling and breaking through the hard crust. These animals traveled in advance of us some miles, never attempting to leave the sleigh track. We finally met two hunters, and the animals bounded off through the snow a short distance and stopped. The hunters got down from their horses, and the work of slaughtering began. The antelope were killed in a quarter of a mile distant, five antelope had been killed and the remainder were scattered around, none beyond rifle range. These animals had scarcely time enough left to run from the hunter, even if the depth of snow and crust had not rendered such a thing impossible.

In this way the antelope of the great Yellowstone Valley have been nearly exterminated; and I repeat, that unless a remedy is soon found, the elk and black-tailed deer will share the same fate. The reader will ask, Have you no game laws? Certainly. Section 641 of the Revised Statutes of Montana prohibits the killing of buffalo, elk, black-tailed deer, white-tailed deer, mountain sheep, Rocky Mountain goat and antelope, from February 1 until August 10, penalty not less than \$50.00 nor more than \$250.00. Section 642 prohibits the killing of any of these animals at any time for the skin, penalty not less than \$50.00 nor more than \$250, but these laws are a dead letter and cannot be enforced, for the reason that our Territory is so vast in extent, there being ninety thousand square miles within its borders, with a population of about sixty thousand. Many of the best game districts are distant from settlements, and difficult of access in winter and spring, when it is the most necessary to protect game. Skin hunters locate in the fall before snow falls, and await the arrival of game and take their skins to market until June and July, after the snow has disappeared. The entire United States Army, while it might protect, or partially protect, the 3,344 square miles included in the National Park, would be powerless to enforce the game laws as they now are.

Can a remedy be suggested? In my opinion, your correspondence should be sent to the Government, recommending that the shipment of elk, deer, antelope and mountain sheep skins from the Territory be prohibited, and the passage of laws, making it unlawful for any railroad or steamboat company, or any other common carrier to transport or carry the same from the Territory. That article came from a person thoroughly conversant with the subject in question.

ANGLER.

BOZEMAN, Montana, Jan. 24, 1893.

The Cheyenne Daily Leader, February 8, reports: Public-spirited citizens are at work, independently of the Governor and Secretary of the Territory, endeavoring to bring the United States Senate to a sense of the injustice which would be done Wyoming if the Yellowstone Park were to be placed under the jurisdiction of the laws of Montana. The following letter, from the Hon. Harry C. Crosby, U. S. Senator from the Territory of Wyoming, contains sound arguments from the good authority for the retention of the Park under Wyoming laws:

THE HOME RANCH, CHEYENNE, WYO., Feb. 8, 1893.  
To the Hon. George G. Vest, U. S. Senator, Washington, D. C.

Honorable Sir—Referring to a letter dated December 29, from Gov. Crosby of Montana, to you and believing you are interesting yourself in the preservation of game in the Yellowstone National Park, I address you in the name of the Wyoming Game Protective Association, and, in reciting certain facts, which may be new to you, and in offering a few suggestions, I trust they will be received in the same good spirit of national pride and sport which dictates them. Although sympathizing strongly with the object which prompts Governor Crosby's letter, I fear it has, with its great publicity, tended to mislead, both as regards the geographical position of the Park, as well as the efforts of the good people of Wyoming to protect game for the same. As the large proportion of nineteen-twentieths of the country set apart as a national reservation was taken from Wyoming, the old one-twentieth coming from Idaho and Montana, and as a movement is now being made to transfer the Yellowstone Park to the Territory of Montana, our people are naturally growing jealous. Thus far the only laws of either Territory which in any way affect the interests of the Park, are those for the protection of game near its borders. The Wyoming Territorial Legislature of 1882 enacted game laws, of which the enclosed is a copy. In them will be found embodied all the points Governor Crosby recommends for his Territory. He suggests imprisonment instead of sending to prison, and a fine for punishment for infringement of our laws either, or both. It is urged that transportation companies be prohibited carrying game unlawfully killed. We go a step further and forbid individuals or corporations even to have in possession game unlawfully killed, or any green or untanned hides.

Our people have organized and incorporated a game protective association, which has been working this year with an interesting result, but they have been enabled to accomplish the following results: All common carriers have been forced to refuse contraband game or parts thereof, except in the extreme northern part of the Territory, where such game is transported into Montana, where traffic in the same is apparently allowed. We can furnish proof positive of parties having started from the southern portion of this Territory on hunting expeditions, and returning with game guides (who are not exempted by our laws) killing more game than they could use until they reached Montana, where they were taken across the border to indulge in the alleged sport of murdering buffalo. We know of parties who had made arrangements last year to hunt here, but learning that the Wyoming laws were being enforced, changed base to Montana. Hide hunters and game murderers in the extreme north have openly defied our association, knowing they could find a market and protection in Montana.

As the people of Wyoming have, through their Legislature, made wise game laws, and have also shown their ability to enforce them—at all events more thoroughly than Montana does—it is most earnestly to be hoped and prayed for that if it should be considered necessary to place the National Park under the laws of a Territory, it will be given to the Territory in which it is located. Governor Crosby, and to her whom it was taken, since then shown their pride in what they have practically looked upon as their own by a zealous regard to the preservation of the Park's greatest beauty—its game. If the area of this reservation should be increased, as suggested by Governor Crosby, it would be taken from Wyom-

ing. If the preservation of game is the real issue, the following notes, which are gathered from real experience, are respectfully submitted. In this open prairie country game ranges in a very different manner from that in which they range in the Adirondacks or Allegheny mountains. There a preserve of fifty square miles might be effected; here even the extent of the Yellowstone Park (8,500 square miles) would be virtually useless for such a purpose. Buffalo are apt to wander four or five hundred miles between their summer and winter ranges. Elk, black and white-tailed deer, as well as antelope, leave their ranges to bring forth their young; therefore, preserving a small area would not avail unless the strictest protection in all the wild country is needed; but if anything is to be done it should be done at once.

If the Federal Government would give at least her Territories a general law on the subject, then United States Marshals and their deputies would have to see to the enforcement of the same, and they would also carry against the bands or companies of hide hunters the good, moral weight of having the "blue coats" to back them.

Assuring you of our appreciation of your efforts to secure the preservation of game, I am, yours respectfully,

HARRY CROSBY.

President of the Wyoming Game Protective Association.

## THE GUINEA FOWL AS GAME.

THERE are numbers of guinea fowl wild in the island of Santo Domingo, and they have been there beyond the memory of the oldest inhabitant. They are very prolific. They have often been seen as many as fifteen in a brood. They hatch often in the open air; at least they hatch in any and all seasons of the year. They are to be found about the corn and rice fields, as well as in the open savanna miles away from any food, except such as is afforded by the native grasses. Their crops often show nothing but grass seed of different varieties. They are an exceedingly shy bird, difficult to approach, and wonderfully strong and swift. I have seen them fly from the tame bird as a wild log is from the domestic animal.

On one occasion we made camp late in the afternoon at a cattle station in the savanna, where the proprietors came twice a year to brand the calves and select the heaves, stopping three or four weeks each time. During the rest of the year no one lived there. Near sundown, tempted by the balmy atmosphere and witching lights and shades, I strolled some distance from camp, and saw a very large covey of guinea fowl, promised myself some sport in the morning, and was up and away at the first break of day. After a time I discovered at a distance a flock of guineas feeding in a portion of the savanna where the pine trees were three to four rods apart, tall, straight and free from limbs for a long way from the ground, and not a brush beside. I endeavored to get within gunshot by going from one tree to another, keeping myself as much hidden from sight as possible, and the first time watching the birds closely, and on seeing the least sign of apprehension, making a statue of myself. I spent over an hour in this way, the birds constantly feeding away from me. Then I flushed them out of range and they flew for a run that I densely timbered. I followed but failed to get a shot, and was forced to return to camp without a bird. I do not think that these birds had been shot at for months.

They are harder to get a shot at than the ruffed grouse, but are much easier killed. With a 16-bore 12½ lbs. gun, I shot one from the limb of a small pine tree at a distance of fifty-two long paces, striking the bird with one shot in the body. It fell immediately to the ground; and when I picked it up, was dead. I have shot a green parrot at so short a range that four shot passed through its body, and then I had to resort to other means to obtain a shot.

There were no bird dogs in Santo Domingo at the time I was there. A friend had a mongrel shepherd that he thought a very good dog to hunt birds. I tried him. He would trail the guinea fowl. They would allow him to come quite close, and then take position in the nearest tree and watch the dog. I think from their actions they would like pretty well to the proper kind of a dog. The wild guinea is similar in edible qualities to the ruffed grouse. Although I have bagged a great many, I never saw a very fat one. They were plump, juicy and tender, and a very fine flavor. I had the best success in shooting them by scattering a flock just before roosting time. The following morning, being on the ground before daylight, when the calling would commence, the chances were favorable for a few flying shots.

L. KENT, M.D.

## PHILADELPHIA NOTES.

THE late continued rain has completely freed the Delaware River from ice, and the marshes bordering it which were until the past week frozen up, have been entirely cleared, owing to the high tides having liberated and floated off their hardened covering. Some seasons we have had a return of the marsh ducks to our streams as early as this, but I cannot learn of any baldpates or sprigtails having appeared in the Delaware as yet, although the feeding grounds might be said to be in good condition for them. We shall have some severe weather before spring, and need not look for marshfowl before the first week in March, and not then unless the season is favorable.

I wish our sportsmen would content themselves with autumn shooting alone, and allow the comparatively few ducks which stop in our marshes in the spring, preparatory to going northward to breed, to stay, although the feeding grounds might be said to be in good condition for them. We cannot blame the boys so long as a law permits.

Some few purple grackles and robins have shown themselves in Delaware county, near Media, I am told. This is very early for them. We seldom look for them before March. One of our local papers tells of a "brown thrasher" (feruginous thrasher) that has wintered in Chester County. This is remarkable, as the bird is migratory and passes the cold weather in the South.

Several of our Philadelphia hotel and restaurant proprietors have kept over a number of quail this winter. One has a covey domiciled in his front show window, the bottom of the window being covered with moss, etc., and the quail made comfortable. The birds attract much attention. HOWES.

ASLEEP AT HIS POST.—DRAWN FOR THE FOREST AND STREAM BY W. H. McDUGALL.

## SUMMER SHOOTING.

"Hear the other side," says the proverb.—"Clericus."

Editor Forest and Stream:

In your issue of February 15, laments the restrictions cruelly put on certain human beings called "brain-workers." These poor creatures, as he groups them, are clergymen, college professors, school teachers, lawyers, actors, artists of all kinds, and the "physicians at least of the wealthy classes." [How many "classes" have we in this republic?] This list excludes engineers, whether military, mining, mechanical, or civil, that is if the last named do not meddle with the architects; sea-faring men, baggage-masters, officers of the army, telegraph operators, foreign ministers, street-car drivers, dentists, hotel clerks, members of Congress, dealers in fishing tackle, officers of the internal revenue service and plumbers and pawnbrokers and a few other "classes."

Finding myself in the smaller and more exclusive class, I feel privileged to join the lament with that of "Clericus." "Clericus" asks: "Now is there nothing owed to the above classes?" (That's my class, you remember. You see he starts right, for he puts us, *i. e.*, our class, on the Cr. side of the sheet. The reader will note that the plumber belongs to the class containing the officer of the internal revenue service and the pawnbroker.) "Are there no concessions to be made in their behalf?" "What lover of the chase cares to go to the North Woods if there is no chance on the deer?" This last lament in behalf of my class is no doubt all right, but to me reads a little ambiguous.

My wife, who has just read it, says: "It is all clear enough, it means that 'Clericus' won't go to the woods if the deer have any chance. How stupid! My dear, your brain is overworked." "No, my love, my brain is not overworked—worse than that—I am a victim!" "What? Victim! Haven't I lost any of my money, I hope?" "No, love—don't!—just one moment. I'm the victim of the strange fascination of—?" "Who?" "Who?" "One moment, my darling, of—the trigger." "Oh! that's all, is it?" "Yes, and that's what 'Clericus' says he has badly. Yes, and he says it is hard to get rid of. He also says: 'There is no encouragement for the professional men [*i. e.*, our class, you know, my dear] to give themselves to a recreation which, like sleep, knits up the ravel'd sleeve of care, is balm of hurt minds and chief nourisher in life's feast.' These are his words and he knows. He says I ought to take to the woods and—?" "My dear, I thought you called me to listen to an article you had written for FOREST AND STREAM?" "Oh, yes, I forgot, here it is, short and—well, like yourself, my North Woods woman, my anglertrix."

It is to me, a "brain-worker," incredible how a "Clericus" could have written that article advocating summer shooting. The close season does not suit the time of the vacation of clergymen and others. This is a reason, sufficient to "Clericus," why the game laws should be changed. The law of the land and the law of nature are against summer shooting. The game laws, after much discussion and infinite trouble, have been laid down so that, on the whole,

they follow the law of nature, which fixes certain times and seasons for the bringing forth of young, and for the mother's care for her offspring. To shoot her then, in the fullness of her love, and to leave her darling to the merciless elements, and beasts of prey, or starvation, is a cruelty that no one, if thoughtful, can be guilty of. This is the sentiment which underlies that legislation whose intent is to protect our game during the season of motherly love and of hopeless infancy.

A PROFESSOR.

## MICHIGAN NOTES.

THE winter in this region has been unusually severe. In December there was a depth of forty-six inches of snow at one time, and there are now ten feet or more on the ground. This has no crust, but is very solid, so as to make it difficult for any animal of large size to wade through it. There were a good many deer here last fall, and a number were shot. I do not think many have been killed since the expiration of close time, but a few have suffered. Those who hunt out of season keep it quiet, as there is a strong feeling among many of our hunters that the practice should be discouraged. I learn that one man, living on the "Six-mile" Lake, has captured three or four deer and has them in his barn alive. Probably he has not read the law against "hunting or pursuing" these animals out of season. This same man was once fined for crust-hunting, and his turn may come again.

The deer were hustled about lively enough on the first snows. I knew eight men to meet on the track of one buck, and they didn't get him, either.

There are no quail here. Ruffed grouse have been quite abundant this fall, and there are a good many winter ducks in the open rivers connecting our lakes.

Foxes are abundant and a few are shot. No one can keep hounds here, as the still-hunters always shoot them.

Two or three bears were shot this season; one of them was pursued one day by seven hunters through a swamp covering a few hundred acres. The snow was deep and they gave it up at night, and went to bed. So did the bear. Next day an old hunter went alone and shot him.

We were for several weeks interested in the gambols of three or four otters in and about the open water at the head of one lake, and in the river which empties therein. The same thing occurred two years ago, and although the creatures were often seen within a few rods of the bridge, I do not think that any of them were injured during their stay. Some of the boys tried to shoot them; but you know their guns generally miss or "hang fire." One of them, however (not the boys, but the otters), probably owed its life to the courtesy of one of our best shots and hunters, who had his carbine levelled on it at point-blank range, but refrained from shooting because he knew that if killed the animal would sink and be lost in the deep water.

It has heretofore been my impression that otters seldom remained for so long a time in one place, unless when the young were very small, and it seems strange to me that they should stay so long in sight of a village, and play about in rifle range of a constantly traveled thoroughfare.

CENTRAL LAKE, MICH., Feb. 11, 1883.

## EFFECTS OF SPRING SHOOTING.

THE sportsman that has lived in the Quaker City for the past twenty years can note many changes that have taken place in the shooting grounds in and about Philadelphia county in that time. Where one particular spot was yearly visited by snipe and a fair bag could always be counted on, it has long since been deserted by the birds, and they have to be sought for elsewhere. Who that has shot at all does not remember the meadows bordering Darby Creek, Potts' meadows, the grounds near the Cross Keys and around Captain Scrymgeour's? All were close to the city, where ten or twelve years ago it was a poor day when twelve or fifteen birds could not be killed in proper season. Now a tramp over all these meadows would not start a brace of snipe in the most propitious weather, unless, as it was last autumn, an unaccountable flight suddenly appeared and reminded the old stager of what had been once a common occurrence, especially in the spring.

The writer can call to mind the daily killing in the afternoon, ten years ago, of two or three brace of snipe by Mr. George Twaddell and himself within the limits of West Philadelphia, not a mile from Mr. Twaddell's homestead. This favorite feeding ground is now never visited by the birds, and it is evident their numbers are yearly decreasing, doubtless owing to spring shooting, which we are all guilty of and which we will still indulge in so long as it is allowed by law.

It was common not many years ago to find good woodcock shooting within and but a short distance of Philadelphia. Many birds were killed along the Schuylkill River, and almost every river or creek harbored a pair, and the covers fringing the different creeks in Philadelphia county were sure to be the home of more than one longbill. Some of the Philadelphia readers of FOREST AND STREAM can remember how they once slipped in back of Woodland's Cemetery early of a July morning and brought out two or three woodcock, and can call to mind the excellent feeding grounds on the Cobb Creek running at the foot of Mt. Moriah enclosure. All these grounds are as they once were, not a whit changed. But the birds are not there as of yore. Would it not be wise to abolish all summer woodcock shooting as a means to increase the number of our fall visitors?

Bunting's thicket, long since cut down, and a growth of sapling—now a wood—just outside Philadelphia county limits, on the Baltimore turnpike, was a dozen years ago regularly frequented every autumn by woodcock. Similar good ground lies in the same neighborhood now, but it is seldom a woodcock is found there. We are told that the main cause of this scarcity of snipe and woodcock in the immediate vicinity of Philadelphia of late years may be attributed to the increase of sportsmen, the improvement in shotguns and to the education of the mass in shooting matters by sporting journals. All this may be true in a measure, but the prime reason is the killing of migratory game birds in the spring of the year. Granting that sporting literature has done its share in fostering a desire for field sports on the part of the public, for this very reason it should advocate the total stopping everywhere of all spring shooting, and

The only fish markets of any consequence on Lake Champlain are at Burlington, Vt., and Plattsburg, N. Y., the fish selling for a trifle less on the Vermont side. The hotels do not generally patronize the markets, but purchase direct from the fishermen. Practically all the fish are taken in nets, and those caught after the latter part of April come from the fertile parts of the grand lake, which belongs to Vermont. But the smaller alewives, which are more than fifty in March and April, are set to catch the fish upon and on their way to the spawning beds. Last spring (1882) there were six large saucers in the Mississippi River below Swanton. Few escape to deposit their spawn. The same validations method is practiced in other rivers, and I am credibly informed that for a period of six weeks each year, from June to October, the fish of this species moved down from the north end of Lake Champlain along the shore to New York. Inquiries at Rouse's Point disclosed the significant fact that an average of twenty-five to thirty bar-

rels pass through that place daily "for a period of at least five weeks in the months of March and April." In the spring of 1878 twenty thousand pike died in a small pond in which they were placed to await "a raise" in the market price. The inevitable result of this enormous slaughter to the spawning beds has already made itself felt, and fishing with the hook and line is no longer practiced in places where it used to prove very remunerative.

I feel confident that the above facts, however appalling, constitute but a half-told story—that the enormity of the crime will never be fully known—and it is sincerely to be hoped that the proper authorities will spare neither pains nor cost in bringing the outrageous slaughter to a speedy termination. The food fishes of this magnificent lake are of too great value to the inhabitants of its shores to be sacrificed for the benefit of a handful of worthless outlaws. The time for action is now at hand.

LOCUST GROVE, N. Y., Feb. 15, 1888.

## MAINE NOTES.

Editor Forest and Stream:

Just as I sat at my desk on a beautiful day, August 6, satisfied me that the present Legislature is alive to the demands of the public for laws which will be more protective in regard to fish and game.

The Chairman of the Committee on Fisheries and Game, Hon. J. H. Kimball, of Bath, is himself a lover of field sports and the angle, is deeply interested in all of these matters, and is a gentleman of ability and culture. Also Hon. G. W. McAllister, of Bucksport, of some common sense, Hon. A. G. LeBrock, of Foxcroft, and many other prominent members of the Legislature are anxious to do all in their power to further these important interests and enhance the rapidly increasing business of the people of Maine, which is the result of the "summer travel."

This committee have reported several bills which will doubtless receive a favorable passage in both houses, and which will make a new era in the protection of fish and game in this State.

Among them is the repeal of that terrible nuisance called the "Tank Pond act," amending the law relating to the disposition of the fines and penalties recovered for all violations of the game and fish laws so that one-half will go to societies which will use the funds for the propagation of trout and salmon instead of to the county as now, thus making the law more equitable towards the fishing lakes and ponds which he lawlessly depletes; restricting the transportation of trout and salmon beyond the limits of the State at any time of the year, conferring upon all sheriffs, deputies and constables the powers and duties of game and fish wardens, etc.

The friends of protection to the Maine game and fish may hope for a new order of things here if the bills reported by this committee become law.

J. F. S.

Mosses, Me., Feb. 10, 1888.

## POSITION OF REEL—WEIGHT OF RODS.

I WILL make a reply to Dr. Henshall's letter in FOREST AND STREAM of February 8, but have no desire to enter into a wordy war with him, nor with any other person. My remarks to Mr. Jordan, which roused the Doctor's wrath, were intended to instruct one who claimed to be a novice. If any one cares enough about it to look over Mr. Jordan's letters, as published, they will find that he was praising a rod as "unsurpassed on earth," and at the same time acknowledging that it was the first bass rod he had ever used. His lack of skill is managing a reel placed behind his hand, the only fit place for it on a light rod, led me into writing for his "enlightenment."

If Dr. Henshall has not been an advocate of heavy rods then the inferences were wrong which I and others have drawn from the very pertinacious correspondence between himself and Mr. Van Sicken, when both those gentlemen seemed to forget what was due to those who honestly differ with them. The tone of his last letter wherein he belabors me and lurs epithets at my "ignorant" head, led me to decline to answer it at first, but that course might lead him to think that he has effectually squelched me.

In our striped bass fishing we use the reel in front of the hand and cast a half grown trout from an ounce to an ounce and a half, with a stiff eight-foot rod. All who have cast in this manner know that when Mr. Jordan casts "a half-grown broom," or Dr. Henshall tells in his book of casting an ounce-and-a-half minnow, that it takes a stout rod to do it. When I answered Mr. Jordan that "for the style of fishing that he aims at he is right in placing the reel in front of his hand," and again when he asked how one can cast a minnow "à la Henshall" in any other way, and I replied that he could not, I then saw that this style was the height of his ambition and that he looked up to the Doctor as the father of all bass fishing. My reply was intended to mean "enough said, if that is what you want it will suit you." It does not suit me to throw an ounce-and-a-half minnow at a black bass, with any sort of tackle. If it pleases Mr. Jordan and Doctor Henshall to have no objection, only they should not attempt to enlighten the world on bass fishing in a delicate manner. The splash of a "half-grown broom" may be music to some anglers while to others it might arouse of coarse fishing.

I am not ignorant, as far as reading goes, of the style in which Dr. Henshall fishes, and, begging his pardon, I do not like it. I claim the right to have opinions and to express them. I have read some of the Doctor's letters, especially his "Around the Coast of Florida," but I cannot say that I admire the style with which he treats those who dare to differ with him. His book may be of value to an ichthyologist—of that I do not pretend to judge—but it is badly defaced with advertisements in the reading portion, and will never rank high as an authority on bass fishing. He makes long scientific disquisition between the two species of black bass, and then tells the world on bass fishing that they are all one. The stupid big-mouth appears to finish him as much sport as the quick-fighting small-mouth.

I did not intend to go into such a criticism of the worthy Doctor, and will not again reply to what he may have to say. In his last he charged me with "false hypotheses, wilful assumptions and gross misrepresentations." A week has passed and he has not forwarded any apology for the language, so I will not readers of FOREST AND STREAM to please excuse him, he will feel better some day. I certainly hope that he will find none of those terrible things in this answer, and will settle down to the belief, however much it may hurt his self-love, that at least one man who claims to be a fair bass angler does not think that the highest style of the art is "à la Henshall." FLORIDIAN.

## BAIT-CASTING IN NOTTINGHAM STYLE.

WE have received a book entitled "The Nottingham Style of Float Fishing and Spinning," by J. W. Martin, (the "Trent Otter"), published by Sampson-Low, Marston, Scarle and Rivington, 188 Fleet street, London, E. C. This is something which we have been desirous of seeing because we have heard so much on the "Nottingham style" of casting at the English tournaments, and had an idea that as the cast was made from the reel it was similar to our sea coast or "Cuttyhunk" style. A picture on the cover shows a man casting with the reel on the under side of the rod, and with his right hand below the reel, checking it from over-running with the forefinger. Other cuts show that some line is pulled off before the cast, as in fly-fishing, and one figure shows two such loops "in order to make an extra long cast." This would seem to be a much poorer reel than our coast fishers use, which run like a fine watch, without friction.

The book is devoted to what in England are termed "coarse fish," a term which includes chub, barbel, roach, perch, bream, carp, tench, dace, gudgeon, etc., and has a chapter on pike fishing. In reading of the "Nottingham" style of fishing we learn that the rod is as light as possible with a spring in the middle of the handle, and a turn of the wrist—and it is nicely balanced. It is made in three joints, the butt is red deal, the middle piece of the same wood and lancewood spliced together about one-third of the distance from the top ferrule, and the tip is made entirely of lancewood. It is a little over twelve feet long. They are sometime made in as many as six pieces, but the author wisely prefers three. The reels are usually of wood and are in two pieces, the barrel of the reel turns upon a spindle in the center and spins freely. Fine silk lines are used, floats of quills or cork, and a gut casting line completes the equipment. After casting in ground bait and having baited his hook the author says: "We will now suppose the swim the angler has selected is from twenty to thirty feet from the bank, and he is fishing with very light tackle, too light to be cast from the reel (the reel would not revolve sufficiently for casting with such a light spin) and that he cannot coil it upon the grass at his feet, nor allow it to hang loose from the reel; the fine line he is using would twist and tangle it up. He cannot reach the swim with the rod, and what line there is hanging from the point. What is to be done? A Nottingham angler holds the rod in his right hand, and with his left takes hold of the line as high up the rod he needs the rings as he can reach, and draws down as much line as he requires. He then has some four or five yards of line in his left hand, and with what is hanging from the point of the rod he can throw the distance he requires, which he does by bringing the rod away from the river at about an angle of 45°. He then sends the point of the rod smartly over the river, at the same time letting go of the line he holds in his left hand, and the line will go fair and neatly to its destination without tangle or catch."

Again we are told "if the Nottingham bottom fisher uses a cork float and a heavier tackle, he mostly throws his bait from the reel, that is in a manner somewhat similar to Jack spinning. He winds up the line until the float nearly touches the top ring of his rod, and then gives it the desired swing over the river."

Illustrations of the several fishes are given, but they are not good, being much like those in Walton. Directions are given for taking them, and the floats and hooks are shown also. The price is two shillings.

## MCCLOUD RIVER TROUT.

IN answer to the very interesting article on McCLOUD River trout by Mr. Livingston Stone, in FOREST AND STREAM for Feb. 1, permit me to offer the following:

So far as the collections sent to the National Museum permit us to form an opinion, there is, in the Upper Sacramento, but one species of black-spotted trout, and this species is *Salmo gairdneri*. There is also a red-spotted trout or char, the so-called "Dolly Varden," *Salvelinus malinus*. The small or "dace-scaled" trout of the mountain brooks, is, we think, the same species as the river trout, and Mr. Stone seems to be quite right in supposing that the "younger and smaller trout affect the brooks and the larger and older trout prefer the river." In many streams, where food is scarce, or conditions unfavorable, this species reaches, when full grown, only a very small size. I obtained specimens in this San Luis River country, California, and found that the largest of them will not weigh three ounces. We suppose that if these little trout were transplanted to the McCLOUD, their progeny, at least after a generation or two, would be large like the McCLOUD River trout, while the latter would certainly be dwarfed if removed to the San Luis River.

As to the scaling of the two forms. I find no real difference and doubt if any exists. The fineness of the scales in the brook fishes is evident to the eye, but there is no difference in the numbers, either lengthwise or crosswise, when we come to count them. Mr. Roosevelt is quoted as saying "that the distinctions between the McCLOUD River and the mountain trout are quite apparent to the eye," and "that there is some difference in their habits." Both these propositions, I grant. The first is dependent on the second, and the second is due to the necessities of the case. Change the surroundings and the appearance of the fish will disappear, and these differences are apparent only, not affecting any of the specific characters of the species. These remarks are based on the supposition that the National Museum has a full series of McCLOUD River trout. If this supposition is erroneous, we stand open to correction and conviction.

The *Salmo purpuratus* or "Clarke's trout," the common trout of Washington Territory and of the lakes of British Columbia and Montana, etc., is quite different from the rainbow trout. It grows much larger, has a much larger mouth, and is, in my opinion, altogether a superior animal and better worthy the attention of fish culturists. It can be readily distinguished from the rainbow trout by its more numerous (i. e. smaller) scales, there being about 130 in a lengthwise series instead of 130. When fresh, there are two crimson blotches on the under side of the lower jaw. This is an excellent mark for dissection for one who does not like to take the trouble to count the scales. The famous trout of Lake Tahoe is a variety of this species. A few specimens have been taken in the Lower Sacramento, but the species has never been traced up to the McCLOUD. DAVID S. JORDAN.

INDIANA UNIVERSITY, Feb. 15, 1888.

A NEW SHARK.—Last week Mr. Blackford received a telegram from Prof. Baird asking him to attend to forwarding a large basking shark caught at Amagansett, Long

Island, and shipped by the lighthouse keeper at that station. This is an early response to a request by the U. S. Fish Commissioner addressed to those in charge of life-saving stations, to report to him at once at Washington the presence of marine animals on the coast—such as whales, porpoises, blackfish, grampuses—as may be stranded on shoals; also, to inform him of schools of mackerel, menhaden, bludfish, porpoises, or blackfish making their appearance after prolonged intervals along the coast. This letter has been indorsed by S. I. Kimball, the General Superintendent of the United States Life-saving Service, and keepers and crews at the various life-saving stations have been notified to comply with the wishes of the Fish Commissioner. The fish arrived at Mr. Blackford's station in a most unfortunate situation. It was not the basking shark, as supposed, but a strange one, and proved to be an entirely new species of shark, inasmuch as it is the first specimen caught on our coast. It has been found, so far, only in deep water off the Portuguese coast, and is known as the *Pseudotriakis marmorata*. The shark was 9 feet 6 inches long and weighed 180 pounds. The mouth was without teeth, and pharyngeal teeth quite distinct from the snout. It had the ordinarily shaped tail of the shark, but its dorsal fin is not more than five inches high from the dorsal line. This shark had been heretofore known from a single specimen described by Cuvier, in 1867. Dr. Bean states that the teeth are no longer than those of the common skate, and have three points. The taking of this rare specimen is the result of the request that the Life-saving Service should communicate with the United States Fish Commission in regard to fish of strange appearance which might come under their notice.

OHIO.—Windsor, O., Feb. 14.—We have been catching quite a number of muscullunge in a stream known as Grand River; it runs through Ashland county and empties into Lake Erie, in Fairport, Huron county. We commenced trolling for them about two years since. They are not plenty as we scarcely ever get more than three or four in a day. —S. S.

## LORENZO PROUTY.

At the last meeting of the Massachusetts Fish and Game Protective Association, the following resolutions were adopted:

### RESOLUTIONS.

By the death of Lorenzo Prouty the Massachusetts Fish and Game Protective Association has lost one of its earliest and most beloved members; and it is fitting that it should pause in its work and express its appreciation of the worth and character, and extend to his family in this, their hour of affliction, the sympathy and reverent sorrow felt for one whose presence at its meetings and at his place of business was a joy and sunshine to all who knew the simple beauty of his life, his truthfulness, his helpfulness and his kindness of heart. Therefore be it

Resolved, That this Association, admiring his noble qualities, his fondness and enthusiasm for those innocent and healthful pastimes, which we his companions and friends prize in union with him, his humble submission while we deeply deplore the sad and sudden ending of a life that, though about to assume greater and greater responsibilities, would, if it had been prolonged, have filled a larger sphere and developed into greater usefulness and happiness.

To her, who has shared with our departed friend the duties and pleasures of life, who has been his fond companion in his journeyings to lake and stream, ready at all times to rejoice in his success and sorrow at defeat, to her and to the one whose pride and joy it was to call him father, to their dear happy home has by this bereavement been dealt a cruel blow, passing upon that waiting threshold with bowed and reverent heads, unwilling to intrude upon such sacred grief—we bear our consolation in the sweet and hopeful lines of our own beloved New England poet:

"We see but dimly through these mists and vapors.

Ain't these earthly damps

What seem to us but sad funeral tapers

May be Heaven's distant lamps.

"There is no Death! What seems so is transition:

This life of mortal breath

Is but a suburb of the life-eyasion

Whose portal we call Death."

Resolved, That a copy of this tribute be placed upon the records of the Association, and a copy sent to the family of our deceased associate.

C. W. STEVENS,

W. M. BRACKETT,

C. E. FIERCE,

DANIEL NEEDHAM,

Boston, Feb. 7, 1888.

(Committee on Resolutions.)

## Fishculture.

### CARP AND MOSQUITOES.

DOES the food carp feed on the mosquito in its larval form of "wiggler" and "tumbler"? From a fact that came under my observation last summer I am decidedly of the opinion that they do. My carp ponds, four in number, are located in Ocean county, N. J., in the cranberry region, where, as is well known, mosquitoes do abound. Three years since I constructed a pond of about five-thirds of an acre but in short dry weather, but when they were full there they came to my supposition that this would not tend to diminish the supply of mosquitoes. Last May I placed in this pond a few carp, received from the Government the preceding autumn. In August last, when bitter complaints were uttered all over the country at the abundance of mosquitoes, we had very few, so few indeed that my attention was arrested by it. Beside, some carpentermen in my employ at the time reported that while on their way to my place they were nearly eaten up by the pest, but when they returned there they came to be annoyed by them. So I am inclined to place carp among the benefactors of our race. The female mosquito, as is well known, deposits her 250 to 350 eggs on the surface of quiet water. These hatch out in a few days, and are known to many country people as the "wiggler." In ten to fifteen days these are changed into "tumblers," in which form they remain from five to ten days, thus spending from fifteen to twenty-five days in the water before they leave the Government of the air and acquire their musical and phlebotomizing capacities. The carp doubtless find their larvae most palatable tidbits, that are greedily sought after. In one particular the chosen habitat of carp and mosquitoes are alike, both delighting in quiet, warm waters.

By the way, my carp did reasonably well last season, notwithstanding the circumstances under which they were placed were anything but favorable. More minnows of an inch or two in length were received from the Government at last autumn a year, when changed to a larger pond in October last I found them to vary from twelve to fourteen and a half inches in length, and to average about one and a half

scatter the round bullets when shot through the same barrel? (Some breech-loaders do not, I believe, shoot the round bullet.) As to Mr. Berg's fact's conclusion that there is "no perceptible preference" in the shooting of the muzzle-loader and the breech-loader, we feel compelled to say plain: on this point, and especially for short hunting ranges. For the same caliber, the muzzle-loader carries much the lightest bullet, which has much less friction along its barrel, and it can shoot with the same amount of powder in proportion than the breech-loader. Its bullet, therefore, has more velocity than the breech-loader, and thereby its curve is less, and thus it shoots the straightest as a hunting rifle. It shoots the straightest at short ranges, mainly because the center of the bullet is the most perfectly sealed in the center of the bore, the very thing the breech-loader tries so hard to approximate in its barrel (we believe) where great accuracy of shooting is the thing desired. Remember, that two things (1) steady shooting, and (2) a flat trajectory, are actually necessary in a good hunting rifle. Steady shooting is but about one-half the requirement, and flat trajectory the other half.

Question VI.—Is not this true to the letter? It is impossible to place, as many try to do, the two kinds of rifles on a parallel as to shooting qualities, especially when the bullet is shot from the shell. If the muzzle loader does not give the straightest and best shooting for a hunting rifle at ordinary hunting distances, why do so many old hunters lay aside the breech-loader and resume the muzzle-loader? Why is it the public voice proclaims that the hunting breech-loader makes comparatively a high trajectory and is subject to scattering its bullets more or less when shot? Even at Cressbrook, where it shoots its very best, with its specially uniformity of aim, and the cry of the "unaccountable" and "eccentric shots," known under the name of "goose eggs." Who ever heard of these modern names in connection with the good old muzzle-loader? Not old Henry Cressbrook nor Captain Van Dyke. Scott, to be sure. Who ever heard the charge of not shooting steady laid as the door of a good muzzle-loader when shooting at its proper range? Not the writer certainly, and he has tried to shoot them for fifty years. The hunting bullet of the muzzle-loader is either the light round one, or the light "conical," so-called. These are the two lightest bullets used in any rifle, and they can be made to have at short ranges, and generally do have, the highest velocities of any, and this, combined with steady shooting, gives the muzzle-loader and best shooting of any rifle now used. The breech-loader bullet is only an attempt at approximation in lightness to the muzzle-loading bullet, but I think am correct in saying that they are considerably heavier than the muzzle-loading bullet, and therefore with the same charge of powder and equal caliber of rifle, they have less velocity than the muzzle-loader for ordinary hunting distances. We acknowledge that the breech-loader has many advantages over the muzzle-loader, and that it is elegant in its place, but when we come to steady and the straightest shooting (along the whole line) using its hunting or fixed ammunition, and to a flat trajectory, both of which are actually necessary to give the best shooting, then the breech-loader is not there by a long way, and it is idle to attempt to put it there.

One hundred yards is the ordinary, and I may say the standard range of the rifle; for they are generally sighted point-blank for this distance. All small arms of the United States are so sighted for the standard range, and I presume this is generally the case in all countries. Thus, one hundred yards has been the ordinary limit of ranges for the rifle, and it is so now, and has been for many years. For over fifty years. Yet I am most willing to extend it to one hundred and forty yards, for a good muzzle-loader carrying from sixty to eighty round bullets to the point-blank range for this distance will fire its bullet with about as much steady and steady and steady and steady for two hundred yards, and much over. But he is a very unwise hunter, indeed, who would shoot at any kind of game over one hundred yards, providing there is a reasonable chance of lessening the distance by crawling up to it.

I have been all through this "muzzle" of shooting at game over one hundred and forty yards, and with a rifle that is sighted for two hundred and fifty yards. But it did not take me long to learn the great folly of shooting at game over one hundred yards, and I believe I have learned it from the mouths of many old hunters. I have seen many a hunter who would shoot at a deer, and sometimes hunted to learn their craft, would always turn over to me the shot, provided the deer was over eighty yards off. This was the extreme limit that I would shoot at, and I have learned in this rule, though many will scout the idea. When shooting less than one hundred yards I preferred the round ball, sixty to the muzzle-loader, for it gave more penetration. At one hundred yards I found by experiments made thirty-nine years ago in the Choctaw hills, that the muzzle-loader bullet carried much more weight than the round ball, and that it was much more steady, and that the elongated bullet required to be loaded with care in order to shoot steady; that I could leave the muzzle-loader bullet to whom I would shoot, and it would vary a little. This fact clearly shows why the breech-loader shoots quite unsteady; the bullet does not always come out of the barrel in its center, and the muzzle-loader bullet, as we have seen, Van Dyke, "The Still Hunter," has correctly given the reason for this, so I will pass it by. My point here is, that up to one hundred yards the muzzle-loader is much better than the breech-loader, and that up to this point the light bullets of the muzzle-loader shoot much better than the heavier bullets of the breech-loader, and that the charges of powder being proportional to the weights of the bullet. As before stated, the muzzle-loader can beat the breech-loader in all ranges of powder, for it is much more steady, and its bullet is lighter, its friction along the barrel much less, and its recoil less. We know the muzzle-loader does give the straightest shooting of all rifles, and the elongated bullet of the muzzle-loader is much more steady, simply reasons based on the maxims and principles of the science of gunnery. Another maxim is that solid shot shoots steadier than hollow shot. This explains the superiority of the muzzle-loader in the shooting the straightest and steadiest, and having less recoil, and the three main reasons why it is liked the best by many sportsmen in general, especially in the country, where the muzzle-loader is used east of the Mississippi river. But in the great plains of the West and among the Rocky Mountains for large and sometimes dangerous game, and in the country where the muzzle-loader is much better than the breech-loader is much better; nor would I do without it in any country, nor in war. I would not detract one hair from its great merits.

To test these different arms to learn which shoots the straightest or makes the longest range, they should be shot at steady aim, say for 100, 150 or 200 yards, and their merits as to steady aim and good shooting be noted; this is one point gained. They should then be shot at mid-range (55-60) where the muzzle-loader is slightly better with the aim as in the first trial, on the center, and without changing the elevation or load, and their merits again noted—this is the second point gained. Now, let us suppose that both rifles are shot at the same distance, the higher, or gives the higher curve. This will be the case, and the one that makes the light curve with an ordinary hunting load of powder beats the other, and the best shooter is the muzzle-loader. It is here where the muzzle-loader comes in to score its best point, next to steady shooting. Try it and see! The muzzle-loader is much better than the breech-loader in the weight of its bullet. But, as before stated, the muzzle-loader can use with the same recoil more powder than the breech-loader and quicker powder, for it has a light ball with but little friction, and no shell to destroy it. In fact, the lightning express rifle vs. the "express rifle."

I give here a specimen of a country shooting match for an ox by the muzzle-loader and round ball at 40 yds., off-hand (no hip rest allowed) open shots, nine consecutive shots, the rifle loaded in the old-fashioned way, and at which muzzle-loader Bar was the loser. The shots were measured at the time from the center of the bullet hole to the center of the target, by Isaac Bechtel and Andrew Ucker, the latter being the referee. The muzzle-loader was the winner, which is still in possession of Mr. Bar, and authenticates the match. Mr. Bar's string was as follows (one of Mr. Bar's competitors had two consecutive misses):

First 7 shots (centers) total string 56 in. average 1-1 in.  
First 8 shots (centers) total string 124 in. average 1-6 in.  
First 9 shots (centers) total string 181 in. average 2 in. nearly.

The above score was made in 1853, and he then offered an oxen supper to any one beating it. The offer is still standing—muzzle-loader or breech-loader. The muzzle-loader is "again heard from." Step in, gentlemen, with the breech-loader, shoot this shooting and win the supper. I will double the quantity of oxen.

What! Eight center shots out of nine, or thirteen out of eighteen, including the competitor's shot. Now screw these two barrels in a vice and shoot at a target at 100 yards, and you will find that both would not shoot in the same hole all day, or that the muzzle-loader does not shoot perfectly accurate? This was simply a small affair, and the muzzle-loader was the winner. The muzzle-loader whole country was settled with a class of men who owned their trusty rifles, and who could shoot much in the same way. Those old-fashioned hunters have been written down as "old-fashioned" and "old-fashioned" in a few modern rifles are found in their places. Unsteady shooting in the breech-loader and a high curve I believe to be the main causes.

No. 1.—Muzzle-Loading.

The above diagrams, both representing but one target, show the muzzle-loader beaten. (See Nos. 3 and 4). The dotted circle in No. 1 shows the size of a silver dollar and not the center of the target. I have added this circle, but only to give an eye view and in connection with the illusion.

No. 2.—Muzzle-Loading.

The above diagrams, both representing but one target, show the muzzle-loader beaten. (See Nos. 3 and 4). The dotted circle in No. 1 shows the size of a silver dollar and not the center of the target. I have added this circle, but only to give an eye view and in connection with the illusion.

No. 3.—Breech-Loading.

The above diagrams, both representing but one target, show the muzzle-loader beaten. (See Nos. 1 and 2). The dotted circle in No. 1 shows the size of a silver dollar, and is the same circle presented by Mr. Berg, and which I have regarded as the center of the target aimed at, still I much doubt it. The outer circle I have added in connection with the illusion, but this does not change the result of the shooting.

No. 4.—Breech-Loading.

The above diagrams, both representing but one target, show the muzzle-loader beaten. (See Nos. 1 and 2). The dotted circle in No. 1 shows the size of a silver dollar, and is the same circle presented by Mr. Berg, and which I have regarded as the center of the target aimed at, still I much doubt it. The outer circle I have added in connection with the illusion, but this does not change the result of the shooting.

With unsteady shooting the interest is gone; there is no room for perfection, no room for rivalry. Costly rifles that do not shoot well do not give satisfaction to the shooter. So, brush up and improve these breech-loaders if you ever wish to sell them through the country. Return from the long-range, and give us a good hunting rifle. This is what the public wants; they do not generally care a snap of the finger for long-range shooting. It is worthless in practice, so they say to me, and I say amen to it. Not one in a thousand cares for it.

It is a question beyond doubt that the affections of the old hunters after full trials are still with the "plain old muzzle-loader of our fathers." It is in most cases their choice now, nor will they consent to cast off this, their first love, for something more tawdry, but less true to them.

It is said the "muzzle-loader will go under." If it does, it will go with the highest record of any rifle in shooting, and its epithet shall be excellent. M. H. W. Mearns.

New Rochelle, N. Y., Feb. 9, 1883.  
I have seen the above, I learn through Mr. Berg, that the muzzle-loader target as given above, should be increased "just one-half," in order to be correct. Very well. This added fifty per cent. to the illusion which I have exhibited above, and this serves only to make the case so much the worse. In the meantime it leaves the muzzle-loader triumphant at every shot by measure, and the breech-loader flag still hanging at half mast. H. W. M.

## RANGE AND GALLERY.

BOSTON, Feb. 17.—At Walnut Hill to-day the rifleman had some good shooting until afternoon, when the wind increased to such an extent that it was next to impossible to hold on the target. Some of the very good scores, however, were made, among the best being the following, all at 200 yds.

GALLERY SHOOTING.—The second week of the regular monthly prize shooting at the Massachusetts Valley, Boston, has been a very brilliant shooting, the best for any one week since the gallery opened for the season. Mr. J. Francis heads the list in the All-Comers' match, and the prize is now open at the Frelighuysen Range. All clubs will begin at 8 o'clock sharp and the time limited for teams (35 hours) will be strictly enforced. There are now over 200 men connected with rifle shooting in the city, and any of the above clubs are open for outside challenges.

NEWARK, N. J., Feb. 19.—The March Tournament of the Newark Rifle Association will commence on Monday evening, Feb. 25, at the Warren Range, cor. Lehigh and Bank streets, club shooting in the following order: Nameless, Domestic, Essex, Plymouth, Frelighuysen, Warren, and Celluloid. Second teams will follow as in last tournament. A prize tournament is now open at the Frelighuysen Range. All clubs will begin at 8 o'clock sharp and the time limited for teams (35 hours) will be strictly enforced. There are now over 200 men connected with rifle shooting in the city, and any of the above clubs are open for outside challenges.

Worcester, Mass., Feb. 15.—The members of the Worcester Rifle Association, who went out to Fine Grove Range to-day, had to encounter a cold, raw north-west wind. In the several matches now in progress, the following are the scores made to-day:

Cressbrook.									
St. James Clark	5	4	5	4	5	4	5	4	4-43
J B Morse, Jr.	4	4	4	4	4	4	4	4	3-40
J N Freeman	4	4	4	4	4	4	4	4	3-40

CAMDEN, N. J., Feb. 15.—The Fourth Private Shooting Match was held this evening among the members of the Penrose Society at their club rooms. There were twenty-two members present, besides many visitors. The order of prize winners was: F. Woodson, W. Stein, Jr., E. Amsternuhl, L. S. Howell, S. Martin, J. Bosch, W. Fahrion, W. Thompson, C. Preuss, P. C. Smith, G. E. Wenz, J. Hunsong, H. W. Stein, J. S. Jacobs and P. C. Smith. Mr. Hoff was awarded the leather medal. There was also a team shooting. Edw. Amsternuhl being captain of one team and W. Stein, Jr. The following is the score:

In progress, the following are scheduled to be on the road today.									
Credentialed									
Stedman Clark	5	4	5	5	4	5	4	5	1-4
J N Morse, Jr.	4	3	5	5	1	5	1	5	1-4
J N Freeman	4	4	4	4	5	4	5	1	1-4

C. Freusch	9	7	7-14	W. Fabbion	9	5 12-17-22

## THE TRAP.

MARLBOROUGH, Mass., Feb. 14.—At the Marlborough Range to-day there was a hard contest for the State badge of the Massachusetts Rifle Club. The contest was between the Worcester Club and Marlborough Sportsmen's Clubs, the latter holding the badge, they having won it last fall in a contest with the Worcester Club. The Perry was Major F. A. White of Worcester, and Frank L. B. Smith, of Marlborough, T. C. Fielching, of the Malden Gun Club, being referee. The balls, 10 in number, were thrown from a rotary trap. The Perry was the winner, and the Worcester Club was defeated. The following is the score which is claimed to be the best on record in a race of this kind:

Worcester Team.									
G J Rodgers	1	1	1	1	1	1	1	1	1-9
M D Gilman	1	1	1	1	1	1	1	1	1-9
P Holden	1	1	1	1	1	1	1	1	1-9
W B Perry	1	1	1	1	1	1	1	1	1-9
E T Smith	1	1	1	1	1	1	1	1	1-9
Marlborough Team.									
W B Fay	1	1	1	1	1	1	1	1	1-19
T J Beaudry	1	1	1	1	1	1	1	1	1-19
W B Perry	1	1	1	1	1	1	1	1	1-19
George B Clark	0	1	1	1	1	1	1	1	1-18
O B Rush	1	1	1	1	1	1	1	1	1-18

## WORCESTER VS. MARLBOROUGH.

THE match for the State Association team badge, between the Worcester and Marlborough Clubs was shot at the grounds of the Marlborough Club on Wednesday the 14th inst. The Marlborough won the badge of the Worcester Association by one score, 19 to 18. The following is the score which is claimed to be the best on record in a race of this kind:

Marlborough Team.									
H W Eager	0	1	1	1	1	1	1	1	1-18
H S Fay	1	1	1	1	1	1	1	1	1-19
T J Beaudry	1	1	1	1	1	1	1	1	1-19
O B Rush	1	1	1	1	1	1	1	1	1-18
Geo Clark	0	1	1	1	1	1	1	1	1-18

WORCESTER, Mass., Feb. 15.—The members of the Worcester

## BOATS.

THE average yacht's boat is a cranky consumptive affair, distinguished for lacking in the very qualities most to be expected, and not entitled to admiration unless in the light of a poor copy of a Whitehall waster boat. The tenders and gigs slung to spiderweb davits aboard most our yachts provoke a smile and compassion when trying to reconcile their gaudy race boat build and the hard service a yacht's boat is continually undergoing. As in the vessels to which they belong, speed and speed only has been mined at by the talent in the river front shop, and this with a coat of bright paint, some fancy fixings thrown in here and there and a name displayed in huge letters on the sternboard, constitutes the standard universally accepted. Real worth, adaptability to purpose, the yacht's boat of the present has next to none at all. She is narrow, high-bilged with much dead rise, great sheer, low waist and small carrying capacity. She pulls easy and fast, but neither is wanted and should be kept secondary in scheming out her form. As a consequence our tenders are dangerously tipsy, easily swamped, can stow very little, and as life boats to escape from the yacht, to effect a rescue or to assist some one in distress they are beneath contempt.

The first thing an ideal yawl boat or tender should possess is sturdiness and dryness. To this end she must be wide, have long, flat floor, small draft and little weight, and above all be high in side, and capable quite as well as in the ends. She must be well put together of light stuff accurately fitted, clinch-fastened with copper throughout. Her stern must be kept broad to carry the bearings well aft. She must be fuller in form than usual. Finally, if possible, air chambers and various minor provisions of a lifeboat should be grafted in her construction. The next thing to be sought is good carrying capacity. A tender is used for the conveyance back and forth of skipper and guests, often also for carrying ice and stores and water, sails and gear, and room and buoyancy are therefore more essential than a fancy mold for speed. In short, service and not speed should be the dominating consideration. In large yachts swinging a number of boats, one devoted to show and speed as a fancy gig, may be permitted, though even then the number available in case of disaster is seriously diminished, for the average schooner's gig could hardly be depended upon in ugly weather or in a line of breakers. A small iron centerboard is always a useful appendage, and if placed well forward partly under one of the thwarts, will not be in the way and often contribute to boxing about harbors, or save labor when anchored a distance off.

For very small yachts an additional feature must receive attention. To tow a yawl boat is tedious and damaging to property. Hence a form must be adopted which can readily be stowed on deck without sacrificing stiffness and good service. This is no easy thing. As a solution we offer this week some general cuts of a peculiar boat building by Stephens for the four-ton Aneto. This plan is a cross between the canoe and "sneak box," the object being to obtain something narrow enough to fit into the yacht's gangway, ready for use at all times and also stiff and safe. The features of this boat are a "shoved nose" to facilitate towing when preferred, rather small beam, well bed and over aft, long flat floor, quick bilge and high side with a light deck and coaming canoe fashion. The shape of the molds at three cross sections are shown by the dotted lines.

She is 9 ft. long, 24 ft. wide, 1 ft. deep in center with a sheer of 2 in., and supplied with an iron centerboard and triangular sail 7 ft. on foot, head and leach. The board is of 1/4 in. boiler iron with 1 ft. vertical drop. The sail is set upon a short stump pole after the plan of the Lord Ross lateen for canoes.

A boat of the ordinary style, but extremely serviceable, we also illustrate with two diagrams. From these it will be seen she possesses great width, with long, flat floor and high sides, tumbling home at the stern and along the side. This tender belongs to the three-ton cutter Teal, and is remarkable for the load she carries and for her stiffness, which makes her a more reliable and useful adjunct than many dingies twice the length. She is only 6 ft. 6 in. long over all, with an extreme beam of 3 ft. 1/2 in. Her fault is towing heavily when sailing fast, and the difficulty of stowing on deck on account of her width. But, on the whole, she is much nearer what a tender ought to be than the crazy imitations of the Whitehall boat.

Collapsible or folding boats there are innumerable. Few of them can be recommended as they are crank and complicated. The objection to their use lies in the fact that when wanted in a hurry they have to be expanded at a loss of time which may be very precious in serious cases. The best style of folding boat, occupying the least room when stowed and the simplest and quickest to put into shape, is probably the new model now being perfected by the Osgood Manufacturing Company of Battle Creek, Mich., which we hope to speak of more in detail at an early day. That such a boat is wanted by the owners of small yachts we know from the number of inquiries reaching us, and we believe the new Osgood will supply the long-felt want.

## FIRST IN IOWA.

Editor Forest and Stream:

We organized a canoe club in July, 1882, for which we claim the first honors for Iowa; and we are now organizing the Iowa Canoe Club as a State association, of which you will receive notice in due time. The club formed last year we call the Potowonok Canoe Club, of which the following are the officers: Commodore, Dr. John H. H. Vice-Commodore, Mel. O. Warner; Treasurer, Chas. H. Peters; Secretary, Will H. Ailee.

[The future of canoeing in America is assured. The sport appeals to every one within a stone's throw of any kind of water. Few there are in America who cannot reach a streamlet, river, lake or the sea within a short walk. The Iowa clubs will be welcomed as additional members in the great family, and to their enthusiasm in a good cause we look for many new swimmers of the biades, now over from people who now fight shy of the water like old hens.]

NEW YAWL.—Commodore Wynn, Jersey City Y. C., has a very handsome model, made by Snellgrove, for a yawl 30 ft. on deck, 20 ft. load line, 10 ft. beam and 4 1/2 ft. draft, from which he intends to build in time for the season. The boat is a keel, will have outside weight and yawl rig.

## A SPORTSMAN'S VIEWS.

Editor Forest and Stream:

It would hardly occur to you that an old still-hunter and canoeist would be the man to follow most closely the controversy between catboat and cutter, shoal water and "outside" cruising. But no man has more closely followed your articles, diagrams and arguments, than the present writer. As regards the deep, narrow cutter, you are well right. A catboat has no business beyond the lightslip. A cutter like the Neva—well handled—ought to be able to double Cape Horn.

And you discount the catboat too heavily. She is the result of our peculiar waters. "Take your eye and throw it along" our coast line from Maine to Florida; tell me just how many thousands of miles you count up of sounds, bays, inlets, etc., etc., all safe inland cruising, so to speak, and all most delightful pastime for the outer, who doesn't care to risk gales, cyclones and other manly and energizing chances that are quite likely to drown him. The catboat—the "skimming dish"—is just the boat for these pleasant inland waters. She is not a deep sea cruiser; she is the natural result of a natural demand, and of course the thing is overdue. She is not a deep sea cruiser; she is always over-spared and over-splashed with canvas; she is backed up for outside cruising by her admirers, and she does better there than an old sailor would expect. But her place is sounds, bays, quiet waters. There she has no superior—even in a race. But don't take her to sea, unless you are insured for more than you are worth. And yet, knowing these points years ago, I was within an ace of starting for the Amazon River, in June, 1850, in a Penny Bridge catboat. I think, cutting her rig down more than half, I should have made it. Even now I am sorry I did not try it. On the Amazon she would have been a model cruiser; and I should have tried it, only "bully Charlie Coleman," one of the original crew of the America, backed out at the last moment.

He said: "We can get through easy enough, but look at the comfort of the thing, cooking, eating, sleeping—and forty days of it at that."

I went down to the Amazon in the Ed. Burnett. Coleman sailed as mate of the Gersh, Banker. I think yet he would have done as well to stick by me. I have not seen him since. I only wish I had a slice of the money that some fortunate fool spends yearly on wine, woman and horse. I would take a cutter of the Neva type from New York Bay to the Amazon, make a two years' cruise on that river and its tributaries, come home, and make a book.

(It would really entice a man to that much.)

But brains go one way, money another.

I suppose I must content myself with a cruise in a ten and a half pound canoe next summer, which is quite as risky as a cruise in a cutter on the outside passage to South America in May or June. En passant, on a cruise of that kind I would reduce the sail to jib, main-sail and driver; area of sail entire, 500 ft. Ballast, all comprised in lead keel, 4,000 lbs. Setting aside cyclones, pomposes, etc., such a yacht, well-handled, would live longer than an ocean steamer of the narrow Clyde type.

And my dear old boy, wouldn't there be something grand and ganey in such a cruise?

Ah! I have the pluck—the ability. I can navigate, can handle tacks and sheets, can write up the log, but lack the money.

**WILLIAM READ & SONS, Boston, Mass., Agents for New England States.**  
 We also carry a large stock (at all seasons) of Kynoch's regular thickness brass shells, adapted to the Berdan Primer. Price materially lower than the American make of same quality.

# FOREST AND STREAM.

## A WEEKLY JOURNAL OF THE ROD AND GUN.

TERMS, \$4 A YEAR. 10 CTS. A COPY. |  
SIX MONTHS, \$2.

NEW YORK, MARCH 1, 1888.

VOL. XX.—No. 5.  
Nos. 39 & 40 PARK ROW, NEW YORK.

### CORRESPONDENCE.

THE FOREST AND STREAM is the recognized medium of entertainment, instruction and information between American sportsmen. Communications upon the subjects to which its pages are devoted are respectfully invited. Anonymous communications will not be regarded. No name will be published except with writer's consent. The Editors are not responsible for the views of correspondents.

### SUBSCRIPTIONS

May begin at any time. Subscription price, \$4 per year; \$2 for six months; to a club of three annual subscribers, three copies for \$10; five copies for \$16. Remit by registered letter, money-order, or draft, payable to the Forest and Stream Publishing Company. The paper may be obtained of newsdealers throughout the United States and Canadas. On sale by the American Exchange, 449 Strand, W. C., London, England. Subscription agents for Great Britain—Messrs. Samson Low, Marston, Searle and Rivington, 188 Fleet street, London.

### ADVERTISEMENTS.

Only advertisements of an approved character inserted. Inside pages, nonpareil type, 25 cents per line. Special rates for three, six and twelve months. Reading notices \$1.00 per line. Eight words to the line, twelve lines to one inch. Advertisements should be sent in by the Saturday previous to issue in which they are to be inserted. Transient advertisements must invariably be accompanied by the money or they will not be inserted. Address all communications,

With its compact type and in its permanently enlarged form of twenty-eight pages this journal furnishes each week a larger amount of first-class matter relating to angling, shooting, the kennel, and kindred subjects, than is contained in all other American publications put together.

### THE PARK GRAB.

THE fight for the protection of the People's Park still goes on. Although not much has been done in Washington toward the passage of Senator Vest's bill, its friends have made strong efforts to accomplish its objects. On the 17th of February, Senator Vest submitted a resolution, which was ordered to be printed, as follows:—

Resolved, That a committee of five Senators shall be appointed by the President pro Tempore of the Senate, whose duty it shall be to examine and report to the Senate, at its next session, what is the present condition of the Yellowstone National Park, and what action has been taken by the Department of the Interior in regard to the management of said Park, and the leasing or contracting to lease any part of the Park for building hotels or other houses thereon. Also, what legislation, if any, is necessary to protect the timber, game, or objects of curiosity and interest in said Park, and to establish a system of police, and to secure the proper administration of justice therein.

Said committee shall have power to sit in vacation at such times and places as they may think proper, to send for persons and papers, and to employ a stenographer, the expenses thereof to be paid out of the contingent fund of the Senate.

And until said committee shall report by bill or otherwise, the Secretary of the Interior is requested to take no action in the matter of leasing or contracting to lease any part of said Park for any purpose, and to cause any cutting of timber, or erection of hotels or other buildings by any person or corporation, to be discontinued within said Park.

The Secretary of the Interior is also requested to take immediate action for the protection of the game and objects of interest in the Park, and to this end he is requested to call upon the proper military authorities for such force as may be necessary to accomplish such purpose.

This resolution has been called up at least once, but before a vote was reached on it, the time expired, and, Mr. Windom objecting to the postponement of unfinished business, the resolution went over.

It is easy to understand the reason of the objections by the Senator from Minnesota. It is generally believed that he has a direct monied interest in the Improvement Company's plans, and when it comes to a question between the success of this gigantic steal and the good of the people, he

naturally takes the side of his own pocket. Even if it is not the case that Mr. Windom is a shareholder in the Improvement Company, there is another reason for his fighting against the public welfare. Mr. H. P. Douglass, who is one of those to whom the worthy Assistant Secretary Joslyn tried to make the original scandalous lease, is the brother-in-law of the ex-Secretary, and so the latter places himself at the head of the ring and unblushingly rises from his seat in the Senate to combat the rights of the people whose interests he has sworn to defend.

We have already more than once adverted to the methods pursued by the lobby of the "Improvement" Company, and a late attempt of theirs to blacken Senator Vest emphasizes what we have said on this subject. A despatch was recently caused to be sent to a New York paper, stating that Mr. Vest's bill was drawn in the interest of the "Improvement Company," and by its own attorney. A foul accusation was thus made, but the falsehood had but a brief life. Senator Vest promptly branded it as a lie, "wifut, malicious, unmitigated, made out of whole cloth from beginning to end." He further said that he drew the whole bill with his own hand. Such a denial, while it had to be made, is not needed by those who are acquainted with the Senator from Missouri, or by such as have from the beginning watched his firm patriotic and high-minded opposition to one of the greatest outrages which has ever been attempted on the long-suffering and much-swindled American people.

The fight is now to stave off legislative action as long as possible. The reason for this is clear. These trespassers upon the Nation's pleasure-ground have, in defiance of all law, boldly invaded this Government reservation, have cut down the timber belonging to the United States, have slaughtered its game, have set up their sawmills on its waters, and erected stables and buildings upon its lands; they have entered the Park and seized it, treated it as if it belonged to them, and now they impudently laugh in the face of the people, and proceed to make further "improvements," as if indeed all the execrations which have saluted them as they have gone on were merely the mutterings of a distant storm which would soon blow over. They feel that the longer they can hold the Park, the stronger becomes their position and the better will be their chances of ultimately securing an impregnable position there. They reason, too, that if they are finally expelled, they will have claims on the Government for their "improvements," and will make a fat thing out of this, even if they do not accomplish their grander robbery. And Mr. Windom, United States Senator and sometime Secretary of the National Treasury, lends himself to these nefarious plans, and aids and abets the schemers. Is it not a sight to make every American blush to see one who has held such exalted positions enacting the rôle of a lobbyist-in-chief to such a gang of men?

They will carry on the fight as long as they can, for the prize for which they are striving is a rich one, and what do they care for the people, so long as there is a prospect of lining their own pocket? In the meantime, however, new friends of the people are arising. In the House, on Friday last, during the consideration of the Sundry Civil Appropriation bill, Mr. McCook, of New York, when the clause relative to the Yellowstone Park had been reached, moved to strike out the provision authorizing the Secretary of the Interior to lease portions of the Park, under certain restrictions, and proposed to substitute for it a proviso prohibiting the Secretary of the Interior from leasing any portion of the Yellowstone National Park to any person, company or corporation for any purpose whatever, and further, declaring of no force nor effect any lease, agreement or exclusive privilege or monopoly already granted or entered into, and authorizing the Secretary of War to make necessary details of troops to prevent trespassers or intruders from entering the Park with the object of destroying the game therein, or for any other purpose prohibited by law. The amendment was adopted.

The next day Senator Vest submitted to the Senate an amendment to be offered to the Sundry Civil bill calling for an appropriation of \$25,000, to enable the Secretary of the Interior to protect the game and improve the roads in the Park.

All these steps are in the right direction, and will accomplish much good, but it is extremely important that the employés of the "Improvement Company," which has seized the Park, should be at once treated as the trespassers that they are, and should be, without the loss of further time, ejected from the Park.

We are inclined to believe that the Secretary of the Interior has full power, if he chooses to exercise it, to call

on the War Department for troops to aid in this work. When a lot of colonists seeking desirable homes invade the Indian Territory with the purpose of occupying lands held by the Government in trust for the red men, troops are sent after them, they are arrested and brought back. The present state of the Park is similar. A band of men, actuated by greed of gain, have invaded and taken possession of lands held by the Government in trust for its own citizens. Why should not such trespassers be punished, not only for their invasion, but for their robbery of timber and game? Heavy damages should be collected from this "Improvement Company" for the ruin that they have wrought in this beautiful region.

We receive frequent advices of the killing of game in considerable quantities within the Park. A recent number of the Bozeman *Academy Courier* speaks of a contract for 1,000 pounds of wild meat given out by a Cook City firm at fifteen cents per pound, and the hunters are going into the Park to kill it. Rules and regulations are all very well, but there must be some power to enforce the rules and regulations which have been made. Mr. Conger and his assistants are of themselves powerless to prevent violations of the law. Troops are needed in and about the Park, and some sharp punishment should be meted out to these marauding meat and skin hunters as well as to the Park grabbers. For the present several small details of troops are required in the Park, as well as other larger bodies to patrol its outskirts, but after the immediate and pressing necessities of the time shall have been attended to, another and better system of policing for the protection of the game and of the geysers and of the forests may be suggested.

Just now, however, the Secretary of the Interior should call for troops to expel the jobbers who have seized the Park, and the almost equally criminal and reckless skin hunters.

Will Mr. Secretary Teller earn for himself the thanks of the people by doing this?

### THE MARKETS AND THE GAME.

FROM Maine to Minnesota come the same reports. The game is killed in large quantities out of season and shipped by market hunters to the open game markets in other States. Minnesota grouse killed out of season have gone to Chicago, and Maine venison killed in the close time goes to Boston. The Boston market is legally open by reason of an unwise compromise made with the dealers of that city when the present law was enacted, and the Chicago market has been illegally kept open through the combined influence of the dealers and some of the sportsmen of that city.

Last week we noticed the fact that the Chicago market men, notably a prominent member of the Sportsmen's and Game Dealers' Association, were receiving grouse which had been killed contrary to law in Minnesota; and in another column of this issue will be found a report from one of our Maine correspondents, of the shipping of unseasonable game from that State to the Boston market.

There is nothing about this state of affairs to excite surprise. Every intelligent man who has given the slightest thought to the subject, knows perfectly well that a game market open beyond the legal season for killing game means that the game will be supplied contrary to law. It is the same old story, rehearsed time and time again in every State in the Union, and in the Provinces beyond. The relation of the game market to the game supply is well understood, and earnest efforts have been made to provide some efficient check to the slaughter. Michigan sportsmen, after careful investigation, found that their deer supply was being exterminated by the market hunters, who shipped the game to the great city marts. Michigan thereupon passed a non-export law. Other States have adopted similar laws. The sportsmen of Indiana saw their game netted and snared by pot-hunters and sent to outside markets in season and out of season. They secured a non-export law which has since been declared unconstitutional. Minnesota tried the same expedient; it has not proved efficient. Nebraska, Dakota and Colorado, Connecticut, Iowa and Missouri followed, each with more or less good effect. The Province of Ontario contemplates a non-export law. To strictly enforce a non-export game law is an exceedingly difficult undertaking. There are many devices well known to the market shooter, and by means of various deceptions it is an easy thing for him to run his contraband goods through the lines. So long as game markets are kept open, inviting the law breaker to send in his plunder, just so long will the

game be butchered and smuggled out of one State into another. The only correction of the abuse is the absolute prohibition of the sale of game in the close seasons, which generally obtain in the districts of game supply. The Boston and New York markets should not be kept open for months after the Maine and Minnesota open seasons have expired, nor should the St. Louis and Chicago dealers be permitted to pay premiums to the grouse snarers and deer butchers of neighboring States. It is a much simpler undertaking to stop the open sale of game than to detect its covert illicit transportation. If the market is closed the shipping will be stopped.

As we have already said, the Chicago marketmen's plea is that if they do not sell the game other markets will. New York dealers say the same, and the Boston men reiterate the argument. Now the right thing would be to close all of these markets upon the expiration of the open season for killing game in the respective States. If the supply of game proves too great to be disposed of in the prescribed period, let the dealers refuse to receive it from the pot-hunters. It is a very easy matter for them to regulate the supply. They will never do this, so long as they can get legislation to suit them, or can evade the laws themselves or else secure such evasion by other parties. The marketman wants all the game there is, and he wants it all now. A compromise between sportsmen and game dealers means a tinkering of the law to suit this improvident greed of the market. The Boston compromise some years ago proved it; the New York "refrigerator bill" proved it again; and now the proposed Illinois amendment affords a fresh illustration.

We have noted with much surprise the proposal to open the Chicago game market for the reception of game illegally shipped from other States, for that is what the contemplated amendment to the Illinois law practically amounts to, and we trust that the real sportsmen of that State who have no grist of their own to grind at the dealers' mill will stand out most decidedly against the change.

#### PROFESSIONAL MEN AND GAME.

IN our issue of February 15 we printed the plea of a professional man—a clergyman—for summer shooting. Last week was published a reply, written by another professional man—a professor in one of the prominent educational institutions of the country. To-day we give another letter on the same subject, written by one who belongs to none of the classes named by "Clericus." Our own views on summer shooting are so well understood that there is no necessity of rehearsing them here.

We appreciate very fully the value of angling and shooting as rational recreations, in which the hard-working professional man of this busy age may find much-needed recuperation. It would certainly be most fortunate if this class, as well as the working men of all other classes, could shoot deer and birds in mid-summer. But, very unhappily, the laws of nature are irrevocable and cannot be altered in favor of any class, however deserving it may be. If the mother of the tender, helpless fawns be killed, the fawns must perish, no matter whether the man who kills her be a doctor of divinity or a refugee from the sheriff.

And—we regret to say it—professional men, as a class, have not and do not conduct themselves while in the woods very differently from other people. They certainly have given no warrant for allowing to them greater privileges than are permitted to men of humbler stations in society. On the black-list of Maine summer deer-shooters are the names of two men who belong to the same profession with "Clericus." If they hunted deer and moose when the law forbade it, what would they not have done had the law been off?

THE NEW YORK LAW.—A bill to amend the law of New York has been prepared and introduced by the State Association. It provides for several changes in the open seasons, among others permitting July woodcock shooting. As we have already discussed the merits of the subject, we need not go into it here. Another provision extends the season for sale of game through the month of February. There are abundant reasons why such a proposition should be opposed; we have stated some of these considerations in another place.

FOOD OF FISHES.—At the suggestion of Prof. Baird, who desires to have more knowledge concerning the food of our commercial fishes, Mr. E. G. Blackford will institute a series of investigations into the stomachs of those species which come to him in Fulton Market. To this end he has secured the service of Prof. Henry J. Rice, well known from his experiments in oyster hatching, who will record the contents of the stomachs of the fishes, and report upon the food found therein at different seasons.

THE CARVER-BOGARDUS MATCH.—It has been held by very many that while Dr. Carver was a phenomenal rifle shot, he could not hold his own in a match with Capt. Bogardus at the traps. The result of the Louisville shooting showed pretty conclusively that the Doctor knows how to hold a gun as well as a rifle. A full report of the event will be found on another page.

## The Sportsman Tourist.

### FLORIDA.

WHEN winter with his icy hand  
Has spread o'er all our Northern land  
His cold white robe of snow;  
When all the woods are bare and brown,  
And all their feathered songsters flown,  
And fierce the north winds blow.

When summer with his joys has fled,  
Its pleasures o'er, its flowers dead,  
And ice-bound is each stream,  
'Tis then my wandering fancy flies  
To a milder land 'neath sunnier skies,  
And of its joys I dream.

My fancy turns to that bright land  
Where Ponce de Leon and his band  
Of Spanish soldiers held,  
Sought for the Fount of Youth—a draught  
Of whose clear waters he who quaffed,  
Would never more grow old.

Ah, Florida! sweet land of flowers,  
I stray in thought beneath thy bowers  
Of dark moss-mantled pines;  
I breathe the fragrant, rich perfume  
Of flowers in perennial bloom,  
And ever fragrant vines.

In those embowered vales is heard  
The note of many a bright-plumaged bird  
In Northern clime unknown;  
Those dark lagoons are the safe lair  
Of many a creature strange and rare,  
That haunt their depths alone.

Beside St. John's slow moving stream  
Low cofts and broad white mansions gleam  
'Mid palms and orange trees;  
And in the low fertile plain,  
Wide fields of grain and rustling cane—  
Bend to the balmy breeze.

Thy broad sea shores in thought I tread,  
And now through tangled swamps I tread  
My slow and toilsome way;  
Or, happier thought, in my light boat  
Upon thy crystal lakes I float,  
And catch the filmy prey.

Still fate my waiting fortune binds  
To regions of harsh chilling winds,  
Where frost rules half the year,  
And yet methinks some day I'll see  
That land, wash'd by a Southern sea—  
That land to fancy dear.

NORMAN B. DRESSER.

### NIMROD IN THE NORTH.

BY LIEUT. FRED'K SCHWATKA, U. S. ARMY.

#### IV.—Nimrod with a Shotgun.—Part Two.

IN no place in the world is aquatic life so abundant as in the polar regions during the summer. The instance I have given of the elders in Terror Bay is but one in many constantly encountered in polar literature. The little auks, or rogers, says a writer who has been in Spitzbergen, are so numerous that he has frequently seen an uninterrupted line of them extending to a distance of more than three miles, and so close together that thirty have fallen at one shot. This living column might be about six yards broad and as many deep, so that, allowing sixteen birds to a cubic yard, there would be four millions of these little creatures on the wing at one time. This number may appear greatly exaggerated, but when we are told that these auks congregate in such swarms as to darken the air like a passing cloud, and that their chorus is heard distinctly at a distance of four or five miles, these numbers do not appear so great.

The dookies are the most numerous of the summer ducks in the northern part of the bay, and they are especially thick about Depot Island, whose Esquimaux name is Pike-u-lik, meaning the island of birds' nests, and where the dookies deposit their greenish-blotched eggs in innumerable quantities. They seem to mate no nest whatever, but crawl in under the broken granite boulders and lay in such concealed places that a white man will look over a large tract and find nothing, and a few Inuit children will follow and fill their hands and pockets. The first year, '78, we were too late for their eggs, which are here collected in countless scores in July; but that same year, on the 5th of September, we visited Pikkukuk, and some of the Esquimaux we had with us collected about fifty of the quails they caught in the rocks, and then old enough to eat, and gave them to us. Colonel Gilder and I attempted to kill a few of the older ones with our shotguns, but with less success, as they soon scampered some two or three hundred yards out to sea, where they resolutely persisted in remaining while we were on the island.

While on the "Polaris" expedition, Joe, who had been out hunting in February, reported seeing three dookies in the open water, saying that they were the young of last year, and that it was well known among the Esquimaux that this species of bird spent their first winter in the Arctic regions. Joe spoke to me of this also, and added that when they remain they turn almost white like the ptarmigan. I have never seen any in the Arctic, but my journeys have been such that I should easily have overlooked my observation. The skin of their feet and legs is of a beautiful bright red, and quite noticeable when they are sitting on the rocks near the shore. The native women take their feet, as well as those of other web-footed birds, remove the bones, infuse them, and allow them to remain so until dry, when they are filled with rendered reindeer tallow (*loodnoo*) which is then dealt out to their children as candy.

The Esquimaux take great pleasure in hunting small game without a shotgun, and it must be the true spirit of the Nimrod that prompts them, for the returns in pounds of food can in no way remunerate them for the time lost and cost of powder and shot. I have several times seen Esquimaux have the preference of shot or bullets in exchange for some article they desired to trade, and they would invariably choose the former, with which they would probably not secure a dozen ducks, while with the latter they could certainly secure as many reindeer, walrus or musk-oxen.

Toolooah enjoyed a good duck-hunting tour with all the eagerness of an amateur in the art.

We will not speak of the phalaropes, the dabchicks, the grebes, the sandpipers, the gulls, the snipe and the whistlers of the water-loving varieties of birds, for we only saw them here and there without adding any knowledge of their habits, and seldom added any of them to our "bags." The Esquimaux of some localities that I visited, separate the year into moons instead of months, (that is about thirteen months) and each one is named after some event conspicuous at the same, as the arrival or departure of some of the migratory birds, the goose month, the dovekie month, and so forth.

To the sportsman who finds pleasure in pursuing the ptarmigan, the pheasant, the prairie chicken, or grouse, probably the Arctic grouse or ptarmigan would be his first effort with the shotgun as soon as they put in their appearance, for they seem to be exceedingly hard to find in summer. At this season of the year the ptarmigan's plumage is of a pale brown color, mottled with small bars and dusky spots. The head and neck are marked with broad bars of the latter color. I noticed, while on our sledge journey, that it was particularly the stormy weather that brought us in contact with the many bands of ptarmigan who seem to enjoy this sort of bluster; and they cheered the dreary waste of winter when nearly all other life had passed its journey for the more congenial South. With his brother of the black coast—the Arctic raven—he is the only living winged thing that remains on the land to cheer the deep Arctic winter. Long after the great flocks of dovekies, the noisy loons and stately flying burgomaster gulls have departed from the North, the ptarmigan may be found diligently searching the barren rugged hills for his daily food.

In the summer time or breeding season, they are rarely seen, and then have a plumage so much like the prevailing color of the mossy plains as to afford them splendid protection. They are then only seen singly or at most in pairs, but as winter time approaches they flock together often in bands of hundreds; their plumage is then of a pure white, and they are so heavy that they waddle along like fat farm ducks. The sportsman at this time seldom has much trouble in securing ten or fifteen out of a flock, for when frightened they fly but a short distance, and for five or six times after firing they will allow him to approach quite closely. Where hunted considerably with firearms, however, they become as shy as any of the grouse family in warmer climes. Their greatest hunter by the Esquimaux, unless the opportunities are brought directly before them while in their pursuits. I have often seen the small boys using them for a target when practicing with bows and arrows, and they were occasionally successful in securing one in this way, driving them along the ground like so many chickens in the poultry yard. It is said that the Greenland natives hold the idea that ptarmigan, in order to provide for their winter food, gather in a supply of berries into the hollows of rocks, and during very severe cold they form retreats under the snow and bunch together to keep warm. This would hardly coincide with the facts that I have seen them seeking their food at all months of the year, and at all temperatures of the winter, unless their habits vary in the two countries. They are excellent food and taste very much like the partridge of our species in the lower zones. I have never heard them utter any cry beyond a coarse clucking when waddling along on the ground in front of a person, and my queries from the natives failed to extend my information. I have noted this simply because it has been represented that this bird has a most singular and extraordinary voice, which it exerts only in the night time, and instances are given where superstitious people have been frightened beyond measure by hearing it. So white is the plumage of these northern grouse that when squatting in the snow a person even searching for them may get within two or three yards before he sees them, if he be not apprised of their position even by their rapid woodcock-like whirr of their retreat. Especially is this the case in the cold, blustering, snowy weather, when they are the most like the snow.

But bird-life is not the only kind of game in the frigid zone that furnishes food and fun for the double-barreled smooth-bore. There is the Arctic hare, the fox, the lemming, and a few other four-footed but small fellows, which are valuable for palate or peltry, and generally the most sagacious of all. Every now and then when on our sledge journey we saw several of these little dogs, and at their cars, would suddenly prick up their ears, and if the sledges were light, dash forward after some unknown object which would finally resolve itself into some insignificant rabbit trail, and as this boreal bunny is somewhat predisposed to the storniest of weather, like the ptarmigan, he will often lead a team of dogs a merry run if the driver does not stop them, or imagines they are on the scent of reindeer, as he often does. I always found the rabbits living in the crevices of the boulders, heaped over each other, the covering snow forming a little igloo, which, with their immense coat of hair, is sufficient to protect them in the coldest weather. I have seen them in all months of the year, and if they store up a winter's supply of food (which I do not believe), they are very busy in the winter maintaining it by accessions from their winter quarters. We saw a few little birds, and the jack rabbit of the American plains in quantity of meat he is his peer in size, if not larger in the winter, when he looks like a great bundle of white feathers. He is not eaten so much by the natives as by the wild animals, the foxes, wolves, and wolverines.

The Arctic fox is much smaller than the common variety we are used to seeing at home, and equally sagacious. I have seen several, but saw only one before he was secured, and one so far as to procure his pelt. He was either too far to reach with the scattering argument of a shotgun or too agile for a rifle in anybody's hands less active than those of Dr. Carver's. It is not often that the natives get one by shooting, but they manage to trap large quantities for their skins, which they trade to the Arctic walemen, although their meat is not rejected. The natives are very fond of the Arctic foxes, and have pronounced their meat worthy of the table, and probably it may be by comparison when long isolated from all sorts of fresh meat. The traps of the natives are simply slabs of ice with the common figure 4 spring, and when they visit the traps at rare intervals, the slab falls on the top of a small rectangular pen of ice, thus enclosing Reynard alive, as otherwise when crushed and broken to pieces the animal would have been dead to all uses and the fur pulls out. These ice-traps were often seen about Hudson's Bay. On King William's Land the Netschilliks built pens of the slabs of

"You must've killed a good many," said Jack.

"Well, yes; a good many, and more too. I couldn't 'zactly say just how many I've killed and skun, or how many teeth I've pulled; but there ain't a butcher who hev skun more bee-cattle or mutton-sheep than I've skun 'gators; and there ain't a tooth-carpenter in the Newwinted States who hev ex-ztracted more teeth from humans than I 'gators. I'll be doot-busted if there is!"

"I suppose that with the hides and teeth it is a pretty profitable business," said Squire.

"Well, I'm not sure I'm more than the profit. The hides and teeth buy grub and tobacco; that's bizness, bet your ribs! But the enjoyment of the fun is what makes life with livin' with me. You clean out the 'gators, and you clean out me; 'xterminate 'gators, and you 'tinguish Alligator

Ferguson. Without his open countenance and lively tail this vale of tears 'ad hev no attractions fer me!"

"Take it altogether then, hides, teeth and tun, and it pays you pretty well," said Squire.

"Bet your rifle 'd get half a dollar for the hide, five dollars a pound for the teeth, and a dollar and seventy-five cents in fun for every 'gator I kill!"

Jack, who was lying on his bunk, fished out from under it the skull of the big one he had shot at New River, and like Mr. Boflin in Mr. Venus's shop, "lying behind his smile," said:

"How is this for a specimen head, Mr. Ferguson?"

"Well that ain't half a dollar, but I've seen bigger ones, with bigger teeth, but I never saw one just like it on this coast; how long was he?"

"Twelve feet to an inch," answered Jack.

"I've killed a good many 'gators, but I never killed one over twelve feet. And 'gators is like humans, some has big heads, and some small heads; and 'tain't allus the biggest 'gator as has the biggest head, but generally the bigger the head the smaller the brain, just like humans, but I'm bound to say no 'gator's got much brain to brag on. I've caused a good many to die with water on the brain, but I'm bound to say none ever died of inflammation on the brain, cause they ain't got enough to inflame. There's another cur'us thing 'bout 'gators, the smaller the brain, the more musk they carries, just like humans!"

### BOYHOOD REMINISCENCES.

As we get along in years, portly and gouty, nearing the senile and yellow leaf, as it were, and can no longer climb the rough mountain-side for the whirling gourd, nor take long tramps behind the faithful dog for quail or snipe, but have to content ourselves behind the blinds for bay-birds or water-fowl, or ride to a runway and take things easy for a shot; how natural it is of an evening at home, reclining after perusing your domestic paper, to recall those days when we were wont to consider ourselves second to few in those sports where hardihood and perseverance were the *sine qua non* of success. From several articles recently in the *FOREST AND STREAM*, I see that others than "Jacobstam" are going back to years ago. That is a sure sign that they are growing old, and they cannot but hide it.

Boyhood and early manhood were great among the mead hills of Madison county, New York State, some thirty or more miles from Cooperstown and the beautiful Lake Otsego, a region made renowned by Cooper, the greatest delineator of woodcraft character the world ever produced. The original from whom the novelist took his Leatherstockings, was well known in our little village. When I was a boy he was an old man, and went only by the name of Old Hunter. He had lived for many years in a cabin in the woods, and hunted and fished for a living. For a few years before his death he lived in our village, age and rheumatism fast breaking the old man down. It was said that Old Hunter had a history; that he was a man of education and a lawyer of promise, but his domestic relations proving unfortunate, he had left his family, and with his dogs and gun had taken to the woods and had there lived for many years a hunter and trapper, rarely visiting the settlements until the deer and bear were gone and he had to come down to grouse and squirrel. But Old Hunter was a character, very taciturn, almost moody; and never, even when in his cups, would he tolerate any quizzing in regard to his earlier life. He was always hunting and fishing alone, and invariably successful. Let an intimation be given a day or two in advance that Judge Mason wanted a brace of grouse, a half-dozen squirrels, or some trout, and he never failed to fill the order.

It was an object of great veneration to us boys, and many were the pleadings to be allowed to go with him on some of his tramps, but of no avail. I had given the old man a promising pup, and he was well disposed toward me, but I never could get his consent to go with him; he always had some excuse—too far for us boys, we were too noisy, etc., until one day in the spring—drumming time for the partridge, we knew where the grouse were not close season in those days—I was out on a little hunt by myself, when I espied the old man slowly climbing the wooded hill. "Now is the time," thought I, "he has got to take me now." I insisted upon accompanying him. He didn't like it, I knew; said he "had got to get a couple partridges for Lawyer Mitchell," but that if I would "keep still and obey orders I might follow along." I followed along very quietly up that rugged hillside.

Finally we came to a thicket of undergrowth. Here the old man paused. "This," said he, "is a good place for a partridge. You go that way," pointing to the right, "and I'll go this. We'll come together on 'other side; perhaps we may start one out o' here."

I started around and had not gone more than half way when I heard the old man's gun. Upon his joining me, sure enough a grouse leaped at his belt. "You've got one, I see," "Yes," said the old fellow, "he was on a log and I shot him through the head." The marks of the bullet were there, clear through the eyes.

We trudged on a while longer, until in his judgment we came to another likely place, when the same arrangement was proposed: "You go around that way and I'll go this." Now about this time I began to suspect something, I hardly knew what. "All right," I said, and started off, but only a short distance, when I whipped back, dodging behind the trees, and followed the old fellow. He didn't go far; but looking around carefully and being apparently satisfied that there were no prying eyes on him, he parted the bushes and stepped in a short distance. I was close behind, holding my breath, when what did I see! A drumming log, hanging by a noose, a grouse. The old hunter took the bird from the noose, held it up, and then deliberately fired his gun off in the air. That was for me. I retreated a wiser boy for the future, and with some of that veneration gone. My idol was somewhat cracked, if not entirely broken.

I watched the old veteran after that, and I found his favorite trout resort away in a swamp where no one ever dreamed of fishing a trout at all, much less fish of a pound or more in weight.

All those were good old days. We boys didn't have much pocket money in those times; Baptist ministers' sons generally, I believe, don't have, and we sometime were hard put to our trumps to get the ammunition we wanted. My first gun was an old flintlock musket, with hard peas scooped surreptitiously from the farmers' hoppers. I wish I could find a red-letter day it was for me when my father, wishing to reward me for being an exceptional good boy, put into

my hand my first shotgun—a percussion cap, 14-gauge, single barrel. How the squirrels, crows and partridges (grouse) caught it for the next few seasons. But I outgrew that, and my longing was for a rifle that came in one time. All these indeed were halcyon days, roaming over old Madison county hills. There was not a spot that I did not know; and every butternut or hickory tree near a wood for miles around. How I watched for the cornfields near certain pieces of woods, and how angry we all used to get at the farmers when they cut down for the wood our favorite squirrel resorts.

And those "coon hunts" o' nights! What an immense amount of tramping and downright hard work we used to go through; and the snicker and wicked-looking through the ice; and the fox hunts. Of course we shot them—if we got a chance; we straddled no horse after them in that region. And the hares (big white ones) in the cedar swamp; and the chicken shoots, and afterward, when we had achieved our rifle, the turkey matches; and the trapping for muskrats and mink. How proud I was the day I caught my first mink! I brought me \$1.25; and what an immense ammunition that bought. Let me see, we used to pay—for powder 4 pound, 9 cents; shot, 2 pounds, 12 cents; caps, G. D., 10 for a cent, 30 cents. That was about the amount of our purchase at one time, except on Fourth of July, when we had saved up for the occasion.

I am becoming garrulous. But these are about the usual experiences of boys fond of sport, and it does my old heart good to go back to them.

JACOBSTAM.

### A FEW WORDS FOR THE WOODS.

EVERY sportsman should be a wood-lover and foe to the ruthless axe which is being swung with such indiscriminate zeal throughout the country.

Tree after tree falls to the ground, hilltops are made bare and unsightly objects, and ugly vistas are opened up by the destruction of forests.

To be sure there are voices raised and able pens wielded against this vandalism, but it is the duty of every man who carries the rod or the gun to be alive to the interests at stake and in every way possible to stay the hand of the wood-chopper.

Year by year has the writer mourned the loss of favorite trees in his walks and drives; every spring and every fall has he sought some sturdy elm or oak in his fishing or shooting excursions, and found in its place a hideous stump, and he expected shady half a beautiful, barren place, open to the garish day.

If the woods go, the game and the fish must also go, for the one must have cover in which to rear and to rest, and the other must have pure water, which depends upon the forests. Some men are so utterly pig-headed as to be blind to their own greed and interests, and such must be made to heed the laws of nature and to follow in her gentle, kindly ways.

It ought to be made illegal for a man to fell a shade tree without a "good and sufficient" reason, and that reason to be considered by an intelligent and authorized body of men who know the value (other than as merchantable cord wood) of trees. Every winter the felling of trees—the utter destruction of forests—goes on, and every summer follows a drought and dense heat, and the people point for ornithological birds, and the pleasure of the farmer, plant your barren, bleak hillsides with goodly trees, and increase your comfort, the beauty of the land, and, most assuredly, your revenues, by so doing.

O. W. R.

## Natural History.

### APPROACH OF SPRING AT ST. LOUIS.

JEFFERSON, WIS., Feb. 19, 1883.

The following letter from Mr. O. Widmann, of St. Louis, Mo., is too good for me to keep all to myself.—W. W. COOKE:

ST. LOUIS, Feb. 16, 1883.—We have had unusually cold and disagreeable weather since the first of January. Old Bonas was reigning and kept the ground white and the temperature below the freezing point for ornithological birds. The weather was cold and windy. February tried to make things better by a two days' rain, with the mercury below 30°. Of course it succeeded splendidly in making matters worse, and everything, from the smallest grass stalk to the largest tree, was covered with a heavy coat of glittering ice. Ornithology had to go on skates or stay at home. This miserable weather lasted a whole week, from the 5d to the 10th, but by the 14th a warm rain and a strong breeze from the south raised the thermometer to 62°.

This first warm breeze brought the first flock of ducks, and since that time thousands and thousands have passed north. Between 4 and 5 P. M. on the 15th twenty-eight large flocks passed, and at 5 P. M. twenty-two smaller flocks, passing slowly up in beautiful gradients; two small and two very large flocks of geese were also seen. Between 7 and 8 A. M. the 16th, I counted over fifty flocks of ducks, amounting to over two thousand individuals, going up the same way and at the same great height. To-night the mercury stands at 25° and all is white and hard again. Did these ducks know about this approaching great change in the weather and did not mind it, or contrary to the belief of some ornithologists, are unable to read probabilities?

Since this first south-wind period seems to mark a new era in our bird life, it will be well to close the chapter of mid-winter notes now and report what I have seen.

As the weather during the first six weeks of this year did not permit excursions to new fields, I contented myself with revisiting the ground gone over in December to see what had become of my little friends enumerated in my New Year's report.

Of the three mockingbirds mentioned there, two stood the weather bravely and are doing well, but the other has not been seen since the freezing rain of 2, 3. Bluebirds have also remained at their old places, and as a sign that they did not suffer even during the ice-coat spell, the first mid-day two males were already courting a female, with as fine a carol as ever heard in spring.

Fittines, chickadees, vireos and nuthatches are not disturbed by any kind of winter weather, as they can find food where few other birds would think of looking for it, and

tree holes afford unexcelled shelter. Nevertheless they all appreciate southerly winds, and become loquacious in their exultation over a big rise in temperature.

Most, but not all, of the yellow-rumped warblers have vanished. The purple Finch has become very numerous in large numbers, and during the "glacial period" in all places where the coral-berry or Indian currant grows. In those cold days, when everything, even their favorite sycamore buttons, was buried in a sheet of ice, they had to put up with this meager food. They worked hard all day to appease their hunger, but did not succeed. Hard, unrelaxing factory work it was for them, as they do not eat the whole tree, but merely the small seeds within, and even these they have to husk before eating. After the birds had worked there a few days, the ground was covered with the husks, skins and pulp. On six acres, overgrown with patches of this plant, I found about a hundred purple finches. About ten per cent. were in crimson, and the other in plain brown. When the weather moderated they left the coral-berry. The American goldfinch braved the cold of January, but the freezing process of February 3 was too much for them. They have almost wholly disappeared. A walk of nine miles in nine hours revealed only two birds.

White-throated, white-crowned, song, and tree sparrows and the black snowbirds remained the same at their winter quarters. Old Pippa has braved the cold well, his call comes from the same thicket as in December, and Mrs. Pippa is seen on a hundred yards off. The evening Grosbeak is a hardly fussy, but he likes warm days in winter better than cold ones. When the sun shone brightly on the 12th inst. he was much pleased with it and put in a lovely song.

The crow seems to degenerate! It cannot stand so much as it used to. I found them badly starved and frozen, with a terribly empty stomach, and the whole bird not more than one-half its usual weight.

Blue jays still know how to keep from starving, or else they manage to live on noise making.

The downy and hairy woodpeckers remain at their places, and are bound to make the first warm day, no matter how deep the mud is. Mr. Redhead tried his best to stay and live on ice-cold acorns and such like. I met him in cold days, but he did not seem to care. He was not so fat as he used to be, but he was with his brothers. The Flickers remained, and were doing well on the 12th inst., but they looked as if resolved not to stay with us next winter.

New species seen since last report:  
Pine goldfinch—One bird, 1, 18.  
Golden-crowned kinglet—Two pairs, 1, 6.  
Brown creeper—One bird, 1, 6.  
Red poll lined—One bird, 3, 7, and flock of 20-30, 5, 12. They were wholly unacquainted with such a thing as a shot-gun.

Lapland longspur—1, 6. A flock of thousands on a field grown over with a sedge, on the seeds of which they were feeding eagerly. It seemed that they had made a contract with the owner of the field to clear it of every seed in the shortest time. And how they went to work to put the seed to work, as they had to husk the minute seeds. They were not willing to leave their task undone, and a shot had no other effect than to make them go up in a cloud with a thundering noise, whirl a few seconds, and come down again near the same spot. They seemed to do the work systematically: every few minutes the rear part of the array flew over the heads of the others to the front, and all moved in the same direction.

Swamp sparrow—One bird, 1, 29, same place where I found one last winter.

Purple grackle—Four seen, 1, 19, and two on 1, 29.  
A few gulls (*L. argentatus*, *S. hiemalis*) remained here and were seen several times over the Mississippi at the south part of the city, where the strong current prevented the forming of ice.

### BREEDING OF THE RATTLESNAKE.

Editor Forest and Stream:

In your issue of Feb. 1 "E. S." writes of the habits of reptiles, gives some information from personal knowledge, and arrives at certain conclusions, in one of which I think he may be mistaken. He says that he "knew that the rattlesnake is propagated from the egg," but I have been taught to the contrary, and will relate a circumstance wherein for once, at least, there was no "inter-vention of eggs" to bring a lively lot of young rattlesnakes into the world.

I spent the summer of 1881 at a watering place in this State, where rattlesnakes are not unknown. At the hotel was a French cook named Joe, who had a fondness for snakes, particularly those which made a noise with their tails. Not a great way from the hotel was a "den," and one day Joe, accompanied by an old rattlesnake hunter named George explored the mass of broken rocks constituting the "den" and returned to the hotel with several live rattlesnakes; their fangs were drawn and they were placed in a box with a glass cover. Snakes are not exempt from accidents; one of the little snakes was killed and one was so hurt that Joe made other journeys to the den to keep up his stock, so that near the close of the month of August the snake box contained two large snakes, nearly four feet long each; one a black male without fangs, the other a yellow female with fangs. About the 1st of September the female was delivered of nine young snakes, each about eight inches long. Among others my husband and I were present at the birth of the young. The rattlesnake is a very curious animal. I saw the snake after she had brought five young into the world, and again directly after the last one was born, but I take my brother's statement as an eye-witness to the entire operation. Each young snake was enveloped in a sac, and as about one-half the sac became visible outside the vent it would burst, forcing the young out. As soon as born the little snakes rolled themselves in the sun to dry. Eight were born alive, one dead. After five were born, at intervals of only a few minutes, there was an intermission of nearly two hours, then the others followed. "When I saw the snakes hit of the sacs were in the bottom of the box. Did not 'E. S.' mistake the sacs in the snake that he killed for eggs?"

The Frenchman, Joe, took the snakes, old and young, to Albany, and a few months after his arrival there was bitten on the hand by the female snake, and his death followed in a few hours. This has nothing to do with the birth of the snakes, but much to do with their death, for the authorities ordered them killed.

A. N. CRENEY.

GLEN'S FALLS, N. Y., Feb. 17, 1883.

## THE BIRDS OF MAINE.

With Annotations of their Comparative Abundance,  
Dates of Migration, Breeding Habits, etc.

BY EVERETT SMITH

192. Bartramian Sandpiper.—*Tringa bartramica* Aud.; *Bartramia longicauda* Ridg. 553, Cs. 640.—Abundant. Arrives in April and early May. Breeds upon the ground in fields and pastures, lays large buff eggs with fine brown spots, sparingly distributed, late in May and early in June. The young birds are well grown in August. The Bartramian sandpipers are locally termed "highland plover" or "upland plover." During the latter part of August they commence to veer their way toward the south, moving in small flocks from the inland breeding places to the marshes and fields along the coast, and but few, if any, remain until the month of October. Their movements, as well as their cries during the season, are peculiar, and are to be witnessed at no other time of the year. Various evolutions are performed in the air, and cries are uttered which bear no resemblance whatever to the familiar notes heard later in the season.

Sometimes rising so high in the air as to become nearly invisible, the bird will repeat these cries, circle about, swoop with set wings somewhat in the manner of a night hawk, etc. It is difficult to tell the cry usually uttered at such times. A quick repetition of short, shrill whistles, resembling those of the fish hawk, is followed by a diminishing decrescendo terminal note much prolonged. But few of our wading birds are so highly esteemed for food as are these sandpipers, which may well rank with the woodcock and snipe in this respect. Leaving Maine in very fat condition during the month of September, they migrate to regions beyond the southernmost limits of the United States. When returning, they arrive upon the Southern shores in such lean condition and gray plumage that their general appearance is greatly changed from that of the summer.

193. Buff-breasted Sandpiper.—*Tringa fuscescens* Aud.; *Tringoides fuscescens* Ridg. 556, Cs. 641.—Rare. Although a little larger than the sandpipers, most commonly known as "peeps," yet this bird is so small as to be given little rank as game, and therefore it is probable that but few of those shot ever appear in the markets or are reported to ornithologists. These sandpipers are nowhere represented by large numbers, and in Maine it is the rarest of the sandpipers known here, having the following record of specimens shot at Scarborough, Maine: Two in 1850 by Caleb G. Loring, Jr.; two in 1864 (one by the writer, August 31, and the other September 3); one August 21, 1866, by the writer. My friend Nathan Clifford Brown has given the following additional record: One "shot out of a flock of golden plover," September 15, 1875; also one shot by Mr. J. H. Bond in September, 1875; one shot by Mr. Henry Fletcher, August 1, 1877, and one shot by Mr. Brown himself, September 1, 1877; one shot by Charles E. Southery, Esq., September 1, 1882.

194. Sanderling.—*Tringa arenaria* Aud.; *Calidris arenaria* Ridg. 542, Cs. 627.—Abundant along the coast during autumn migrations, August and September. Locally known as "beach bird." Associating in flocks upon the sand beaches. The birds of this species may be distinguished from the "peeps" by their more generalized plumage appearance of plumage (in autumn), and upon examination the lack of a hind toe. The latter feature is peculiar to no other species of our sandpipers. The spring migration of the sanderlings past the coast of Maine is made far out at sea. The sole instance of their occurrence on the shores of Maine in a spring that I have learned of was at Scarborough, May 30, 1882. A flock of eight was seen and five of them were shot.

195. Ring-billed Gull.—*Larus delawarensis* Gmel.; *Macrotis hypoleucos* Ridg. 554, Cs. 639.—Accidental visitant from Europe or Great Britain. Ruff is the name applied to the male species, and reeve to the female. I shot a reeve at Scarborough, Maine, April 10, 1870. The bird was alone, flying swiftly near the water, down the course of the Non-such River, and uttered no cry. Although about to shoot some ducks as this bird passed me, I sacrificed my opportunity to procure a specimen, and the specimen was shot at one of the lakes in Upton, Maine, September 8, 1874. Mr. Boardman has reported the capture of a specimen at the Bay of Fundy and several other specimens have been killed in New England at various times and the facts publicly reported.

196. Spotted Sandpiper or Tattler.—*Totanus maculatus* Aud.; *Tringoides maculatus* Ridg. 557, Cs. 638.—Abundant. Arrives in early May. Breeds. Nests upon the ground late in May, and in June, and lays four buff eggs blotched and spotted all over with dark brown. The nest of grass is usually made. The downy young are light drab upon the upper parts, with a brownish black median line from base of bill to tail. Straight black line each side of head, from nostril to root of head, interrupted by eye. Lower parts white. Feet flesh color. The "tattlers" are generally distributed throughout Maine, about the inland streams and lakes as well as along the coast.

197. Solitary Sandpiper.—*Tattler*.—*Totanus solitarius* Aud.; *Rhyacophilus solitarius* Ridg. 550, Cs. 639.—Common. Arrives in May. Frequently muddy districts, wet barnyards, etc., and is sometimes known locally as "barnyard plover." Some birds of this species remain in Maine throughout the summer, and probably breed here, although the discovery of their nests and eggs here has not been reported as yet.

198. Great Yellow-shanks Tattler.—*Yellowlegs*.—*Totanus flavipes* Aud.; *Tattler*, 519, Cs. 634.—Abundant during summer and autumn upon the marshes along the coast. Locally termed "summer yellowlegs." Very rarely seen in Maine in the spring, and the following record comprises all the notes I have of its occurrence here at that season or before July. (Doubtless the June specimens were unusually early return arrivals from the north. This species and the red-breasted snipe were observed at Scarborough, Me., July 5, 1868.) One, May 18, 1859; one, May 20, 1859; one, May 21, 1859; one, May 17, one May 25; one April 23, 1859; one May 12, 1862; one June 24, 1863; one April 30, 1864; one June 28, 1877.

I once procured a specimen with the plumage of the breeding season upon the second day of July, at an island in the Bay of Fundy, and saw another one, apparently its mate, at the same locality.

Usually but few "yellowlegs" of this species arrive here in the fall, and they are not abundant in the marshes, and during July, but throughout the month of August, and the earlier part of September they are generally abundant about the marshes. For extremely late autumn dates of its occurrence here the following are notable: One October 7, 1858; three October 11, 1858; one October 21, 1858; one October 10, 1864; one October 14, 1881.

199. Great Yellow-shanks Tattler.—*Yellowlegs*.—*Totanus*

*flavipes* Aud.; *Totanus melanoleucus* Ridg. 548, Cs. 633.—Locally termed "winter yellowlegs." Abundant during spring and autumn migrations, especially on the marshes along the coast. Arrives early in April, and the spring migration extends throughout this month and May. The autumn migration occurs during August, September, and October. The latest date I have record of its occurrence is that of two specimens shot at Scarborough, November 5, 1861.

200. Semipalmated Tattler.—*Totanus semipalmatus* Aud.; *Semipalmatus semipalmatus* Ridg. 552, Cs. 632.—Not very common. Summer visitant. I have the record of but a single instance of the occurrence of this species here in spring, a bird found at Scarborough, May 21, 1866. It is of not uncommon occurrence in summer and autumn, but apparently rather an irregular visitant, and the species is never abundant here.

201. Great Marshled Godwit.—*Limosa fedoa* Aud.; *Limosa fedoa* Ridg. 543, Cs. 628.—Rare; occasional visitant from the South. The following record is from notes of the occurrence of the species at Scarborough, Maine: Two in 1857, one in 1855, one in 1857, ten in 1862 (two shot Aug. 20, three Aug. 21, five Aug. 26), two in 1863 (one shot Aug. 13, one Aug. 25), one April 20, 1865. The latter is the sole record I have of the occurrence of the species here in spring.

202. Hudsonian Godwit.—*Limosa hudsonica* Aud.; *Limosa hudsonica* Ridg. 545, Cs. 629.—Not uncommon at the Scarborough marshes during the autumn migrations, but never abundant. Not seen in spring. Sometimes locally termed "brant bird" and also "spot rump," on account of the conspicuous white mark across base of tail.

203. Long-billed Curlew.—*Numenius longirostris* Aud.; *Ridg.* 558, Cs. 613.—Occasional visitant in summer. Uncommon. My only record of its occurrence here in spring is that of a single specimen shot at Scarborough, May 2, 1866.

204. Hudsonian Curlew.—*Jack Curlew*.—*Numenius hudsonicus* Aud.; *Ridg.* 559, Cs. 615.—Common during spring and autumn migrations. Arrives in May. Never abundant here.

205. Esquimaux Curlew.—*"Dough bird"*.—*Numenius borealis* Aud.; *Ridg.* 560, Cs. 616.—Common during spring and autumn migrations. Irregularly abundant. Great numbers of curlews migrate along the coast of Maine for at sea, and only appear here upon the land when heavy weather causes them to pause in their flight and come to the shore.

[TO BE CONTINUED.]

THE PHOEBE'S NIGHT SONG.—*Editor Forest and Stream*:—Ancient your "Visions of the Night," does anyone doubt the dreaming capacity of birds and animals? In the case of the phoebe bird it is very evident to me that such is the fact. Take a night in August or September and fancy yourself with mistletoe to Nature's voice, after the world is asleep. Scarcely a breath stirs the treetops and the full rich moonlight glimmers on the dense foliage, casting the clearly cut shadows of trunk and branch on the grassy carpet below. The air vibrates to the song of myriads of katydids, while the drone drone drone of the crickets, finding a monotonous and soothing accompaniment comes to us in regular pulsations from the woods. Then it is that you may hear the phoebe's voice ring out from the dark aisles among the trees clear and sweet (though plaintive) above the insect chorus, as though the little fellow slumbered uneasily.—DICK.

OHIO BIRD ARRIVALS.—East Randolph, O., Feb. 16, 1883.—Saw two killdeer plover flying north. This is the earliest record of its arrival in this vicinity I ever heard of. Weather warm, thermometer 65°. Bluebirds, robins, and crows are here. Crows have been here all winter, and also the song sparrow, which is now in full song. It may not be out of place here to give dates of earliest arrivals of bluebird during the past five successive years: Feb. 22, 1878; March 5, 1879; Feb. 17, 1880; Feb. 22, 1881; Feb. 13, 1882; Feb. 16, 1883.—A. HALL.

## Game Bag and Gun.

To insure prompt attention, communications should be addressed to the Forest and Stream Publishing Co., and not to individuals, in order that the latter may be free to devote their entire time to the publication of the paper.

## A HOLIDAY CRUISE TO MAINE.

HAVE you ever forgotten your first deer hunt? How every article in the outfit was examined, criticized and talked over again and again, and that rifle was in such prime condition that its various parts seemed to be out on dress parade, and had inhaled so much of your excitement that you could actually feel a tremor running through its fine fiber, and how—but, of course, your memory has played you no such rank, and the recollection is, undoubtedly, as fresh as the present time, as it was on that memorable day, when you, while telling the boys that you had brought the quarry to camp, vainly tried, under an assumed air of unconcern, to hide that pardonable and natural pride of the heart which we both know.

For I have recently experienced my first deer hunt. In company with two congenial spirits and fellow students, Fred Todd, of Milltown, N. B., and Harmon J. Coulter, of Georgetown, Col., I hurried away from the classic halls of the Phillips, in a house or wagon, and spent the last of the Christmas vacation and took train for Todd's home.

We left Boston at 9 A. M., Dec. 22, 1882, and after a delightful ride reached Bangor, Me., at 8 P. M. At the latter place we transferred ourselves and belongings to a sleeper, and made all preparations for a cozy change at McAdams Junction, N. B., to the night train for St. Stephens, and then turned in, but not to peaceful slumber, for scarcely had we sunk into the arms of Morpheus, when even the faint opportunity had been given us to launch off into sweet dreams of deer, and deer hunts, in which every tree had the wonderful faculty of turning into one of these beautiful creatures, when we were roused by a Custom House officer, while "crossing the line," who went through us, and came mighty near nipping Todd's trip in its infancy, by walking off with all his rifle shells. It was only after the most strenuous and arduous efforts and one united persuasive powers that we three night-lighted and excited youths bore back the shells in triumph.

Upon reaching McAdams Junction, at about 2 A. M., the bracing news greeted us that the night train had been taken off, compelling us to make this our headquarters for the time being; so rousing the inmates of the Junction House,

we secured rooms and finished our interrupted sleep. Making a cautious survey in the morning we found that we were anchored in the midst of about a dozen houses and an ocean of bare, blackened stumps (the result of one of those destructive fires that so often sweep over these wooded countries). "Not much excitement to be found here," thought we; so setting back with the latest Forest and Stream, we gave ourselves over to its pages. But mine host, Capt. Herbert, proved himself a jolly good fellow, and entertained us with not a few stories of bear and deer hunting, and reminded the deer were plenty in the adjoining territory, so that the time passed away very pleasantly until the train gave in sight. To Harlow and myself this "down East" trip was an entirely new experience, and it was with a deal of pleasure that we took note of the country, the people, and their dress.

Have you, reader, ever been down this way? If so you will recall the many fine specimens of manhood that appeared at every station as you hurried toward the wilderness. After leaving Bangor the great interests of the people are centered in their forests, and fully nine tenths of the inhabitants in the immediate vicinity of the great water ways are interested, in some way or other, in the lumber trade. This of course necessitates a vast deal of outdoor life; the result of this active exercise is plainly seen in the natives. They had long since donned their winter garb, and with the body snugly encompassed in numerous shirts and thick homespun, and with feet inclosed in their fancifully colored stockings and lavishing many of the costumes were simply picturesque. At about 8 P. M. of the same day we sped away to St. Stephens, a city which with two others (Calais and Milltown, constitute what is known as the Union.

These places, distributed on the east and west banks of the St. Croix, are connected by three bridges, and with each recurring spring are the scene of bustling activity; the many thousand feet of lumber piled among the headquarters and branches of the St. Croix are rolled down, and here meet their arch enemy, the ever ready saw.

It is needless to say that at Milltown, at the residence of Mr. Charles F. Todd, a most hearty welcome awaited us, for any one who has had the good fortune to tarry with him has always carried away the most pleasant memories. We remained at Mr. Todd's until the 26th; in the meantime all the necessary paraphernalia had been collected, and it was with no little desire that we came to the city, and, standing away snow shoes, axes, guns, etc., into one of those comfortable and tough little sleighs, known as pungs (in which the Brunswickians dart about, we arrayed in the prevailing mode of the country—heavy caps and mittens, each with six pairs of woolen stockings under our moccasins, deposited ourselves in the interiors of the baggage and started for Princeton, Me., twenty miles away, where we met our guide, Mitchell Sewey, by name, a tall muscular looking fellow of the Passamaquoddy tribe. He proved himself thoroughly acquainted with the country and with the most likely places for game, at the same time an intelligent, hard working fellow. I feel no hesitation in recommending him to any one that may visit the region.

Leaving Princeton at about 11 A. M., we drove rapidly across Lewey's and Big lakes to Grand Lake-Stream, twelve miles distant. Here is located one of the State hatcheries. We were not able to inspect very thoroughly, but found everything in excellent working order, and were gratified to hear of the good results of their work. May it keep on.

From Grand Lake-Stream, under the direction of the guide, we struck off on a bark road for a logging camp, fourteen miles off, known to be in the center of a great deer country. Oh! the horrors of that bark road, the worst corduroy in the country could not equal it. After unsuccessfully trying to drag our punge across the punge acrossed, with the exception of the one driving, got out and walked. The sleigh was first up, and then down, with a soul-stirring plunge, then a violent lurch to one side of the road, and after extricating the punge from the bushes, only to go ahead a few steps and strike an unexpected root, a snap and spring of the punge, and a general movement of the baggage was the inevitable result, and so it was repeated until, when still far from our doubtful destination, night had closed in upon us, and the punge, after the night in these woods with the thermometer loading around the zero point, seemed to gain ground as we went on; for roads crossed and branched off from the one we were on in the most perplexing confusion. The thought was not at all inspiring, for we were more than tired after our hard day's travel, and our horse was nearly tuckered. We wrote more in sympathy with this faithful animal than with ourselves, and feared the consequences of the night bivouac for its sake.

The guide kept far ahead, and with the aid of a torch explored most of the roads; so keeping up a steady trudging and following his directions, at about 8 P. M. the most welcome sight of smoke from a logging camp met our eager gaze; with a "view Hello" we lost no time in ensconcing ourselves within its spacious walls.

The hospitality of the woodmen are proverbial; rough and uncouth as they are they always share with you a generous portion of their food. Their welcome appeared directly to the heart, said member generally being reached through the stomach.

The cook bustled around and soon had a piping hot supper of beans, camp bread, and tea sweetened with molasses. No matter what time a man may strike one of these camps, the first question plumped at him is: "Well, stranger, had nothing to eat?" Other cooks seem to be of minor importance in a house or a wagon, but in a logging camp the prospects for game, and in making all preparations for the morrow's early start. The choppers had seen deer quite often while going to and from work, though many doubts were expressed as to our chances for capturing one, the snow being hardly deep enough for snow-shoeing, but making very uncomfortable walking; it would be necessary to exercise the utmost skill in still-hunting, and meet the animal on its own terms. The cook, however, was of the opinion that the deer would be in the bunk (better known as the man's pasture) with the men.

There were ten men in the gang all told, under the leadership of Joshua Crockett, of whom I shall write hereafter. This bunk occupied the larger portion of one side of the camp, and had a thick mattress of spruce and hemlock boughs. No time is lost in disrobing in the woods, the refinements of civilization are left behind, the men, after a moment's undressing, dislodging of themselves from four or five pairs of stockings, completes the necessary toilet. Securely wrapping yourself in a blanket, you soon, on those aromatic boughs, sleep the sleep of the blessed.

I stayed up a while longer and buried my cranium in Hallock's "Sportsman's Gazetteer," in order to glean addi-

Clericus I think, took up their abode within a short distance of the famous old grounds.

They probably had "shooting without sacrifice" to the full extent, for Clericus when he does get the trigger fever, is the most ferocious of sportsmen. "I could take a life unfold," he says. "Clericus" speaks for the entire body of professional men? I had supposed this matter of summer shooting was agitated for the benefit of market gunners and their wealthy patrons, with perhaps a crazy trigger-puller now and then. Here at the top of Connecticut we know how it works, and out of forty or fifty sportsmen in this little borough, I doubt that one vote could be had for summer shooting. To be sure most of us are workmen, but, speaking from observation again, the moral process is as active and wearing in many of our mechanics as it is in our scholars, "brain-workers." They also find rest refreshing, nature beautiful, and sport delightful. Sometimes, at rare intervals, a white day dawns for them, so with dog and gun they start for field and cover, too often to find the pleasure all in anticipation; the summer shooting of years ago and the "brain-worker" "kulting up the ravelled sleeve of care" leaving but a small margin on which to realize.

As to whole matter, I think the "brain-workers" are entitled to special privileges over the rest of us.

They seem to have a pretty good time of it, generally speaking, and what they cannot help themselves to is hardly worth having.

I might, perhaps, be willing to make an exception in favor of "Clericus" himself. For after a tremendous contest with the powers of darkness, what could be nearer a perfect rest than a wrestle with a July woodcock? OTHERCUS, CONNEXICUT.

## LARGE GAME AND SMALL SHOT.

I HAVE been reading in the FOREST AND STREAM week after week "Deer and Small Shot," and the wonderful exploits accomplished with these tiny specks of lead by the "craft" at sundry times and divers places, especially Dr. Sterling's experiences as recorded in your issue of Feb. 15, which reminds me of similar achievements in the "long ago" of my own hunting life.

I stopped crossing from that is called "West Arm" of Mollychuckunk Lake to Cranberry Bog, in the month of June. The path or blazed line passed over a high hill of second growth woods, and when about half way over this ridge, as I stepped up on to a large flat ledge of rock over which the path led, a middling-sized bear stepped upon the other end, some three feet up, and each of us was greatly surprised, as you may suppose.

I stopped and he came up to me, and the bear stopped when he saw me; and we each of us stood still a moment to catch a thought of what was the next best to do. We were about three rods apart, and we both wished we were further, for I had only a partridge charge in my gun; and the bear soon showed signs of uneasiness, for after eyeing me a moment he turned his head half way around and limbered up his forward legs in the act of getting down; he had been standing on his hind legs all this time.

On the impulse of the moment I raised my gun and fired at his ear. The bear dropped; the No. 6 shot had penetrated his brain, and I stood over him with my watch to see how long he would live, being prepared to give him another shot should it be necessary. He died in thirty minutes. The bear had been drinking at a spring which boiled up at the other end of the ledge.

I was following up a streak of air bubbles on the pond in my skiff, one morning before sunrise, to get sight if possible of the animal that made them, when all at once up came two large otters within easy range. I dropped the paddle and caught up my gun and fired the right, which was loaded with double B. The otter kicked over on his side and floundered about, but before I could get to him he sank in deep water and never came up again. But very soon his mate came up and crawled out on the floating log near by, and I let go the left, which had No. 6, and he rolled off the log, kicking up the water fearfully. I paddled up to him this time and took him into the boat before the wind was out of him; and I believe this is the only sure way, for I think they invariably sink when dead, as their bodies are very much heavier than those of land animals of the same bulk. J. G. R.

REVENUE, MAINE.

Last fall, while spending my usual annual vacation at my charming camp home on Indian River, in the northern portion of the Lower Peninsula of Michigan, on the great interior thoroughfare between Petoskey and Cheboygan, one great bird of prey came to try my hand at the deer, which abounded in that river. Lying close in the end of my little sneakboat, waiting for opportunities to bag my game whenever they presented themselves, we glided noiselessly around a sharp bend in the river, when we heard the frequent splashes of water, such as would come from a large animal wading through the sedge and bulrushes that grow all through the overgrown marshes. On it came with great distinctness as it approached, and being perfectly satisfied now that it was a deer, I ordered my man to remain quiet, and with muffled oars turn the boat to the river's bank where the wind and tide were carrying her. The splashes came nearer and nearer. Our boat lay close to the north bank, just opposite the point of a long, dense clump of sedge and bulrushes. I quietly rose from my seat, and holding my gun close to my shoulder, with bated breath I waited for the moment more I saw a deer's head appearing at the point of sedge just in front of me, his ears thrown forward and his eyes glancing at me. It was a slight—a pull and an explosion. I heard a plunge, and it was silent. We hastened to approach the spot where I last saw the deer, and clearing away the driftwood which lined the river's edge, we pushed and pulled our boat over half-sunken logs and through the weeds, but could hear or see nothing. On we went, and then a sudden splash of the floating carcass of a doe came into view. The otter was about eighteen inches deep, and we nudged away on our secured game and after a little effort succeeded in getting it snugly fixed in my little duck-boat, only twelve feet long by three feet beam. We then pulled out from the marsh into the river, and by dint of rowing and paddling reached my camp home a little after dark. Now, summoning my man to get a light, and among whom was my friend, P. Morrison, of Jackson, Mich., who is an ardent hunter of deer, we succeeded in dragging our prize to my ice-house, a few yards distant. All around the country congratulations were given me for securing the first deer of the season. Those unacquainted with the facts in the case I found it quite difficult to convince that I killed that deer with No. 4

duck shot. Subsequently I measured the distance, and it was about 60 feet. I was astonished at the success attending the shooting. But the fact remains nevertheless true, and I must be entered upon the list of those who have bagged their deer with small shot. SENEX, ANN ARBOR, MICH.

## THE FREEDMAN AND THE QUAIL.

Editor Forest and Stream:

It would be much more satisfactory to your readers to have the opinions of correspondents on this interesting subject who have not yet delivered themselves, than its prolonged discussion by those who have already spoken. Permit me, however, to add a few words more, not for the purpose of maintaining any pet theory in regard to the matter, however contrary that theory may be to truth and justice, but in order to invite the further expression of opinion on the part of persons rendered capable by experience and observation to testify in this behalf.

We all understand "Rallywood's" position. He ascribes the scarcity of "Bob White" to the poor freedman. I do not know "Rallywood," and therefore have no means of judging whether his opinions are worth anything on this subject; but of the four correspondents whose articles with reference thereto have appeared in print, two I know are entitled to the highest consideration. One of these, "Chasseur," agrees with "Rallywood." "Chasseur" is well known in this State as a gentleman of exceptional high character, ability and culture, whose opinions are entitled to respect at least.

Upon the other hand, Dr. M. G. Ellzey, a gentleman also well and favorably known and identified with the best material interests of the State, than whom few have better opportunities of forming a correct opinion upon the question under discussion, agrees with me that the freedman is not responsible for the decrease of quail, and that he has, as a rule, abandoned the inclination to hunt, which was formerly such a prominent feature of his life. This is beyond cavil or dispute true as to the portion of the State with which I am familiar; and it is a singular fact that it is the opinion of every farmer with whom I have conversed on the subject. As was stated in a former communication, there seems to be as yet no accepted theory as to the cause of the decrease of quail within the last few years. "Rallywood" is perfectly correct in his statements of fact going to support Dr. Ellzey's theory, the conditions mentioned by the latter do not exist in the localities indicated by "Rallywood." The facts already alleged, showing that our colored friends are not to be held responsible for this mysterious disappearance of quail, taken in connection with other circumstances, and bearing in mind that quail are scarcest in the northern counties, where there are fewer negroes than in any other part of the State, should induce us to seek for some other and more satisfactory solution. In the extreme northern counties of Fairfax, Loudon, Prince William and Rappahannock, there is a population of whites, 59,487, and of blacks, 18,468. Here the quail are scarce. In the south side counties of Brunswick, Southampton, Greensville and Mecklenburg, where the birds are abundant and there has been no decrease, there is a population of 24,448 whites and 43,288 blacks.

In discussing this subject with an intelligent and highly educated country physician, residing in one of the northern counties, who is an observing sportsman, the idea was advanced that the quail had migrated from the northern to the tidewater and southern counties and to North Carolina, where quail are in great abundance. He stated, as a circumstance inducing this belief, that in the early part of the season there were very few birds on his place, but one evening in November, in company with a friend, he was hunting on a stream passing through his farm, and in the course of a few hours flushed fourteen distinct coveys. A few days afterward they hunted the same ground, but started no birds, nor have any been since found in the vicinity. On another occasion he, with a friend, flushed a covey with a white bird among the number. They endeavored to kill this specimen, as they had never before seen a white quail, but did not succeed. On the following day his friend returned home a distance of ten miles southward, and when nearing home his dog pointed. Upon being flushed the same covey with the white individual got up, and the white bird was killed. No one in the neighborhood ever saw a white quail before or since, and it was evident that the covey had within twenty-four hours gone a distance of ten miles. If quail migrate, that fact would account more satisfactorily for their scarcity in Northern Virginia than any other hypothesis which has been suggested.

It is to be hoped that the invitation extended by you to your correspondents in this State and elsewhere in the South, to give their opinions upon the interesting question of the abatement of the freedman's hunting proclivities, will receive fitting response. We would like to hear from "Wells" on this question. No one is better qualified to speak, instead of vexing his mind and cross-examining "Knick" with reference to that remarkable case in Florida, let us have the benefit of his views on the quail. If I mistake not, his tell-tale nom de plume, and irresistible propensity to pun, points him out as a recent representative in Congress from the "Old North State," and he has doubtless had abundant opportunities in his electioneering experiences with the "American citizen of African descent" to enable him to speak authoritatively. Although his repudiation to "Knick" exhibited rather too great intolerance of the license which "Knick" should enjoy in common with other sportsmen to "swap lies," especially when "Knick's" statement was to be supported by the affidavit of "V. J. S.," yet his reply was extremely witty and enjoyable. It would be instructive for him to tell us whether his experience bears out the assertion of "Rallywood" as to the skill of the freedman as a diplomat. M.

NORTHIDE, VA.

Editor Forest and Stream:

In a recent issue you ask for information as to whether the Southern colored brother is as destructive of game as he is used to be. My candid opinion is that while he is still entitled to high rank as a game destroyer, he is not quite as bad as he used to be. When they were "turned loose," as they generally express it, they became at once a race of sportsmen. Every man and boy was eager to be the owner of a gun. As the old negro sportsmen of the North were very chary in those days, they had not much difficulty in supplying their wants. Thus equipped they made a rush for the fields and woods, and for a long time, summer and winter, there was a perpetual fusillade. They slaughtered indiscriminately, shooting everything above the bluebird in size. Even

the mocking bird, for all his songs, was not safe. The sweet singer fell in the midst of his singing.

It had this sporting craze continued to this day, the South must have been completely bare of game. But it gradually wore off, for various reasons—first among which, no doubt, was that the new-fledged sportsman found that such business would not keep him and his family in food and clothing. The fact, too, that shot and powder and percussion caps could not well be had without some money, and that money could not well be had without some work, may have acted as a gradual extinguisher to the new enthusiasm. At all events, that the colored man has cooled off immensely as a sportsman, compared with what he was when the country was first flooded with freedom and old muskets, cannot be denied by anyone, at least in these parts. I can only speak for Texas on this matter. My judgment is that there is not one bird killed now by the freedman where they were ten killed by him in the early days of his freedom.

I have often meditated over the sudden conversion of the colored race into sportsmen, which we witnessed at the close of the civil war. What was it due to? Perhaps to their wild ancestral instinct, which, suppressed so long in slavery, broke out beyond all reason when their freedom gave the negroes in America no doing what they pleased, ever but hunt and grow gourd. To hunt, therefore, and to grow gourds, must be their peculiar race instinct, which will crop out on every favorable opportunity. We saw the great hunting mania, and every Southern man knows that you will rarely see a negro's cabin in the South without gourds growing around it. It may be, also, that they looked upon the possession of firearms and gunning as the highest privileges of freedom, and that, when they were eager to enjoy them as such; in other words, that the best way to show "big lujun bling" was to roam about with an old musket in hand, blazing away at everything that came in sight. How often have I met these ebony sportsmen in their rounds, and how keen was their enjoyment of the fun! Usually there was a flock of them together, and then there was an eager rivalry as to which would bag the most game. I have seen the negroes and their families, the women, the children, and the old men, all gathered around the gun, and how they would sometimes turn up the white of his eyes at the intruder with the white skin! I have seen them on such occasions puff up like a turkey-cock in all his glory. But they have got over all that foolishness now. When we meet them now with their guns they are polite and pleasant as possible. So, at least, I find them.

According to my best thinking the colored brother is much more destructive to game now with his traps and blinds than with his guns. These implements don't need to be fed with ammunition, which costs money, and they do their work while the freedman is also at his work in the cotton or cornfield. Bob White is the principal sufferer by these implements, and I believe his destiny is to be destroyed by the negro. They take entire flocks at a time, and they never set any of the captured birds free for sale. In this respect their character is entirely imprudent, or want of regard for the future. The birds for the most part are taken alive to the neighboring towns and villages, where they sell them at what they consider a big price. Hence they make a regular business of destroying Bob White. Their most destructive implement is a mere pen built of sticks and covered with brush. They have four trenches leading into the pen from opposite directions, coming to the surface about its center. These trenches lead into the pen and are partly covered with bark and sticks, except at the center, where they all come together. Cows or pigs are scattered thickly in the pen and also in the trenches. When a flock of quail comes along, they find the food in the trenches, eagerly follow it up, and, with rare exceptions, every one of them goes into the pen, and is there a prisoner. He never thinks of looking down for the hole he came in at; he looks upward all the time and sees the trap set for him. The freedman comes along and transfers the poor birds from the pen to his cage—from one prison to another. This whole regions are swept of their quail in Texas, and I presume it is so in other Southern States. It would be very difficult to suppress this business by legislation. If the birds could not be offered for sale without the risk of confiscation and fine, the freedman would still take them for the benefit of his own family, and eat the food at his own expense. The only way to stop him is to educate him into the conviction that he is behaving badly, and this, I fear, can never be done as long as Bob White exists.

We have many negroes who follow gunning as a means of livelihood in ducking season. Their manner of ducking is peculiar and characteristic. They do not walk, walk, walk and shoot like us white folks, counting home at night bespattered all over with mud and quite worn out. On the contrary the colored ducker returns at night with his dainty feet and clothes unsullied, and quite as fresh as when he started out in the morning. Moreover, he returns with just as many ducks as the white man, and even more if the latter be not a very good hunter. The way he does it is this: he finds a good place for ducks; to that place he repairs early in the morning, and on that spot he stays all day long. He gets himself well concealed and quite worn out. On the contrary the ducks. When they come he will remain motionless and noiseless for hours, if need be, until he gets a perfectly satisfactory opportunity for a raking and destructive shot. He takes no risks of losing a shot, and therefore never fires till it is a dead sure thing. Although his weapon may be an old musket, or an old rickety double-barrel muzzle-loader, he often kills many birds at a fire, and indeed generally does. Having fired, he quits his concealment only long enough to pick up the dead birds, which, being accomplished, he again returns to his cover and waits for another supply of ducks, which are quite sure to come along after a while. In this way they often make large bags in a day. They probably derived this way of doing from the cranes which they see along the rivers and about the ponds. Mr. Crane finds a good place to catch fish or frogs; he takes his stand there on one leg, and goes to sleep with one eye. He stays there all day long, unless disturbed, and sails away at night with his stomach full.

I was recently duck hunting on the upper parts of the Sabine River. I heard guns firing, evidently from along the river banks, during the whole day, and yet, though constantly walking, I could see no hunters. The ducks also

were constantly on the wing, flying from place to place. All this caused my special wonder. Suddenly a gun fired very near me, and going hastily in the direction it came from, I found an aged colored man busily fishing his ducks out of the water with a long pole. He explained to me that the shooting I had heard all day was from negroes along the banks of the river, who were so well concealed that I had not seen them, though no doubt sometimes passing within a few feet of them. He showed me his own hiding place, and it was so good I might have passed him hundreds of times without suspecting anybody's presence. After much duck fishing, I am going home. He is plentiful, as they are on Sabal River, that this is good a plan of hunting them as any that can be invented.

We had Mr. Chas. Hallock with us in Texas some two months this winter. He did me the honor to call to see me, but an sorry it was impossible for me to be with him much on his trip. Hope to see him with us again next winter, and that I may then have a better chance to see him through.

N. A. T.

PALESTINE, TEXAS, Feb. 22.

#### PENNSYLVANIA NOTES.

**ALTHOUGH** great quantities of snow have fallen during this winter, I do not believe that the game of this locality has suffered much. Ruffed grouse are careless alike of snow and cold, and if sly rhyard would only leave them alone I have no doubt next fall's crop of birds would be good; but foxes are very plenty, and foxes get hungry, and then grouse must die to satisfy their insatiable maw. The Gardner boys, living about a mile from town, have killed ten gray foxes this winter, and but for the fact of some unkind accidental shooting and wounding their leg hound, would have killed as many more. I rather think the person who shot Trusky would not have indulged often in this sport had he not been able to distance Joe Gardner in a walking contest immediately after the shooting.

Speaking of ruffed grouse reminds me that every year their numbers are diminishing. Now, don't say that subject is worn out, for a discussion that deals with the king of American game birds can never wear out. I do not believe that it is on account of improvements in guns or dogs, or in "treed" their numbers, but on account of the tribute it to the advance of civilization and "clearings," but I believe with some former contributor on this subject that their numbers are decreased by some disease which may be new to their species, or more malignant in late years than formerly. Last spring I found quite a number of their nests and know that quite a large per cent. of the eggs were hatched, and I saw numerous broods of them yet in the down shortly afterward. It is a well known fact that grouse do not travel much from their original home, and when the shooting season opened I went direct to the localities where I had seen the young broods, and much to my discomfiture found none, actually none. I know that they were not all shot, even if the pot-hunters did kill some of them. I hunted my dogs in the same locality several times during the fall, but found none. I do not believe that any new disease has killed the grouse family, but I could have that destroyed them, but it is my firm conviction that disease of some description exterminated them.

Wild turkeys were quite plenty last season and numbers of them were shot, but enough were left for breeding purposes. I was told by a stranger the other day that they were wintering well. Although there was a crust on the snow, he said he had had their own localities. I was told about this winter, and these droppings on the crust made capital food for the turkeys. Deer were more numerous than for years before, and scores of them were captured. Woodcocks were scarce; I suppose they were drowned out by spring rains. There is quite a growing interest in dog, gun and rod in this direction, and a man who can hit a bird on the wing is not such a rare character as formerly. I believe that "L. C." has been a great help, and I would not about the first to start that long controversy on the "Hunting Grouse." I was glad to see in a communication from him some time ago that he had achieved his desire—that of shooting a grouse on the wing, and I know from the graphic manner in which he describes it that he enjoyed it greatly.

JOHNSTOWN, PA., Octo.

**GUINEA-FOWL AS GAME.**—A correspondent, "Octo," calls our attention to the following note on this subject in Col. Hutchinson's work on "Dog Breaking": "Mr. M—I, an officer high in the military store department, wrote to me but last Christmas, 1863, almost in the following words: 'When stationed in Jamaica, quail and the wild guinea-fowl were the only game I ever shot. I went for hours through the long grass and brushwood, and I run for hours unless hard pressed, but when once flushed they spread through the cover and lie so close that one may almost kick them before without raising them. My dog Albert was broke on grouse before I had him out from home. A steadier or better dog you will rarely see. The first time we went out guinea-fowl he set to work as though hunting for grouse, pointing and pointing carefully when he came on the run of the birds, but from their pace through the cover, never coming up with them. This occurred the first two or three mornings, and annoyed him greatly. At last, one day, as he found the birds were running through the brush, he halted, turned round and looked up to me as much as to say, 'My poking after these fellows is all nonsense; do let me try some other dodge.' So I told him to go back on grouse, pointing and pointing off, making a wide circle until he headed his game, when he commenced beating back toward me, driving the birds before him until they were sufficiently near me, when he dashed suddenly in among them, forcing the whole pack to take wing. They spread through the surrounding grass and cover, and Albert and his mother Peggy went to work, picking up the birds singly or in pairs where they lay."

**"AFTER ANTELOPE."**—El Paso, Texas, Feb. 17. *Editor Forest and Stream.*—I desire to answer your queries concerning antelope. The things made in your issue of Feb. 8, I have to say, certainly: 1. The distance was estimated in each instance given. 2. Yes, the person making the estimates was competent to determine the distances. Really there is nothing strange in such shooting. I am quite certain that I can kill antelopes further than any of the distances given. 3. Because mistakes are mischievous and are worthless. They frequently may even be good. The people who were with them all killed. On my own defense is the common one to wit: foolishness for sport and good eating. I wish you had an antelope saddle now.—G. W. B.

**MISSOURI NOTES.**—Marville, Mo., Feb. 16.—Quail have been very plenty this season, with plenty left over for next. Chickens are not as plentiful as they were a few years ago, although one man killed, he claimed, in four days, over four hundred of them. Then again, whether he killed them in the time mentioned or not, I do not know. Rabbits are very thick, a friend of mine had the boys beat the brush for him, and in one day killed seventy-nine. Running wolves is also one of our amusements, and Uncle Jake with his pack of hounds, is a general favorite. Our jack-snipe shooting on the bottoms, when water is plenty, is very fine. Ducks and geese are usually very plenty. Our shooting club always spends a week both fall and spring in camp, when ducks and geese come. In December, I was shooting and in a corn field grown up with grass, and had a covey nicely scattered, and Tricks, my Gordon, and I were having fine sport. I had three birds down and the dog retrieving the third bird when he stopped and came to a point. I called to him; he looked at me a moment, turned and walked away from me some ten feet, came around to me in a half circle and gave me the bird. I sent him on again. He walked directly back and came to a point where he had made game with the dead bird in his mouth, and in a moment I had the pleasure of adding one more quail to my score. Have any of your readers had a like experience?—GUYDETT. [This occasionally occurs. We have often seen it.]

**NEW YORK WOODCOCK SEASON.**—Wellsville, N. Y., Feb. 20, 1893.—*Editor Forest and Stream.*—In a recent number of your esteemed paper you advocate a game law for the whole State, objecting to all local exceptions to its provisions. In this we agree when the provisions of the law do not favor the sportsmen of one part of the State, while they rob those in other parts of the sport to which they are justly entitled. For instance, we object to making the open season on woodcock begin September 1, for this reason: Nearly, if not all, the birds we have are those bred here. Sometime the light begins so early that by the last of September our birds are gone. When the last change was made, from July 9 to August 1, it was proposed to make it September 1, but we sent in a protest from this county; other counties did the same, and August 1 was finally agreed upon as a compromise. We are satisfied with the law as it is in this respect, but any change to a later date we will feel justified in opposing. We have few birds here of any kind; what we have we shall take pride in defending against robbery and murder. In capturing them we will endeavor to be sportsmen, faithfully observing the restrictions of a just game law, by example, as well as by precept, leading those who are inclined to murder for plunder to forsake their shameful practices and come over, if they will shoot, to the ranks of those whose banner is inscribed, Sense and Decency.—C. B. M.

**WORCESTER, MASS., Feb. 23.**—The *Gazette* of this afternoon in its "County News" has the following: "Mr. James F. Whitin has for some time been feeding in his yard a lot of gray squirrels and quails. They are now very tame, and will come into the house. All his family have become very much attached to them. Ambrose Nookes shot and killed several of the squirrels. Mr. Whitin remonstrated with him, but it was of no avail. He came again Wednesday afternoon and killed six quails. A warrant was made out and placed in the hands of Sheriff E. O. Bacon, who, after a class of eight or ten minutes, arrested him, and he was taken before Judge Putnam this Friday morning, and fined \$20 and costs, amounting to \$29.70, which he paid. Nookes is a stone cutter and is employed by George M. Blanchard, of Whitinsville. Mr. Whitin lives at Whitins, a station on the Providence & Worcester Railroad, in the town of Northbridge. Nookes must be a hard-hearted wretch."

**GENERAL ITTONE.**—Dexter, Ill., Feb. 14.—The great seal has just left us. I was fearful that every quail in Central Illinois would be starved and frozen to death. But I am happy to learn of at least two birds that have survived the storm. One covey of twenty-two was counted near our house yesterday. And a neighbor has been caring for a covey of twenty-one that has been feeding in his barn lot (and apparently quite tame) all winter. We have not many prairie chickens near here, but there are some left. I have seen none this winter before for the past few years. I shot over eighty in one flock a few days ago. I suppose they have all "bunched," and they were all there for eight or ten miles around.—D. T. S.

**GUN BARREL OBSTRUCTIONS.**—When hunting in Michigan a year ago last fall I met some boys, and let one of them hold my gun, a single barrel shotgun, for a minute. He slipped a small snake down the barrel. In trying to get it out I got wedged in at about three inches of the muzzle. I could not start it an inch, and finally gave up trying. I very foolishly fired the charge, but it did not hurt the gun a particle, though it nearly knocked me over. At another time I got a shot cartridge stuck about half way down the barrel, and fired it without any injury either to the gun or myself.—F. L. D. (Boston, Feb. 17, 1893).

**THE QUEBEC LAW.**—By an act now before the Legislature of the Province of Quebec, it is proposed that the game laws of the Province be amended so that it shall be forbidden to hunt or trap live between March 1 and October 1, yearly. Also that it be forbidden to hunt or take any wild swan, wild goose, or wild duck of any kind, wild geese or teal, between April 15 and September 1, yearly, and any Canada goose between May 15 and September 1, in each year. The act formerly read for hare, March 1 to November 1; and for Canada goose from April 15 to September 1.

**MAINE DEER.**—A correspondent of the *Ellsworth American* says that the number of deer shipped from Maine the past year has exceeded 100,000, and that in 1892, out of three-fourths of those deer were killed by less than 100 men, and a curious fact is that not one in ten of the venison saddles shipped before the ponds froze had a bullet hole upon them, and, of those that had the heads on, nine out of ten were shot in the back of the head, thus proving that they were slaughtered in the water, driven in by hounds.

**MONTANA GROUSE SEASON.**—Port Chester, N. Y., Feb. 12.—Referring to your schedule of game laws published December 1, I would say that I wish to see the grouse, ptarmigan and "foot hens" (Franklin's grouse), protected in Montana till August 15, not August 1, as stated.—ALBUQUERQUE.

**FLORIDA NOTES.**—Cedar Key, Florida, Feb. 16.—It takes about 100 shells for a full day's hunt here. I was out yesterday and killed about forty birds—ducks, snipe, curlew, marsh hens, etc. They hunt by taking a boat and going to the islands along the coast, where there are any quantity of birds of all kinds, though mostly ducks. I saw three Philadelphia sportsmen one day in from the country a few days ago with 150 quail which they killed in one day. I would take a quail hunt, but can get no dog. It is very warm; temperature about 85° during the day.—WM. EYER.

**"OUR NATIONAL BIRD."**—Hartford, Conn., Feb. 22.—The lower house of the Legislature to-day discussed the bill for the protection of American eagles. A number of speech-makers about "our national bird" were made. Many members poked all sorts of fun at the bill, but it was finally passed by a rising vote (at the suggestion of patriotic members). The bill had its outgrowth in a desire of residents of the venerable town of Litchfield to preserve some eagles which have been in that section for years, and which sportsmen are gradually killing off.

**ENFORCING THE MAINE LAW.**—Bangor, Me., Feb. 25, 1893.—James E. Berry, American Express agent at Bar Harbor, Mount Desert, upon complaint of Fish and Game Warden Morse, was fined \$50 for shipping trout during close time in November. Geo. L. Bunker, for killing one deer Feb. 7, upon complaint of same officer, was fined \$41.50. Freeman Collins, for killing a deer Feb. 20, was fined \$40, on complaint of same officer.—LEX TALONIS.

**MESSRS. WILLIAM READ & SONS, of Boston, Mass., have removed from their former establishment in Faneuil Hall to more commodious quarters at No. 107 Washington street. The firm is well-known in New England and throughout the country as dealers in first-class goods. We bespeak for the Messrs. Read in their new establishment the patronage of an increasing host of friends.**

**OREGON DEER ARE** reported more plentiful in the hills along the coast than ever before known, and have become quite tame since the game law went into effect, in some places running with the sheep.

**MAINE SUNDAY SHOOTING.**—Maine has passed a law forbidding the killing of birds and game on Sunday, but an amendment to prohibit fishing was voted down.

#### Camp Fire Flickerings.

"That reminds me."

**JOHN H.**, as it apt to be the case with whole-souled sportsmen, is a thoroughbred joker, and lets no opportunity go by when he can raise the laugh in a quiet way against any of the boys. Sitting in a hotel the other day conversing with a friend about a recent trip to Sandusky Bay, some remarks were made touching some extraordinary shots at ducks. These remarks caught the ear of a commercial traveler, who all unasked, chipped in and immediately monopolized the whole conversation with glowing accounts of his wonderful skill with the gun. "Ninety-six glass balls straight was a bagshot" to him. "Nine out of ten shots at grouse in the worst of cover, you know," had been his season's average for years; and the number of matches in which he had come out victorious was simply countless. John listened attentively, and after the first he said to his associate, and when the fellow stopped for breath, asked in an innocent voice: "What charge did you use in that last match with Bogardus when you beat him ten birds?"

"O, just an ordinary charge," answered the C. T.

"Well, but how much by actual measurement? I would like to know."

"O, just the same as I use at all times."

"Well, what do you use at all times?"

"O, sometime more and sometime less, just as it happens." Then thinking to see his way out of a difficulty, he continued, "How much do you use, Mr. H.?"

"Well," replied John, "in my every day field gun which is a very heavy piece, a thirty-six bore weighing eighteen pounds, I use seventeen drams of powder and four drams of shot."

The commercial man's face brightened, for he now saw his way out, and speaking up boldly, he said: "Well, you shoot a heavier gun than I do, so of course you can use a bigger load; now I only dare use in my thirty-five bore, fifteen pound gun, sixteen drams of powder and three and a half drams of shot, and I tell you even then I have a pretty sore shoulder after an all day's shoot."

The boys laid by this time gathered around, and all say the point but the C. T., who, shouldering his gripsack, moved complacently out, scowling fiercely at the roving crowd as much as to say: "What in thunder you laughing at?"

J. W. D. L.

It was in September. The owls had killed some of our most valuable fowls. One night I was aroused by loud squalling and cackling among some fowls that roosted in some cedar trees that stood almost under the window where I slept.

I jumped up, seized my gun and ran out. I could hear the owl as he darted at his victim, but would fail to strike it, but I could not see it in the darkness. I threw up my gun and touch both triggers—a splendid snap shot—I hear something strike the ground. Walking up to the tree, there lies a turkey, and further on a chicken.

PORT ROYAL, TENN.

I like your new departure in the line of illustrations; the sketches of dogs on point were excellent, and "Asleep at his Post" is still better. An incident precisely like that occurred last fall to an attaché of the Rochester post office. A fellow P. O. man, who is an expert fowler, took him duck shooting to Bradocks Bay, and him in a blind on a good point, and drove a big flock of ducks to the decoys. After waiting an age, and not seeing his friend shoot, the man in the boat went ashore and found his companion sleeping.

MEX.

ROCHESTER, N. Y., Feb. 23.

case was a test suit, the complaint having been made under the law passed in 1879, found on page 190 of the public acts of that year. The gist of the charge was that defendants had used fish traps to interrupt the course of fish in Saginaw River, the date of the commission of the offense being February 1-12, inclusive. C. W. Higley, of Jackson, fish warden, was present to assist the prosecution. A Mr. Paron, the first witness for the prosecution, said that the defendants were fishermen and used trap nets. He thought they lifted the nets on February 3; it might have been February 5, but he was positive as to the date. Harry Harbeck said he dealt in fish and was acquainted with defendants; knew where they fished near the mouth of the river; they had one net between the range lights and another outside; did not know how far apart they were; never measured the distance; did not know whether they fished in the river or outside; thought it was in the river; thought Saginaw River was a harbor; had retreated to Saginaw River during a storm for shelter. John Sharp had been fishing for ten years; don't know where their nets are; saw the stakes and supposed the nets were there; never saw defendants lift the nets; should say that the range lights are in Saginaw River, one of them at least; the river begins to widen about half way between the lights. The prosecution reviewed the testimony of the witnesses and endeavored to show that the mouth of the Saginaw River, where the nets were set, was not a harbor; that a boat could anchor further out with perfect safety. The defense said that the time sworn to in the complaint had not been fixed by the witnesses; that according to Tiffany's criminal law it must be shown that each of the four defendants were guilty as charged; the guilt of only one had been partially shown, and therefore the four could not be convicted. After some further remarks from the prosecution, the jury retired and returned a verdict of "not guilty." The defendants were therefore discharged. Thus the bottom has been kicked out of the first fish suit in Bay county under the act of 1879.

"TENDERFOOT" POACHED.—DENVER, Colo., Feb. 20.—We noticed in your last issue (Feb. 15) a communication from "Tenderfoot," Colorado, Jan. 29, giving a very graphic description of fishing through the ice. We take it for granted that the fish captured were trout and do not doubt that the fishermen who were fishing in this way were not a bit anxious to herald abroad this most flagrant violation of our fish laws. For "Tenderfoot's" benefit we will add that the open season for trout fishing in Colorado is from July 1 to December 1, and that a diet of "hog, venison and rabbit" is preferable to a violation of the same.—FISHERMAN.

BETHABARA WOOD.—PHILADELPHIA, Feb. 21.—*Editor Forest and Stream:* In your issue of 1st inst. you say: "Bethabara wood looks like greenheart, if not the same." Now the facts are, that it looks like it only as much as the large-mouth black bass resembles the small-mouth (viz., only partially so). Bethabara is much darker in color and closer grain, and aside from its being more elastic and stronger than greenheart. It is in it a resinous red dye, which runs out in working it, so that in washing the hands with soap will color the water a brick-red. This is an infallible test as between the two woods.—A. B. SUPLEY.

### TRANSPORTATION OF ADULT BLACK BASS.

*Editor Forest and Stream:* I send you the following interesting and instructive account of the transportation of over six hundred adult black bass from Sandusky, O., to the lake of the South Fork Fishing and Hunting Club, of Pittsburgh, Pa. The whole matter, under the charge and direction of Mr. Oscar L. Listel, vice-president of the club, is so well described, that I feel it necessary to the undertaking, giving him such general advice and information as I was possessed of.

The remarkable success attending Mr. McIntosh's efforts, and the ingenuity and satisfactory workings of his device for aerating the water, and his entire methods of transportation, will be useful guides for the imitation of others for similar purposes. He writes:

PITTSBURGH, Feb. 13, 1883.

Dr. J. A. Henshall, *Cynthiana, Ky.*  
MY DEAR SIR—Your favor of December 7, 1882, has been quietly resting on my desk awaiting a time when I could fully reply to it. Two years ago our club, the South Fork Fishing and Hunting Club, had a desire to stock their lake in the mountains with black bass, but as it was thought that failure was almost sure to attend any attempt in that direction, no person but myself could be obtained to undertake the enterprise. The club had secured \$500 at my disposal. The first thing to be done was to procure the fish. The only person who would contract to furnish them was Oscar Listel, of Sandusky, with whom I contracted for one thousand bass, to average one and a half pounds in weight, none to weigh less than three-quarters of a pound, and he ready for delivery in Sandusky about the first of May.

Owing to extreme backwardness of the season, and large accumulations of ice in the lake and bay, no fish were ready at the time agreed upon, and it was not until the first of the last of May that bass Mr. Listel might be able to procure by that time. The information which I could obtain on the subject of transporting large numbers of live adult fish was extremely meager; none of it being derived from experience, and I was reluctantly thrown upon my own inventive resources.

First I arranged for a baggage car, and made a diagram of it. Then I had four fifteen cask tanks, three feet high and three feet in diameter, with both heads in, and cut out the eighteen inches in diameter in the top head of each cask. I also procured five galvanized iron tanks, each three feet in diameter and five feet high, entirely open at the top. I then procured an air pump, with both heads in, and cut out the top of the air escape of this pump. I attached one end of a piece of rubber hose, fifty feet in length and one inch diameter. The other end of the hose I attached to an affair of my own contriving, consisting of a cone of wood, two inches in diameter and one inch in diameter, joined together so as to form a hollow square; then two cross tubes, the ends of which are fitted to holes cut into the inside of the hollow square tubes.

This affair is then laid flat on the ground, and the intersection of the cross tubes and on top, a hole one inch in diameter is cut, over which is placed one end of a tin tube, one inch in diameter and three feet long, open at both ends, and being at right angles with the vertical level. This is soldered at the intersection and about 300 small holes punched into the upper surface. The remaining end of the rubber hose is drawn down over the upper end of the upright tube and the whole is complete and ready for use. Holding the upper end of the tube in the hand the perforated portion is placed over the bottom of the cask, the lever of the air pump is worked and im-

mediately the air passes through the 300 small holes and comes bubbling up through the water. The "airfall" is easily moved around through the water, thus thoroughly aerating all parts of it.

Not wishing to have "all my eggs in one basket," I arranged another affair, of which I give you a meager description. A funnel eighteen inches in diameter at the top and four inches at its intersection, with a four-inch horizontal tube to which five four-inch tubes, six inches long, are soldered to the lower side, a four-inch hole being cut into each intersection. The lower tubes are closed with corks, with which are perforated with small holes. This apparatus was fastened to the side of the car in such manner that each tube hung immediately over the center of the top of a cask. The water in these casks was aerated by tapping the top of the casks and pouring it into the funnel, whence it ran along the horizontal tube and through the perforated holes in the lower ends of dependent tubes. Closed caps were made to fit the latter which could be placed on one or more of them, and thus continue the aeration to any particular cask desired.

In addition to the above, I had several tin buckets made, eighteen inches deep and eight inches in diameter, the bottoms being perforated with a large number of small holes. Hooks were secured inside of the buckets in such manner as to bring the buckets, when hung on the hooks, immediately over the center of the casks. Aeration was performed by dipping the buckets into the casks, filling them with water, and hanging them on the hooks above the casks. On May 30th of May, 1882, I took with me two pitcask and other paraphernalia in position on the car, not forgetting a couple of thermometers, and forwarded it to Sandusky, following next day with another member of the club and two men who had for a long time been in my employ and whom I knew I would find faithful and able to put in two days and a night without sleep or rest. We arrived in Sandusky on the forenoon of June 1, the rain pouring down in torrents and making a tremendous and very disagreeable day. As soon as we landed we went to the lake, and the first thing we did, as long as possible, we did not commence putting them into the casks until about two o'clock. The party who was to furnish the fish had them "corralled" in a lot about twenty-four feet square. Our car was placed on a track near the net, the track at this point running out into the bay. We had a long, hard and tedious job getting the fish on board the car and into the casks, but at six o'clock were ready to start. When the train had started we proceeded on our way, the cars being distant, having taken on board about two tons of ice. Having arranged beforehand with the officials of the several railroads over which we would have to go for transportation on fast trains, we had no trouble in procuring a special trip, and when the train took us to take us from Sandusky to Cleveland arrived at Sandusky it was about two hours behind time, which would cause us to miss connection at Cleveland and throw us back twenty-four hours in arranging for our destination, so in a fit of temper I telegraphed to the manager of the Cleveland & Pittsburgh Railroad, requesting that the train on that road be held until our arrival. I received no answer, but on arriving at Cleveland was delighted to find that my request had been complied with. Our car was soon shifted into position and we were again on the way.

We arrived at Alliance in time to have our car attached to the fast express on the Pittsburgh, Fort Wayne & Chicago Railway, and at eight o'clock were en route for Cleveland at Pittsburgh, where we took on board another ton of ice, and after a stop of less than half an hour were off on the Pennsylvania Railroad "fast day express," bound for South Fork, which place we reached at five o'clock. Several members of the club were on hand with wagons, on which we had to transport the casks and fish two and a half miles over rough mountainous roads to the lake of the South Fork Fishing and Hunting Club, where we arrived at five o'clock P. M. We put into the lake in apparent good condition six hundred fish, weighing from three-quarters of a pound to two and a half pounds each, losing about sixty of the six hundred and sixty with which we started from Sandusky.

During the few days following quite a number of dead fish came to the surface of the water, perhaps one hundred, which is not to be wondered at considering the very warm weather, the numerous open air tanks, and the long time the fish had been confined, many of them, in close quarters in Sandusky Bay.

I can assure you there was not much rest taken by any of our party, as the air pump was working all day, and we were all busy in aerating the water. By constant attention and the free use of ice the temperature of the water in the casks was kept down to about sixty degrees.

We are all quite well satisfied with the results, as along the shores of the lake a large number of fish may be seen, a great many of from six to eight inches in length jumping out of the water, apparently after insects.

I am just a little proud of my invention for aerating water by means of air pump apparatus as described. If any body has a valid prior claim let me know and I'll retire. The nearest approach to it that I know of consists in pumping air into the water through a hand bellows—rather a slow process, but you have no doubt a great deal of time and money to transport six hundred or seven hundred fish, averaging one and a half pounds each, is quite a different affair from transporting fry one inch in length.

Should you be in this city, I would be pleased to visit our lake with me.

Permit me to express my thanks for the pleasure I derive from reading your articles in FOREST AND STREAM, on Florida.

Very truly yours,

WM. A. MCINTOSH.

After the reception of the foregoing letter I at once wrote Mr. McIntosh to ascertain if he had taken notice of the mortality of the fish in the different tanks and casks, so that the relative merits of the different aeration might be arrived at. The following is his reply:

PITTSBURGH, Feb. 13, 1883.

Dr. J. A. Henshall, *Cynthiana, Ky.*  
DEAR SIR—I have received your favor of the 10th inst., and in reply would say that constant attention was required of all parties engaged in applying ice, pumping air and raising water from casks into aerating apparatus, and I being ill, it was impossible to take full charge of the matter. The only other method of aerating will be found efficient, i. e., the air pump or the funnel and pipes. If I were to undertake a similar job, I would try to arrange for two large tanks, one on each side of the car, and a force pump. Then, by suspending a wide, perforated trough over each tank, the water could be forced from the tanks by means of the force pump into the troughs. The tanks in the car would be used for the purpose of holding the water, but could be obtained in a great measure by working the pumps by means of a belt connection with one of the car wheels. Yours truly,

WM. A. MCINTOSH.

The lake of the South Fork Fishing and Hunting Club is about 90 miles east of Pittsburgh, and 2½ miles from South Fork station on the Pennsylvania Railroad. It is formed by the building of a dam 1,200 feet long, between two ranges of mountains. The lake covers an area of 9,000 acres, and is about three-fourths of a mile in width, and nearly three miles long. The water varies in depth, being about sixty feet deep at the dam, and gradually decreasing in depth to the head of the lake. The water is very pure, and is fed by a mountain stream, the south branch of the Conewago River. A part of the bottom of the lake is

the original bed of the stream, some twenty or thirty feet wide, rock and gravel. The rest of the bottom of the lake is for the most part ordinary soil, with a mixture of some gravel.

These particulars I received two years ago from Mr. McIntosh. The black bass of Lake Erie cannot fail to do well and increase rapidly, and grow to a very large size in this fine lake, provided they have plenty of natural food.

J. A. HENSALL.

CYNTHIANA, Ky., Feb. 1883.

TEMPERATURE OF WISCONSIN LAKES.—Messrs. E. M. Gifford and G. W. Peckham, their investigations into the temperature of Wisconsin lakes found, that at a depth of eighty feet there was a temperature of forty-two degrees Fahrenheit in summer and thirty-nine or lower in winter.

### FIXTURES.

#### BENCH SHOWS.

March 29, 27, and 28, 1883.—Dominion of Canada Kennel Club. Bench Show, at Ottawa, Canada. Charles Lincoln, Superintendent. April 3, 4, and 5, 1883. Western Pennsylvania Fowl Society's Fifth Annual Show, at Pittsburgh, Pa. Entries for the English Show Derby, for English setters wheeled on or after January 1, 1882, closed February 1, 1883. Chas. Lincoln Superintendent. C. H. Elbin, Secretary.

May 8, 9, 10 and 11, 1883.—Westminster Kennel Club, Seventh Annual Bench Show, Madison Square Garden, New York City. Chas. Lincoln, Super.

To insure prompt attention communications should be addressed to the Forest and Stream Publishing Co., and not to individuals, in order otherwise from the latter matters of importance are liable to delay.

### THE WASHINGTON DOG SHOW.

THE bench show held at Washington last week under the management of Mr. Charles Lincoln was quite a success. There were 292 entries, nearly all of them present. Including the puppies there were over 400 dogs in the building. The show was held in the Rotunda of the Hotel, which is well adapted for the purpose except that it is not large enough. The quality of the dogs shown was excellent, many of the best animals in the country being present. We were surprised to see so many good dogs of the breed from Washington. The show was very well conducted. A large number of the most prominent men in the country were present, and many of them expressed their delight at beholding so grand an exhibition. The ladies were also out in force; many of the queens of the breed were present, and many of the cutest and loveliest were lavishly bestowed upon the lucky dogs.

We were pleased to learn that Mr. Lincoln was able to show a handsome balance upon the right side of his books. The judges upon the whole were fairly satisfactory. Owing to pressing matters of business (apt. Wise telegraphed at the last moment that it would be impossible for him to be present, and the exhibitors selected Mr. Chas. H. Mason to fill his stead) we were of course much disappointed, nearly all the judges assigned to him, and in these he made but few mistakes. Mr. Watson also understands the classes he judged, and his decisions were generally indorsed. We were sorry to see that the judges were not very good indeed. A large number of the most prominent men in the country were present, and many of them expressed their delight at beholding so grand an exhibition. The ladies were also out in force; many of the queens of the breed were present, and many of the cutest and loveliest were lavishly bestowed upon the lucky dogs.

Everything pertaining to the show, so far as Mr. Lincoln was concerned, was of course managed to the satisfaction of all; we have never seen dogs better cared for. We understand that it is Mr. Lincoln's intention to hold an annual bench show at Washington. Should he decide to do this, we think we shall be well sustained by both exhibitors and the public.

Friday evening was the occasion of a very interesting ceremony. In behalf of the numerous friends and admirers of Old Leicester, Col. Tom Watson presented a magnificent silver collar, upon which was his name in large raised letters. The Colonel was very happy in his allusions to events in the career of the grand old dog. Closing with a glowing tribute to his usefulness, he then turned around and placed the collar on the neck of the hero and crowned him with a wreath of laurel. Loud and long continued applause greeted the graceful act. Col. Ochiltree then turned to the beautiful Princess III., and in a few words she was presented her with the medal she had won. She was also applauded to the echo, and for a long time admiring crowds gathered around and paid honor to the wonderful pair. Below will be found our comments upon the dogs.

#### MASTIFFS.

There were three grand dogs in the dog class. Cassar was absent. Major, who was first, is a magnificent animal and a credit to his sire, champion Girth. Tiny and Jumbo were also very good. Croyle, in the bitch class, won first, she is a splendid specimen of the breed, although rather old to show well. Dinah II., who was placed second, is a very well bred bitch, but lacks size, she like her mother, has her good points and good looks. Leda, the only other entry, we do not like as a mastiff. Only one puppy was entered, Europa, who gives promise of turning out something nice.

#### ST. BERNARDS.

The St. Bernards were very good all through, with scarcely a bad one in the lot. The best of the breed, the champion class was properly divided into a dog and bitch class. Harold, the only dog, was in grand form. Judy, who won in the bitch class, also looked well. In the rough-coated dog class St. Elmo was a very fine dog, but he was not a very good specimen of the breed. He was given the prize to which he was entitled. He is a very fair animal, although he stands too high behind and is rather weak in the hind legs, which he may outgrow. He reminds us, especially in head, of Snip, who was the champion of the breed. Marcus was a very good specimen of the breed, but he was not a very good specimen of the breed. He was given the prize to which he was entitled. He is a very fair animal, although he stands too high behind and is rather weak in the hind legs, which he may outgrow. He reminds us, especially in head, of Snip, who was the champion of the breed. Marcus was a very good specimen of the breed, but he was not a very good specimen of the breed. He was given the prize to which he was entitled. He is a very fair animal, although he stands too high behind and is rather weak in the hind legs, which he may outgrow. He reminds us, especially in head, of Snip, who was the champion of the breed. Marcus was a very good specimen of the breed, but he was not a very good specimen of the breed. He was given the prize to which he was entitled. He is a very fair animal, although he stands too high behind and is rather weak in the hind legs, which he may outgrow. He reminds us, especially in head, of Snip, who was the champion of the breed. Marcus was a very good specimen of the breed, but he was not a very good specimen of the breed. He was given the prize to which he was entitled. He is a very fair animal, although he stands too high behind and is rather weak in the hind legs, which he may outgrow. He reminds us, especially in head, of Snip, who was the champion of the breed. Marcus was a very good specimen of the breed, but he was not a very good specimen of the breed. He was given the prize to which he was entitled. He is a very fair animal, although he stands too high behind and is rather weak in the hind legs, which he may outgrow. He reminds us, especially in head, of Snip, who was the champion of the breed. **Class Q.—**For the best spaniel.—Col. Stuart Taylor's Benedict.

**Class R.—**For the best Skye terrier owned by a lady residing in Washington.

**Class S.—**For best pair of foxhounds (no entries, offered for the best English setter puppy owned in Washington.—Mr. Edward L. Mills's Diana).

**Class T.—**For the best setter or pointer owned in Washington.—Miss L. Roeske's Cossack.

**Class U.—**For the best collie.—Mr. Thomas H. Terry's Robin Adair.

## THE ST. BERNARD.

IT is always with delight I welcome any reference in your columns to the St. Bernard dog, and it was therefore with especial pleasure that I read the letter of so great an authority as you recently published in your issue of the 15th of February. In that letter Mr. Gresham contends that the body color of the breed should be either orange tawny or grizzle, with white markings, which latter are defined to be a white blaze up the face, uniting with a white throat ruff; and he declares that the breed is not objects to on a ground that they can be produced by various crosses, and should therefore be regarded with suspicion (though the same objection, he admits, cannot be urged against the Scotch deerhound). He certainly has no right to be on behalf of this last-named specimen that I now take up the cudgel.

I think it will be conceded that what we are aiming at is a head from which the body may be taken. If a by-gone cross shall be eliminated, and certain markings and peculiarities such as double dew claws, fixed,

If I am correct in this supposition, then I contend that the white-bodied dog with evenly marked head should be placed on an equality with dogs whose body color is orange tawny or grizzle. For the first-named dog shows the markings just as plainly as the other two, and is certainly, in color, further removed from any suspicion of Newfoundland or mastiff blood than the second named. He certainly will be considered far handsomer and more noble looking, will be found that the St. Bernard dog is kept up both on this continent and in England solely as a companion and guard, for which his beauty, docility and size pre-eminently fit him, it seems to me. It would hardly be fair to encourage the breed as much as possible. That the white body and evenly marked head is the color most in favor with the general public, I had fair proof last week at the Simcoe Dog Show. I saw an equality with dogs whose body color is orange tawny or grizzle, with white markings, which latter are defined to be a white blaze up the face, uniting with a white throat ruff; and he declares that the breed is not objects to on a ground that they can be produced by various crosses, and should therefore be regarded with suspicion (though the same objection, he admits, cannot be urged against the Scotch deerhound). He certainly has no right to be on behalf of this last-named specimen that I now take up the cudgel.

Mr. Nevins Thwaitt, an authority scarcely second to Mr. Gresham, writing in the *Venezia Gazette*, of October, 1880, says: "I like the white body with evenly marked head, as when washed and in good coat they look so handsome." He also mentions the fact that the two bitches he saw at the Monastery were entirely white, and that the four puppies were all marked on one side of the head.

In conclusion I would point out that if the monks' standard of color is to be strictly followed, then, too, in reason we must admit that the variety of colors of the hair of the dogs they prefer to be intermediate between that of the rough and smooth varieties, thinking it better suited to the work the dogs have to perform. Were this done, which personally I heartily approve, the color of the hair of the dogs would lead to lower their colors to possibly one of a more correct but certainly not so beautiful a type. FRED. W. ROTHEA.

SINCE, Ont., Feb. 20, 1881.

## EASTERN FIELD TRIALS CLUB.

At a meeting of the Executive Committee of the Eastern Field Trials Club, held at Belmont's on Tuesday evening, February 20, the following gentlemen were present: Messrs. Elliott Smith, Robert C. Cornell, J. E. I. Trainger, W. A. Coster, Geo. Leach, A. E. Godfrey and H. E. Hamilton. The committee on annual supper and the committee on running trials were reported. The committee on incorporation reported that the club was now legally incorporated. The committee on ground submitted the following report:

To the Executive Committee of the Eastern Field Trials Club.  
Your committee, appointed at the annual meeting of the club, held at Belmont's on Tuesday evening, February 20, 1881, do respectfully report:

That they have met from time to time, and have authorized the secretary of the club to proceed to High Point and arrange for the trial grounds, and to purchase the land of the game and other sportsmen who own the grounds for the trials.

That Mr. Coster reports that he has been able to secure about 3,500 acres of land, bounded on the north by the railroad to Washington, on the east by Deep River, on the south by a line running from High Point to Ashburn, and on the west by the main road to High Point.

That Mr. Coster has interviewed each of the land owners within the described section, and found them all friendly to the club, and ready to make arrangements for the trials. The payment to them of two dollars per acre for each acre they show. The lands to be drawn immediately before the trials, and payment to be made according to the birds shot.

The member of the club conducting such drawing to give a certificate to the land owner of the number of coverts found, which will be cashed on presentation to the treasurer.

The committee also reported that they had secured portions of the ground and found more birds than were found at the late trials. From the report of the farmers and his personal investigation, it is estimated that there are at present on the grounds from forty to sixty coverts, averages, perhaps, eight hundred.

Annexed to this report is a rough map made by Mr. Co-

ter, showing the location of the grounds, names of owners, and a schedule designating the acreage of each owner.

Your committee further report that in their judgment about five hundred quail should be set out during the present month. Allowing strictly within the province of their appointment, they have written to High Point for the purpose of securing as many as possible up to five hundred birds, and have requested Mr. Abner Holden to have them set out.

Your committee further reports that Mr. Coster has made inquiries of residents in the neighborhood of Salisbury, N. C., where grounds were offered to the club, but that there were no grounds within fifteen miles of Salisbury available, and that it would be necessary to sleep at Salisbury and take a train every morning and evening to and from the grounds.

Your committee are of the opinion that the grounds at High Point are the most available for the purposes of the club, and they recommend that the grounds designated on the accompanying map be accepted by the club.

Your committee further report that Mr. Coster has arranged with one of the hotel keepers at High Point to board any number of handlers up to 100 for \$1.25 per day, including the board of one dog, and 25 cents extra for each extra dog per day.

The lively stable will furnish a three-seated wagon for \$4 per day, or \$2 for half a day with room for five persons and the driver. A buggy for \$5.50 per day, and \$1.50 for half a day for two persons. Saddle-horses \$1.50 per day, and \$1 for half a day, and an outfit for 25 cents per day, to go three and a half miles from High Point.

Your committee further reports that Mr. Coster reports that no objection will be made by the land owners to shooting by members, under the permission of the club, over the grounds reserved.

All of which is respectfully submitted.

(Signed) GEO. T. LEACH,  
ELLIS SMITH,  
J. E. GODFREY,  
WASHINGTON A. COSTER.

The report was approved and adopted, and the committee were authorized to carry out the arrangements proposed in their report. It was also voted that every member of the club be furnished with one signed by the president and secretary, entitling him to shoot over the preserved club grounds after the trials until the close of the season, and that the secretary furnish each land owner a copy of such card, the number of birds that may be killed to be limited to such number as the committee may designate at the time of the trials.

Mr. John Boland, of Avon, N. Y., and Mr. D. S. Gregory, of New York, were elected members. It was voted that Mr. E. H. Smith be chairman of the committee on the field trials of the club, unless elected by the National American Gun Club, and that the National American Gun Club be informed of the action of the club. It was also voted not to consider the action of the club in relation to delinquency of Mr. W. Mitchell, and that he be so informed. Nov. 19, was decided upon for the commencement of the field trials of 1893, which will probably allow the All-Aged State to commence on the 31st. Twenty-five dollars was appropriated to be given in prizes at the coming year's show of the Westminster Kennel Club for the best field trial winners exhibited—setters and pointers.

### THE SIMCOE BENCH SHOW.

THE fourth annual exhibition of the Simcoe Poultry, Dog and Pet Stock Association was held at Simcoe, Canada, on Feb. 14, 15 and 16, and was one of the largest and most nearly all of the prominent breeders in the Province. The show was held in the Military Drill Shed, which is spacious, well lighted and ventilated. The coops for the poultry occupied the center, and the kennels for the dogs were arranged around the sides. There were quite a number of first-class specimens of the different breeds exhibited, among them are some not unknown to fame.

In the English setter class, Mr. T. G. Davey, of London, was the highest prize winner, with a dog named "Lilly" and his bitch "Glenlilly." I thought Dan O'Shley's Lilly full as good as the latter. Jack and Jack in the Gordon class made a splendid brace, and it took Dr. Niven some time to decide between them. I thought the specimen of the Irish setter and easily won first. There were quite a number of very good setter puppies present. Ned and Ranger, in the pointers, were both good and nearly equal. Dan O'Shley's couple of pointers, "Forster" and "Ranger," were both good, and the latter was a very good specimen. The English pointer was also well represented, and the best of the breed was shown at Ottawa, Pittsburgh and New York. Fennel, in the terriers, is the best one that I ever saw. Mr. Gibson should send him to the large shows, where I am sure his merits would be fully appreciated. The English bulldog, "Bobby," and Black Mac, were also remarkably good. Mr. Rothera's splendid collection of St. Bernards were the best feature of the show, and attracted a great deal of attention. His magnificent "Prince" and "Princess" were the best animals in the show, an honor that he richly merited. Dr. Niven, of London, filled the position very acceptably. Following are the awards:

English Setters.—1st, T. G. Davey, London, Laver Rock. Bitches.—1st, T. G. Davey, London, Glenlilly. Dan O'Shley, London, Lilly. Black and Tan Setters.—1st, Lorne Campbell, Jack. 2d, J. P. Duffin, London, Jack. Vets. 1st, D. Hart. Fox Terriers.—1st, D. Hart, London, D. Flinley. Setter Puppies.—1st, D. O'Shley, London, Lilly. 2d, D. Durward. Pointers.—1st, Capt. Ermattinger, Ned. 2d, John Hall, Hamilton, Ranger. Foxhounds.—1st and 2d, D. O'Shley, London, Forster and Ringwood. Englishes.—1st and 2d, D. O'Shley, London, Music II, and Rover. Fox Terriers.—1st, R. Gibson, Merton, Music I. 2d, D. O'Shley, London. Other kind of Terriers.—1st and 2d, D. O'Shley, London, Margo and Lady. Field Spaniels.—1st, J. G. Marshall, Woodstock, Bob, Jr. 2d, J. R. Meek, Black Mac. Water Spaniels.—1st, P. D. Hart, Curly. Cocker Spaniels.—1st, D. O'Shley, London, Verne. 2d, T. Marshall, Col. 3d, W. M. Lorne, Lorn. 4th, B. L. G. Glazebrook. St. Bernards.—1st, W. M. Lorne, Lorn. 2d, W. M. Lorne, Lorn. Foxes.—1st, D. O'Shley, London, 2d, Lorne Campbell, Jack. Bull and Bull Terriers.—1st, J. D. Lorne, Lorn. 2d, J. D. Lorne, Lorn. Bull not otherwise classified.—Equal 1st, Dr. H. D. Durward, D. O'Shley, London. Special Prizes.—For the best dog on exhibition—Fred W. Rothera, St. Bernard Prince. For best three English setters—T. G. Davey, London, Laver Rock and Glenlilly. For best pointer—John Hall, Ranger. For best cocker spaniel—D. O'Shley, London, Verne. For best English bulldog—W. M. Lorne, Lorn. For best fox terrier—R. Gibson, Merton. For best black and tan setter—D. Hart, Curly. For best Irish setter—Chas. A. Flinley, Pato and Vets. For best black terrier—R. Gibson, Merton. For best English bulldog—W. M. Lorne, Lorn. For best black and tan setter—D. O'Shley, London, Music II.

**KENNEL NOTES.**—The publication of the Kennel Notes is for the benefit of dog owners, breeders and buyers. We are not anxious of asking too much when we request correspondents who have notes to write, to follow the style of the printed notes. A very little care on the part of our friends will insure early and correct publication of news.

**THE PITTSBURGH DOG SHOW.**—Everything promises well for the Pittsburgh show, and the managers are sanguine in the belief that it will far surpass any that they have yet seen. Major J. M. Taylor, of Lexington, Ky., will judge the English, Irish and Gordon setters and pointers. The other judges have not yet been selected.

**NEW YORK DOG SHOW.**—Mr. Charles Lincoln is in the city attending to the preliminary arrangements for the seventh annual bench show of the Westminster Kennel Club. An office has been secured at No. 23 Park Row, rooms 257 and 258. The office will be open from 10 to 12, at which time the prize list and entry blanks will be ready. A number of changes in the classification will be made and some new classes added.

### KENNEL NOTES.

#### NOTICE TO CORRESPONDENTS.

Kennel notes are inserted in this column free of charge. To insure publication of notes, correspondents MUST GIVE the following particulars of each animal:

1. Color.
2. Breed.
3. Sex.
4. Age, or
5. Date of birth, of breeding or
6. Name and residence of owner, buyer or seller.
7. Stock, with sire and dam.
8. Owner of sire.
9. Dam, with her sire and dam.
10. Owner of dam.

All names must be plainly written. Communication on one side of paper only, and signed with writer's name.

#### NAMES CLAIMED.

See instructions at head of this column.  
Study Book, *Stanton Hunt, Steel Bone*. By Mr. Edward O'Neil, New Orleans, La., for pointer pups, whelped Oct. 12, 1892, by his blood out of Mr. J. C. Walker's Pick.

*Pointing*. By Mr. W. R. T. Vanderput, Pittsburg, Pa., for liver and white pointer bitches, whelped Oct. 2, 1892 (Don-Luck).

*Jersey Lilly*. By Mr. J. W. Rushforth, Yonkers, N. Y., for liver, with white feet and breast cocker spaniel bitch, whelped Oct. 20, 1892 (Prime's Joe—Beauty).

*Pointing*. By Mr. C. V. V. Sewell, for three whelps, whelped Nov. 4, 1892, at Farrytown, N. Y., out of Lou (Skip—Nanna) by Guess (Toby—Flora).

*Tagg*. By Mr. M. W. Oliver, Buffalo, N. Y., for black and tan Gordon setter bitch, whelped May 23, 1892, by Ray (Gordon—Dream) out of Mist (Grant—Noll).

*Don*. By Mr. W. R. T. Vanderput, Pittsburg, Pa., for black and white (ticked) English setter bitch, whelped Nov. 17, 1892, by Dash III out of Bessie (Don—Davidson's Flora II).

*Trifle of the West*. By Mr. G. R. Nichols, New Haven, Conn., for black, white and tan pointer puppy by Count Nover out of Lala (Lala—Fanny).

*Pointing*. By Mr. D. H. Goodwin, Newburyport, Mass., for black, white and tan English setter bitch, once old, by Dash III, out of Juno (Lepus—Belle).

#### NAMES CHANGED.

See instructions at head of this column.  
*Don*. By Mr. W. R. T. Vanderput, Pittsburg, Pa., for black and white (ticked) English setter bitch, whelped July 1, 1891 (Splinter—Nora), owned by Mr. Lawrence Thompson, New York.

*Shanghai*. By Mr. W. R. T. Vanderput, Pittsburg, Pa., for black, white and tan pointer bitch, once old, by Dash III, out of Juno (Lepus—Belle).

See instructions at head of this column.  
*Pointing*. By Mr. D. H. Goodwin, Newburyport, Mass., for black, white and tan English setter bitch, once old, by Dash III, out of Juno (Lepus—Belle).

*Pointing*. By Mr. D. H. Goodwin, Newburyport, Mass., for black, white and tan English setter bitch, once old, by Dash III, out of Juno (Lepus—Belle).

*Pointing*. By Mr. D. H. Goodwin, Newburyport, Mass., for black, white and tan English setter bitch, once old, by Dash III, out of Juno (Lepus—Belle).

*Pointing*. By Mr. D. H. Goodwin, Newburyport, Mass., for black, white and tan English setter bitch, once old, by Dash III, out of Juno (Lepus—Belle).

*Pointing*. By Mr. D. H. Goodwin, Newburyport, Mass., for black, white and tan English setter bitch, once old, by Dash III, out of Juno (Lepus—Belle).

*Pointing*. By Mr. D. H. Goodwin, Newburyport, Mass., for black, white and tan English setter bitch, once old, by Dash III, out of Juno (Lepus—Belle).

*Pointing*. By Mr. D. H. Goodwin, Newburyport, Mass., for black, white and tan English setter bitch, once old, by Dash III, out of Juno (Lepus—Belle).

*Pointing*. By Mr. D. H. Goodwin, Newburyport, Mass., for black, white and tan English setter bitch, once old, by Dash III, out of Juno (Lepus—Belle).

*Pointing*. By Mr. D. H. Goodwin, Newburyport, Mass., for black, white and tan English setter bitch, once old, by Dash III, out of Juno (Lepus—Belle).

*Pointing*. By Mr. D. H. Goodwin, Newburyport, Mass., for black, white and tan English setter bitch, once old, by Dash III, out of Juno (Lepus—Belle).

*Pointing*. By Mr. D. H. Goodwin, Newburyport, Mass., for black, white and tan English setter bitch, once old, by Dash III, out of Juno (Lepus—Belle).

The birds were a lot of tame ones, and while they did very well for such stock, and were not disappointingly sluggish, yet they were very far from being up to the grade of good, swift-flying wild birds,

#### THE COLT DISC ENGINE FOR YACHTS.

THE introduction of steam as an element in yachting has within the past few years added a new chapter to this instructive and exhilarating sport, and has been the means of bringing out a vast amount of enterprising ingenuity and a great deal of friendly rivalry among yachting men, some of whom have carried the spirit of emulation so far as to build a new steamer every season, or nearly so, with the object of beating former records as to speed and eclipsing all rivals. Of course a great deal of the enterprise thus displayed has been entirely misplaced, owing to the want of practical knowledge on the part of these amateur marine architects; but, on the other hand, a great deal of valuable data has been obtained from these numerous experiments by men of sufficient means to carry out their hobbies, and this has been fully taken advantage of by those who make a business of building steamers and marine engines.

Steam yachts may be roughly divided into three classes, namely: Racing Machines, or boats constructed without regard for any other consideration except speed, such boats, indeed, having but little claim to the title of yacht, which, strictly speaking, implies a pleasure boat; Steam Yachts proper, or steamers constructed with a due regard for all the conditions necessary in a pleasure boat, namely, comfort, safety, elegance and reasonable speed; and Combined Steam and Sailing Yachts, in which both canvas and steam power are available, and in which in some instances the steam power is only considered as auxiliary.

The first-mentioned class will always find some advocates in a country where the almost universal motto is "Go ahead," and a brief allusion to them is, therefore, not out of place.

Allowing for the comparatively small advantages or disadvantages due to more or less perfect models, the speed of a boat may be said to depend upon the relation of the available power to the displacement or weight of the boat and its contents. Thus in order to obtain increased speed, either the weight of both hull and machinery must be reduced or the capacity of boiler and engine increased,

# FOREST AND STREAM.

A WEEKLY JOURNAL OF THE ROD AND GUN.

TERMS, \$4 A YEAR, 10 CTS. A COPY.  
SIX MONTHS, \$2.

NEW YORK, MARCH 8, 1883.

VOL. XX.—No. 6.  
Nos. 39 & 40 PARK ROW, NEW YORK.

## CORRESPONDENCE.

THE FOREST AND STREAM is the recognized medium of entertainment, instruction and information between American sportsmen. Communications upon the subjects to which its pages are devoted are respectfully invited. Anonymous communications will not be regarded. No name will be published except with writer's consent. The Editors are not responsible for the views of correspondents.

## SUBSCRIPTIONS.

May begin at any time. Subscription price, \$4 per year; \$2 for six months; to a club of three annual subscribers, three copies for \$10; five copies for \$16. Remit by registered letter, money-order, or draft, payable to the Forest and Stream Publishing Company. The paper may be obtained of newsdealers throughout the United States and Canada. On sale by the American Exchange, 449 Strand, W. C. London, England. Subscription agents for Great Britain—Messrs. Sampson Low, Marston, Searle and Hingston, 188 Fleet Street, London.

## ADVERTISEMENTS.

Only advertisements of an approved character inserted. Inside pages, nonpareil type, 25 cents per line. Special rates for three, six and twelve months. Reading notices \$1.00 per line. Eight words to the line, twelve lines to one inch. Advertisements should be sent in by the Saturday previous to issue in which they are to be inserted. Transient advertisements must invariably be accompanied by the money or they will not be inserted.

Address all communications, Forest and Stream Publishing Co., Nos. 39 and 40 PARK ROW, NEW YORK CITY.

ANSWERS TO CORRESPONDENTS.

## MR. VEST'S VICTORY.

THURSDAY last in the United States Senate was devoted in part to a discussion of the Sundry Civil Appropriation Bill. Among the amendments to this bill which were passed by the Senate were a number relating to the Yellowstone Park, by which it is for the present efficiently protected from the greed of the body of men who have so earnestly striven to wrest it from the people of this country and turn it into a speculation with which to line their own pockets. The bill as amended and as passed by both houses of Congress contains the following provisions:

"For the protection and improvement of the Yellowstone National Park: For every purpose and object necessary for the protection, preservation, and improvement of the Yellowstone National Park, including compensation of superintendents and employees, \$40,000, \$2,000 of said amount to be paid annually to a superintendent of said Park, and \$900 annually to each of ten assistants, all of whom shall be appointed by the Secretary of the Interior, and reside continuously in the Park, and whose duty it shall be to protect the game, timber, and objects of interest therein; the balance of the sum appropriated to be expended in the construction and improvement of suitable roads and bridges within said Park, under the supervision and direction of an engineer officer detailed by the Secretary of War for that purpose.

"The Secretary of the Interior may lease small portions of ground in the Park, not exceeding ten acres in extent for each tract, on which may be erected hotels and the necessary outbuildings, and for a period not exceeding ten years; but such lease shall not include any of the geysers or other objects of curiosity or interest in said Park, or exclude the public from the free and convenient approach thereto; or include any ground within one quarter of a mile of any of the geysers or of the Yellowstone Falls, nor shall there be leased more than ten acres to any one person or corporation; nor shall any hotel or other buildings be erected within the Park until such lease shall be executed by the Secretary of the Interior, and all contracts, agreements, or exclusive privileges heretofore made or given in regard to said Park, or any part thereof, are hereby declared to be invalid; nor shall the Secretary of the Interior, in any lease which he may make and execute, grant any exclusive privileges within said Park, except upon the ground leased.

"The Secretary of War, upon the request of the Secretary of the Interior, is hereby authorized and directed to make the necessary details of troops to prevent trespassers or intruders from entering the Park for the purpose of destroying the game or objects of curiosity therein, or for any other purpose prohibited by law, and to remove such persons from the Park if found therein."

These provisions appear to give ample assurance that the people are to be allowed to possess their pleasure ground in peace, and are not to be passed over to the tender mercies of the corporation, which, with a shrinking modesty that has rarely been equalled, attempted to seize for its own benefit about two and one quarter millions of acres of the domain of the United States. If they did not succeed in accomplishing their object it was not for want of energy, shrewdness, money, nor powerful backing. Some of the sharpest intellects, some of the best business ability in the country, worked for them; they had unlimited money with which to influence legislation; they had an enormous political power behind them. Senators and ex-Senators, men whose names are known to every voter, nay to almost every woman and child, throughout the country, did not hesitate to lobby for the success of this project, to speak for it in the halls of Congress, to use every influence, personal and political, to further it. The press of the country, with a few exceptions, was on the side of the jobbers, and they used it in such ways as they pleased. Captured by a shallow device, which we long ago exposed, the newspapers lent themselves to this scheme, and became the willing tools of the ring. There were some notable exceptions to this rule, but it was none the less the rule. With all this in their favor the question may well be asked, "Why did they not succeed in their plans?" The answer can readily be given by one who has watched the fight from its inception. They failed because Senator George G. Vest, of Missouri, occupies a seat in the Senate of these United States. Therefore every citizen owes to this gentleman warm thanks.

No one who is not thoroughly familiar with Washington and the methods of the lobbyist can at all conceive the difficulties against which he had to contend. The opposition which he had to meet in his patriotic efforts to protect the people came from all sides. The politicians, the press, the

lobby, and a considerable number of his colleagues were all against him. Only the people were on his side. He persevered, and in the face of every opposition succeeded in carrying through the measures above cited. We congratulate the Senator on his victory.

It is a matter of regret that the bill which provided for the extension of the limits of the Park could not have been passed during the present session of Congress, but we trust that at the next steps may be taken, in time, to set aside from settlement a considerable additional tract of territory on the south and east of the present Park.

In his effort to save the Park, Senator Vest has received efficient aid from Mr. Harrison, of Indiana, a gentleman who last summer visited the Park, and was thus able to speak intelligently of its needs.

We print in another column the remarks of Mr. Ingalls, of Kansas, and Senator Vest's reply. Our readers can very clearly judge from these remarks just exactly how broad and liberal are the views of the Kansas Senator, and how intelligent an interest he takes in the important matter of the National Park. It was scarcely to have been supposed that in a body like the United States Senate any one could have been found to express such sentiments as those quoted, and from their tone we should imagine that the Senator was a kind of a Rip Van Winkle, only more so—a hundred years behind his age. Senator Vest's admirable reply seems to have left Mr. Ingalls nothing to say.

The time will soon come, even if it is not already here, when the Yellowstone Park will be cheap to this nation at a million dollars a year. The piracy policy of saving a few dollars now, and by that means losing in the future something that it will be then wholly out of our power to regain, cannot be too strongly condemned. The Park is at present all our own. How would our readers like to see it become a second Niagara—a place where one goes only to be fleeced, where patent medicine advertisements stare one in the face, and the beauties of nature have all been defiled by the greed of man?

It is the boast of the day that this is a practical age, and its motto seems to be, "Put money in thy purse." Get money; get it—honestly, if you can—but get it. Sacrifice everything to this hunger for lucre. Set Niagara to turning millwheels, build your manufactories over the geysers, for in them you have perpetual motion. Cut up your parks and sell them for farms or for building lots, as the case may be. The man whose pockets are to be filled will not say a word against the work of destruction.

The progress of this spirit must be checked; and for having interfered to save the Park from the monopolists, we thank you, Senator Vest.

## HUNTING WITHOUT A GUN.—III.

ALL seasons are good wherein to go hunting without a gun, but none better than when the arbutus is blooming or a little earlier, when of all flowers the liverleaf alone has raised its head above the mold. For then you are in duty bound not to hunt, it being close time for all game except wild ducks and geese and the persecuted snipe—and ought to be for them.

The trees are waking from their long sleep, showing it not only by the swelling buds that give a purple tinge to all the gray woods, but by a more living look in their trunks. Their old leaves, pressed flat by the snow, that so long has lain upon them, thickly cover the ground and will add a nail's thickness to the crust of the world.

Here and there on the brown carpet, are tufts of evergreen ferns, cushions of moss, blotches of the purple green leaves of hepatica and dots of its flowers. The sun shines down through the lattice of branches, and checks all with meshes of shadow.

The chipmunk and woodchuck have left the darkness of the under world and are out in the sun again. The birds that spend the year with us are here—jays, woodpeckers, titmice and nuthatches—all busy and noisy, and some of the migrants have come. A hawk is cruising high above the tree-tops, his broad sails golden brown in the sunlight, and a black guard of crows are challenging a fox in his own woods, or an owl in the tree, that has been his home these ten years. A peewee makes sudden flights from her perch and back, gathering an insect in every airy loop. A bluebird carols in a tree-top against a sky as blue as his back, and a flock of slate-colored snowbirds are thridding a thicket, and filling it with their light warble and sharp metallic chip, like the clinking of castanets. They are not snowbirds with us, for they go further southward when the first snow comes, and are by no means the earliest spring comers.

year-olds, \$6.50 for three-year-olds, and \$8 for four-year-olds and upward, extra heavy ones sometime bringing \$10 per head.

Generally one or two young men, sons of the former owners of the cattle, would go along with the herd to assist in driving, and at the same time look after the interests of their friends and neighbors, and if the dealer should decide not to return immediately to the same neighborhood, they would disappear, and the herd, thus being alone, would receive the purchase money due to their friends at home, having been previously authorized by power of attorney to do so.

These droves or herds numbered from a thousand to twenty-five hundred head, rarely exceeding the latter figure, and it would require four men for the first five hundred head, and a man for each hundred after. In addition to these men there would be needed one pilot to lead the herd, and select camping grounds, etc. One cook, a teamster to drive the heavy canvas-covered wagons drawn by five or six yoke of oxen, containing the cook and camp equipages, and two men to drive and attend to the spare saddle horses, of which there would be needed three or four for each vaquero.

The trip to Kansas used to occupy from sixty to eighty days, driving ten or twelve miles a day, but stopping over occasionally for three or four days, to rest the cattle where they found good camping and grazing ground, and also being delayed sometime for a week at a time gathering together the cattle after a stampede.

The wages paid these vaqueros, or cowboys, as they are now called, was sixty to eighty dollars per month, with arms and everything furnished, and one month's pay in addition and allowed to them for their expenses on the return trip to their homes in Texas.

A trip up the trail with a herd was always accompanied by great hardships and many startling incidents. Starting as they did in the spring of the year, when every stream was swollen, they had to swim the Brazos, Colorado, Trinity, Red River, and the Wichita and Arkansas rivers, beside many smaller streams, all with swift-flowing currents and changing quicksands.

I have seen sixty steers bogged down in the quicksands of the Red River at one time, and yet, owing to the indefatigable exertions made by all hands, we only lost eleven head by being either smothered or drowned. The cowboys would dig down in the quicksand with their fingers until they could pass a lariat under the animal's fetlock joints, and so, pulling one leg out at a time, release the herd. Then, over and over like a barrel until they reached terra firma, when they would immediately rise to their feet and, after shaking their heads awhile, come charging on their rescuers.

To get their wagons and camp equipage across these swollen streams, they would construct a raft from the dead timber found along the banks, and then six or eight vaqueros would attach one end of their lariats to it and the other to the horns of their saddles, and so causing their ponies to swim, tow the raft and wagon across.

Then there were the stampedes, on dark and stormy nights generally, accompanied by loud peeling thunder and vivid streaks of lightning, when the cattle would suddenly start up as with one impulse, and run for miles, the earth literally trembling under the heavy tramp of the moving mass, which nothing could stop until they ran themselves down. I knew of one instance of a cowboy who, on such a night, jumped on his pony without either saddle or bridle, and with no clothes on but his shirt and drawers, and bare-headed, ran with a stampeded herd a distance of thirteen miles, until he succeeded in stopping a bunch of eighty-five head which had become separated from the main herd, and being unable to drive them back to the camp, held them until three o'clock next day, when some of the other hands came to his assistance. He had herded this bunch bare-headed under a broiling sun all day, and on foot, as his horse had been completely run down during the night.

The Cross Timbers, situated between the Brazos and Trinity rivers, was invaded by a gang of desperadoes and cattle thieves at this time, who resorted to all sort of schemes to stampede the herds as they passed through that country; they would then fall in behind a bunch of the stampeded cattle and run them off a long distance into some brushy creek bottom, where they would keep them in hiding until the balance of the herd had been gathered together and moved on. They would then kill the cattle they had thus stolen for the sake of the hides and tallow, which they would sell in the nearest town.

I recall a case in which one of these cattle thieves was caught by a cowboy on guard in the act of tying a flinted raw hide to the tail of a milch cow, which he had driven up to the outskirts of the herd for that purpose. If he had succeeded, the rattling of the dry hide would have frightened the cow and caused her to run, and the faster she ran the more noise the rattling hide would have made, and this stampeded the herd. The boys gave this fellow a short shrift, and the next day the boss of the herd rode in to the neighboring town of Hillsboro and reported that the body of a man had been found near his camp with three bullets in his heart and several holes in other portions of the body; at the same time he related the capture that his men had made the previous night, adding, "of course he got away." I believe some of the citizens went out and buried the fellow, but there was no sort of judicial inquiry made as to the manner or cause of his death, and the matter was understood.

The Chickasaw Indians, Pawnees and other Indians through whom the herds had to pass, also harassed them and stole their cattle and saddle horses, and battles between parties of cowboys and these Indians, in which many of both sides would be killed and wounded, were of frequent occurrence.

After they arrived in Kansas, if the owner concluded to winter his cattle below putting them on the market, the cowboys would have no easy time of it. Living in a hole dug out from the side of some hill, with probably a buffalo robe or two to keep them from the cold ground, riding twenty-five or thirty miles in all sorts of weather daily, often being away from camp all night after a bunch of stray cattle, when they would have to seek some ravine or hollow where they could find a little rest, and then sit there all night to keep from freezing to death, for a cowboy would suffer untold privations before he would return to camp and report a failure to bring back any cattle he had started after and endure the jeers and derision to which he would be subjected at the hands of his fellows.

Taking it all in all, the cowboy of those days was not so bad as he has been painted. Quick with his pistol to resist a fancied injury, just as ready to fight for his rights as his employer, though he kept from personal interest in the quarrel; generous and open-hearted. His word was his bond in

everything but swamping horses. Faithful in the discharge of his onerous duties, his chief fault was his love of strong drink and gambling; under the influence of the former he would become a perfect demon. Abilene, Elsworth, Wichita, and other Kansas towns at which they used to arrive from their long, hard trips up the trail, were full of gambling dens, rum shops, and dance-houses of the lowest description, kept principally by Northern men and women for the purpose of prevailing upon these unsophisticated semi-barbarians. Is it any wonder then that they should become the desperadoes and terrorists to society they have, when such snares and pitfalls have been laid for them and temptations thrown in their way?

The profits in the Texas cattle trade were very large, but the risks to be run were also great. With fair luck a herd could be driven from Texas to Kansas and wintered there for \$2.50 per head, with a loss of five per cent. of the cattle on the trail and from five to eight per cent. extra loss during the winter. With a hard, wet trip and many stampedes the loss would be much greater, and in wintering there was always the chance of trouble with the Indians or being burned out by the Kansas jayhawkers, when the probabilities were that the owner would lose everything, and come out on foot in the ensuing spring, as once happened to the writer of this article.

#### A LONGING FOR SPRING.

( ) WOULD I could sing:

"The winter over,

The breath of the spring

Is rippling the clover;

Daisies and daffodils

Languish, I ween,

In the valleys and the hills

Are 'waxen' the green."

O would I could hear

"The voice of the turtle"

At even, so clear

Afar in the myrtle!

Often I listen,

Yet listen in vain I—

Bound fast in prison

Of frost doth the earth lie.

O would I could tread

The path of the past-time,

Where leaves, lying dead,

Are crooning a sad rhyme.

Over hill and through dale

Long I to roam.

Now watching the cloud-sails,

And on the bee's foam.

O would I could climb,

As erst, the bold mountain.

Could look on the rim

Of sky-fostered fountain.

Leap like the anemone,

From crest to crest.

And see the far spaces open,

To the eastward and west.

O would I could throw

My crafty creation

Where the swift waters flow.

In sweet expectation

To see the fish take it!

Ah me and ah me!

I anticipate it

So heartily!

Those longings will come

On days such as this

When winter seems dumb

To the rills in the ridges.

Oh, do the buds and bees

Think it is spring!

Long to path forth on trees,

Blithely to sing!

O. W. R.

### Natural History.

#### THE BIRDS OF MAINE.

With Annotations of their Comparative Abundance, Dates of Migration, Breeding Habits, etc.

By EVERETT SMITH

FAMILY ARDEIDÆ: HERONS.

206. Great Blue Heron—*Ardea herodias* Aud.; Ridg. 487, Cs. 655.—Common throughout the State. Arrives late of March and early in April. Breeds on trees; lays three or more bluish green eggs in June. Remains until late in the autumn. I saw one at Scarborough December 25, 1877, a remarkably late date for the species to be here.

207. Great White Egret—*Ardea candidissima* Aud.; *Herodias alba egretta* Ridg. 489; *herodias egretta* Cs. 658.—A rare straggler from the South. The late Caleb G. Loring, Jr., shot a specimen at Scarborough, Maine, August 22, 1853. I saw a freshly killed specimen that was shot at Scarborough in April, 1875, and this was mounted by Mr. Willey, a taxidermist, then of Portland, Me. Mr. Boardman obtained a specimen, shot at the Bay of Fundy, in August, 1879.

208. Little White Egret, Snowy Heron—*Ardea candidissima* Aud.; *Garzetta candidissima* Ridg. 490, Cs. 659.—A rare straggler from the South. Mr. Boardman informed me that he has procured two specimens, which were shot in the vicinity of the St. Croix River.

209. Little Blue Heron—*Ardea herodias* Aud.; *Florida herodias* Ridg. 493, Cs. 662.—A rare straggler from the South, and but a single instance of its occurrence here has been reported.

While at Scarborough, during the latter part of May and early in June 1881, I learned that a white heron had been seen there by several persons. I offered a reward for the capture of this specimen, and various local gunners sought for it.

The bird passed the summer in the vicinity where first seen, and in September was shot by Mr. L. W. Pillsbury, a well-known gunner of Scarborough, in company with Mr. Charles H. Chandler, of Cambridge, Mass. The skin of this bird is preserved and in the possession of the latter gentleman.

My friend Nathan Clifford Brown, informs me that the specimen has been viewed and identified by Mr. H. A. Pur-

die as of the species above named, in the white phase of plumage peculiar to the birds of this species of less than three years of age.

210. Green Heron—*Ardea virescens* Aud.; *Butorides virescens* Ridg. 494, Cs. 663.—Common. Not abundant. Breeds on trees, lays three or more pale green eggs, in June. The little herons of this species appear now to be less common in Maine than formerly. I have never known them to be associated together in communities here, nor observed a greater number than the members of one family together.

211. Night Heron—*Ardea nycticorax* Aud.; *Nycticorax grisea* Ridg. 495; *Nycticorax grisea nivalis* Cs. 664.—Abundant; gregarious. Arrives in April. Breeds in colonies upon coniferous trees, usually preferring spruce swamps. Lays from three to five blue-green eggs in May and June. This bird is locally termed "stake," on account of its cry, and by an imitation of this cry the bird may be easily decoyed.

212. Bittern—*Ardea lentiginosa* Aud.; *Butorides lentiginosa* Ridg. 497; *Butorides nunguis* Cs. 666.—Abundant. Arrives early in May. Breeds on the ground, Lays five eggs in June. Locally known as "stake-driver," "meadow-hen," "mud-pie," etc.

Audubon wrote that he "never had a good opportunity of observing all the habits of this remarkable bird, which in many respects differs from most other herons."

Dr. Coues, after alluding to the vagueness and paucity of the information on the subject that has been given by Wilson, Nuttall, Richardson, and other ornithologists, says of his own experience, "Although I have seen many of the birds, I have never seen its nest, nor found it where I could suppose it was breeding."

The facts that the standard works on American ornithology give but little of this bird's life history, and the bird is often locally confounded with the night-heron, whose habits are quite different, induce me to repeat in this connection some of my own observations derived from many frequent opportunities for studying of the bittern in various localities, in New Hampshire, Maine, New Brunswick and Nova Scotia, at all seasons of the considerable portion of the year spent by the species in the regions named.

I first saw the nest of a bittern in 1863. While shooting at Scarborough, in the summer of 1862, upon what is termed the "upper marsh," Mr. Manson Libby, a native resident of that vicinity, saw, and informed me, and informed me, it was one of his family bred close by. At that time I was giving especial attention to oology and the nidification of birds, and immediately obtained a promise from Mr. Libby to observe if any bitterns returned to breed there the following spring, and inform me. This he did, but not until so late in the season that I failed to secure the eggs, which were hatched ere I could avail myself of an opportunity to visit this nest was of grass, and on the ground near the head of a little meadow communicating with the marsh. I have never known of the nest of a bittern elsewhere than on the ground, and although usually placed in close proximity to suitable feeding grounds, they are frequently located among the bushes and small growth to be found at the borders or in the midst of meadows. I have not so frequently found bitterns in covert, both in the breeding season and later, but I have never known one to alight on a tree except when wounded.

Until within a dozen years quite a number of pairs annually bred at the marshes of Scarborough, Maine, and a few pairs still breed there. These marshes are on the coast from six to ten miles westerly from the city of Portland, and are familiar with the haunts and habits. I found two families there so recently as 1877, and leaving them undisturbed until October, I then gathered in seven of them.

I once watched, at every opportunity (which occurred at least once in each week), the arrival and courtship of a pair that bred on a meadow in the town of Madison, New Hampshire. Every morning through the month of May could be heard those curious cries never heard by a woman, and to which during the spring, for which the farmers name them "stake-drivers."

The cries of but few birds can be expressed or imitated by words, but the syllables "pump-aug-aug," with a strong accent on the terminal "ga," are to my mind the best verbal expression of the bittern's cry that I have seen written. If a stake be placed between wooden buildings and driven into the ground by blows with a wooden maul, to one standing at a distance, or leaning the sheet of which immediately followed by its reverberatory echo from the buildings, the sound will seem a good imitation of the "stake-driver's" cries. So like unto these are these cries at times that I once knew a trout fisherman to drop his rod on the bank of a stream to seek information in regard to the locality from a "stake-driver" that he mistook to be some person building a fence.

These cries are sometimes given irregularly with long or short pauses between, and at other times the cries will be repeated regularly, perhaps slowly at first and gradually increasing in rapidity of repetition, after the manner of the whip-poor-will.

Although diurnal in its habits the bird is of a retiring nature, and I have known of many farmers who were perfectly familiar with the cry of the "stake-driver," but knew not whether it emanated from bird, beast or reptile, some expressing the belief that the cry was produced by a peculiar sort of frog, others that it was made by a little bird that always kept secreted in the dense grass, reeds or bushes.

The only cry that I have heard from the bittern in autumn is a guttural croak given when alarmed, and this cry resembles that given by various herons and other similar ground-stauncs. It is even of course, the cry or screams of a wounded bird, which are unnatural.

My profession as civil engineer located me for two years at Machias, Me., in charge of river improvements, and while there I watched with great interest the courtship of a pair of bitterns, and the subsequent rearing of a large family of five children. Almost daily from June until the first of August I saw these birds, as they frequented a bit of marsh on the west shore of the "Kovaskisscook," or Machias River, immediately adjoining the portion of the river on which the work was being prosecuted. Their nest was located on the border of a meadow through which the Marshfield stream flows, and was within a mile of the bit of marsh resorted to as a feeding place. Here the tide ebbed and flowed, but the water was only brackish, and tide-eaten creeks and "pools" of the marsh afforded an inexhaustible supply of food to the bitterns, as also to two families of kingfishers, reared near by, while a pair of ospreys procured an easy living from the river. When the five young bitterns could fly they followed their parents twice daily to this feeding place. After feeding in the morning they would return to the seclusion and solitude of the bushes in the vicinity of the nest, and about four

o'clock P. M. come back and feed until sundown, when all again returned home for the night. After a while, however, some of them would remain all day on the marsh, especially on cloudy or cool days. But when the weather was very hot they would again seek the shade for the middle portion of the day.

Oftentimes when they came to the marsh at high tide I would mark them down, and quietly approaching in my boat the one most accessible, watch its movements unobserved. When suspicious of danger or slightly alarmed the bird, if not taking flight, would remain all day on the marsh, especially on cloudy or cool days. But when the weather was very hot they would again seek the shade for the middle portion of the day.

have record was a single specimen shot near Fort Popham, in the month of the Kennebec River, early in September, 1881.

Like the common bittern, which it somewhat resembles in plumage and much in form, although so diminutive, the least bittern nests upon the ground, laying its four or five eggs in June. The young are well able to fly and take care of themselves early in August, although the parents, both male and female, still remain with them at that time and continue a fostering care. I once watched a family of seven during July and August. Their daily noonday retreat was the gunwale of an unused boat anchored in a small cove, and while perched there would permit me to swim within a few yards without showing fear or being at all disturbed.

The habits of this species much resemble those of the greater bittern. They are very gentle, are diurnal and nocturnal, nest upon the ground, do not associate in colonies, and I have never seen one alight upon a tree, although not infrequently I have observed them upon the large stalks of marsh hay, where they were industriously seeking and devouring insects. I have also observed the little green heron thus engaged.

[TO BE CONTINUED.]

### THOSE MARINE MONSTERS.

OUR notes on the strange marine monsters, loosely called "sea serpents," continue to accumulate, and we are not without hopes that from this discussion may arise some facts which shall be of permanent value to science.

We owe to the kindness of Prof. Spencer F. Baird, U. S. Commissioner of Fish and Fisheries, the opportunity to print the two letters given below. Our readers will remember Captain Platt's account of his own observations published in a recent issue of FOREST AND STREAM, and those appearances to Captain Howes adds most interesting details concerning the creatures seen at different times in almost the same locality. The letters explain themselves:

U. S. NITRE DEPOT, MALDEN, MASS. }  
February 17, 1883.

Professor Spencer F. Baird, U. S. Commissioner, Fish and Fisheries, Washington, D. C.:

DEAR SIR—I take great pleasure in inclosing a thoroughly reliable account of the sea serpent seen by Captain Frank M. Howes in 1875 in almost the same place that I saw the one that I reported. Captain H.'s account is better than

mine, from the fact that he was nearer and saw its head and mouth; but the fin and its manner of holding its head was pretty much as what I saw. You will see by Captain H.'s letter that he made a note of seeing these creatures in the ship's log. I think now you can say safely that these creatures are sea serpents, and I believe that they are often seen, but those seeing them feel that they would only be ridiculed by reporting them.

ROBERT PLATT.

BALTIMORE, Feb. 13, 1883.

Robert Platt, Master, U. S. N.:

MY DEAR CAPTAIN—At last I have found my log-book which had the sketch of the "sea serpents," which I saw on the 12th of August, 1875. The sketch I made immediately after seeing them. A cut taken from my sketch was published in the Boston Globe of August 14, 1875. I saw three of them: two large and one small one. All the family were out that day. They were a different animal from any I ever saw before, and I have been around the Horn into the Pacific twice. I inclose a rough sketch. I shall never

forget how they appeared, but I wanted to find my time-book, thinking that I had made some memorandum which would give the particulars more fully than I might remember. The large ones showed about fifteen feet of their length, and carried their heads about six feet from the water. I estimated that through the head they measured from twelve to fifteen inches, and grew gradually larger until at the water line they were, I should say, about two feet six inches to three feet in diameter. They were going quite fast in an opposite direction. We were about two miles from Cape Cod Light, by the way. They looked remarkably like a snake. The head was flat, and when they were right abreast about 250 to 300 feet away, the small one came up head on to us. I had my glasses right on them at the time, and I noticed under the jaw it was perfectly flat, and there was a sort of rim formed by the mouth and lips, such as snakes and frogs usually have. When they came up the body was at an angle to the water of about fifteen to twenty degrees or perhaps more. On their backs was a long slender fin projecting forward at an angle of twenty degrees from themselves, and I should think it was five or six feet long. It would oscillate or vibrate very perceptibly. The upper half of the body was a dark slate color, shading to a cream color on the under part. Another thing I

remarked: they did not curve down when they disappeared, but actually sank. Taking it altogether I think there is no doubt but that they were "sea serpents," judging from appearances—and I am no Polonius. A number of my officers and passengers saw them; and one of the captains of the Philadelphia and Boston steamer which passed Cape Cod a short time ahead of me went close alongside of them, and his description, as told me by a friend, tallied with mine.

This is about the thing. I hope Professor Baird won't say as Judge Bond did: "That I must have had 'em awful bad to have seen three."

FRANK M. HOWES.

The explanation of a supposed monster by "C." is interesting, but it is not to be supposed that all or any considerable portion of the trustworthy and credible individuals who have reported that they have seen these animals should have been deceived, as was the ancient mariner, whom our correspondent quotes. He says:

Editor Forest and Stream:

I was quite interested in Dr. Ayre's article on the sea serpent, and chanced to be in the company, a short time afterward, of Mr. Alexander Renney, an old seafaring man, who is perfectly reliable for all he may say. We were conversing on various adventures of his, until finally he said he had seen these serpents, and I was all attention at once. At my request he gave the following account of it. He said:

"About forty-five years ago I was with Capt. John Luce, engaged in coasting. Just at that time the New London papers were full of accounts of one being seen off the east end of Long Island, and we had just been reading about it. We were coming through the Sound, and had scarcely any wind, but there was a sort of steamboat roll on. When we were about opposite New Haven we saw, distant about a half mile or so, what we had just been reading about—the sea serpent. His head was pretty well out of the water, his tail lost underneath it; the humps corresponded exactly with the description, there being eight or ten of them. It was apparently swimming in the same direction we were going. After viewing it for quite a while, Capt. Luce said he was going to have a closer look at it, lowered the yawl and said to me, 'Will you go with me?' I did not like to refuse after the captain said he was going, so I told him I would go with him. We had a good pair of oars, and started for the creature. As we neared him we saw the monster more plainly, and stopped and looked at, and he seemed an ugly-looking fellow. We now turned the boat and backed toward him very slowly, all the time ready to bend on the oars for our vessel, in case he put for us. We finally got quite close and stopped, and then, after a while, we made him out. Now what do you think he was?"

I guessed the serpent, of course. "No," "Seaweed, then?" "No," "Well, what was it?" "A water fence of about eight or ten lengths tied together with gravestones. Seaweed had collected at the joints, and gave the appearance of humps at a little distance off. The head or high part was the shore end, and the other had been under the water so long it had become heavy and scarcely floated."

Mr. Renney says he has no doubt that this was the sea serpent seen off New London, the wind and tide bringing it in the Sound. I confess I felt disappointed at the finale, and almost wished they had not gone quite so close to it. If the above will be the means of hearing more of the serpent, it will be interesting to

WALTON RIVER, Jan. 22.

In the Portland (Me.) Press of Jan. 27 appear the following item:

Capt. William Richardson, of the fishing schooner Village Maid, was on a recent trip, when about six miles off Cape Elizabeth, the two lights bearing northwest, had his attention called to a monster by Herbert Elliot. Whatever it was it was disturbing the crew, and when one of the crew, who was on the vessel, the monster raised its head twelve feet out of the water in a perpendicular position, with its head bent forward at right angles to its body; it appeared to be two feet in diameter, with black, shining scales. The water was lashed into foam as it disappeared under the sea with a long, sweeping motion. It continued to rise at short intervals, presenting the same appearance until lost in the distance.

We have taken some pains to investigate this report; but the information received, while it adds something to the newspaper report, is not wholly satisfactory, being somewhat meagre in its details. One correspondent, who was requested by us to investigate this matter, writes us as follows:

PORTLAND, Me., Feb. 19, 1883.

Editor Forest and Stream:

The sea monster reported as seen near Cape Elizabeth, Maine, in December, 1882, was observed by Wm. L. Richardson, of Ferry Village, Me., master of the fishing schooner Village Maid, and by Herbert Elliot, of same place and vessel. The vessel was drifting under mainsail with boom gaged out, with only the captain and cook aboard, the crew in dories a mile to windward, when the creature was first seen by Mr. Elliot, who exclaimed to Capt. Richardson, "Is that one of our dories to leeward?" The captain looked up on the bimble for a better view, and saw that the object, at first apparently lying quietly at the surface of the water, was a living creature, and the water could be seen to dash up about it as it moved.

Capt. Richardson says that it would have attracted no special attention in the summer season, when whales, sharks and other large creatures of the ocean abound on this coast, but that they are seldom seen here in winter.

This "sea serpent" when seen was about a quarter of a mile to leeward, and the time half-past three o'clock in the afternoon of a bright day; sea smooth, no swell, and breeze very light from the north; the vessel then being on the "White Head" fishing ground, about eight miles to the southward of Cape Elizabeth. While being watched the creature raised a part of itself above the water, appearing then to the observers to be about the size of a barrel or "latter," black and glistening in the sunlight, with its head "fully six feet above the surface of the water," and held horizontally at right angles to the erect part of the body seen. The body seemed larger near the water than at the head of the creature. Remaining thus raised for several seconds, the monster, with a curving motion, disappeared beneath the water and was seen no more. I have thought it possible that this "sea serpent" may be one of the enormous eel-like seals, astray from the coast of Labrador, but the observers are confident that it was quite a different creature. A late officer of the U. S. Navy collected a voluminous mass of evidence upon the subject of the sea serpent, much of it of great value, as showing conclusively the occurrence of some such strange monster along the coast of New England, but not yet captured nor accurately described. This manuscript evidence was in possession of the late and now deceased History Society, and destroyed by one of our unfortunate rivals.

EVERETT SMITH.

Rochester has such a fall, she need not apprehend any such fate as befell the capitals of Greece and Italy.

The advantages of this place for a shooting ground have long been appreciated. It was formerly the range on which the celebrated Billings rifle was tested, before being sent out to challenge the world for accuracy, and spread the repute of this city as a manufacturing center. Ages before the sound of a rifle was heard in the Genesee Valley there were shooters on this flat, for they have left evidence of their existence in numerous flint arrow-heads, of which I had a finely chipped specimen picked up on the field a few years ago.

The region appears to possess for wildfowl some of the attractions ascribed by Tom Moore to the Skeig Islands in the county Wexford, Ireland.

Islets, so freshly fair,  
That never hath bird come nigh them,  
But from his course thenceward,  
He hath been won down by them.

The place is only a short distance from the middle of the city and surrounded by dwellings and manufactories, but the river flows beside it and its water seems to attract the feathered tribe as a magnet does a needle.

I remember one occasion on which a flock of Canada geese, going south, lost their way or became demoralized in crossing the river at this spot, and after flying wildly about the mills swooped down in the river and seemed to collect their scattered senses from contact with its water, for in a short time they arose and went off hooking, leaving, however, one of their number behind to testify to the skill of Rochester wildfowling. When the weather is very cold a few winter ducks come into the rapids. I shot one of them from the west bank of the river one very cold day some time ago, and it fell on the ice on the east side. I was looking for a safe place to cross, when two men with guns rushed down the bank and made for the bird. As one of them picked it up the ice broke under him, and he was immersed to the shoulders—a clear case of poetic justice. One day last fall, as a party of us were shooting glass balls a plover dropped its head into the water of the river. The traps were deserted instantly, and the bird paid forfeit with its life for having thus ventured into the lion's mouth. At a recent ball shoot of the club the sport was varied by the presence of merganser amid the floating ice, and it too was brought to pot.

ROCHESTER, N. Y.

## SENATORIAL OPINIONS ON THE PARK.

WE give below the remarks made by Senator Ingalls, of Kansas, during the course of the discussion of those amendments to the sundry Civil Bill which relate to the Yellowstone National Park. These sentiments do not require much comment from us, and we leave our readers to form their own opinion on the matter. The reply of Senator Vest is worth reading, because it shows so intelligent an appreciation of the needs, present and future, of the American people. Let our readers compare the two speeches:

MR. INGALLS.

The best thing that the Government could do with the Yellowstone National Park is to survey it and sell it as other public lands are sold. I have no doubt there are great curiosities, spouting geysers, crimson cliffs, and inaccessible mountain summits within that domain; but these features are not peculiar to that portion of the country. I know of no greater reason why the Government should exercise exclusive dominion over the Yellowstone Park than why it should assume to exercise control over Pike's Park or the Garden of the Gods or the Falls of Niagara or the Mississippi River, or any other of the great natural features of this continent.

It is getting to be a good deal of an incubus, and it is very rapidly assuming troublesome and elephantine proportions. We are already engaged in a very good-sized wrangle and quarrel with our citizens, that time is being wasted by way of unauthorized leases, as alleged by the Secretary of the Interior. Ten thousand dollars has already been spent in laying out roads that nobody uses. Last year we appointed a superintendent at an expense of \$2,000, and this year the appropriations are \$40,000. There is to be a corps of assistants to stay there summer and winter to look after the spouting geysers; to see that patent medicines are not advertised on the cliffs; that time is being wasted, and that the noble game is not excluded from those preserves. If this thing continues and the engineers of the Government are to lay out a system of roads and bridges, it will not be five years before it will take a million dollars a year to run that Park.

I do not understand myself what the necessity is for the Government entering into the show business in the Yellowstone National Park. I should be very glad myself to see an amendment to this bill to authorize that portion of the public domain to be surveyed and sold, leaving it to private enterprise, which is the surest guarantee for proper protection for such objects of care as the great natural curiosities in that region. I believe they would be safer that way, and that the interest of the public would be better preserved that way, and we should have easier and better and surer access, and less encroaching demands upon the Treasury of the United States.

MR. VEST.

I do not think that this is exactly the time to discuss the question that the Senator from Kansas has brought to the attention of the Senate. I was not a member of the Senate when the dedicatory act was passed. I believe, if I am not mistaken, that the Senator from Kansas was. That was the time that he ought to have made the speech that he has delivered here to-night.

Very frank to say, however, that I thoroughly indorse the purpose for which the act of 1872 was enacted. I believe that this Park is necessary to the American people. The Senator speaks of cutting it up, or surveying it, or selling it. This mountain wilderness is absolutely without value unless it be for mineral purposes, and the minerals have not yet been discovered. If the Senator from Kansas thinks that the noble game that inhabit that region, which is fast being exterminated, should utterly disappear from this continent, he should destroy this Park. The last hope of the preservation of the bison, the buffalo, the moose and the elk upon the continent of North America exists in the preservation of that Park, and to such an extent that it will be a great preserve.

The Senator speaks as if this was some proposition *sub genere*, unknown before. France has such a park, Germany has such a park, England has her royal parks, and why should

not America have her republican park, free to the people of the States, with these great curiosities that exist nowhere else?

Mr. President, the great cause of this age and of the American people is its materialistic tendencies. Money, money, *argent, argent*, is the cry everywhere, until our people are held up already to the world as noted for nothing except the acquisition of money at the expense of all esthetic taste and of all love of nature and its great mysteries and wonders.

I am not ashamed to say that I shall vote to perpetuate this Park for the American people. I am not ashamed to say that I think its existence answers a great purpose in our national life. There should be to a nation that will have a hundred million or a hundred and fifty million people, a park like this as a great breathing-place for the national lungs, as a place to which every American citizen can resort instead of spending his money amid the Alps of Europe or wandering on the Eastern continent in search of the wonders of nature. This is the great wonderland of the world, and if Senators will take a little time to devote but an hour to reading as I have done lately the account in plain, unvarnished phrase, from men who have no artistic taste but who love nature, the description of the great wonders that exist here, I shall not be afraid that speeches like those of the Senator from Kansas will find suffrages in the Senate.

But the question now before us is whether we shall keep this Park free from enclosures. If the Senator hereafter proposes to survey it and cut it up and sell it, I shall be perfectly willing to discuss that question.

## GUINEA FOWL AS GAME.

Editor Forest and Stream:

I have seen the guinea fowl live in flocks among wheat stubble in the fields as closely as quail, not flushing until almost stepped on. They are kept around farm houses like chickens, but unlike them do not stay in the yard, but run around the woods all day, only coming back for their morning and evening meals. They roost in the trees at night, and in fact are almost wild. When wanted for the table they are generally hunted up in the woods and killed with a shotgun. They fly fast for a heavy bird—very much like a prairie chicken. Instead of flying in a bunch they string out in a line like geese or ducks. When flushed they utter their peculiar note several times very sharply until they are well on the wing, and then again as they rise. If the hunter can get on a line with the direction of their flight, he ought to get several at a shot, as they are strung out so.

Last fall, while on a quail-shooting trip in the country, I was asked at a farmhouse to kill some "guineas," as they were called, for dinner. They had been noticed some time before feeding in a large field on the edge of some woods; the field was covered with high grass, so they could not be seen. Keeping close to my dog, I took a little while to give signs that they were near, and pretty soon pointed. As I came up the "guineas" rose with a terrible cry directly away from me for the nearest piece of woods. They were all in a line, and as I fired the first barrel seven fell, and three came down to my second. This was more than half the flock. The rest I let go as I had already more than I wanted. Some of them were only wounded and had to be retrieved, but a double shot I think this one was very successful, as I had never before killed more than one at a time. If the guinea fowl is allowed to run wild and hunted a little, I see no reason why it should not make a very good game bird. Its flesh tastes good like one anyhow. A law for shooting them should be made very strict because they would sell for a good price, and on that account would be very much hunted for the market.

PHILADELPHIA, Pa.

## THE RECEPTION OF THE "SCREED."

SOME weeks ago I sent a "New Year's Screed" to your office, which was fairly rendered and might well be calculated to provoke returns. It was written hastily, not thoughtlessly, and I am sure it is a boulder. A little briery maybe; but, in the main, well right.

The returns have been encouraging. I do not stand alone by long odds. The "screed" has brought me dozens of letters, some of them six to eight pages in extent, all flattering and commendatory. The letters bear evidence of sportsmanship, fair play and culture. The adverse criticisms have been light. "Meat-Hawk" enters a mild protest against being thought of as a fool because he has several dogs that cost him over \$100 each. I did not say that; but I can't help thinking of the old adage, "A fool and his money," etc. The fair cost of raising and training a good business hunter, setter, pointer or bound never ought to be more than \$25. I have owned, raised and trained hunting dogs for more than fifty years. The highest price I ever got for a dog was \$30. This was for a pointer that stood a snipe, in a raw March wind, for thirty minutes by the watch, without a perceptible hitch or uneasy movement. I thought him well sold.

The bound has bothered me most. I can train and break three pointers, setters or cockers more easily than one eager bound. I have trained and broken the fiercest and gamiest bounds. But, alas, when they were trained to voice and whistle, their vim and *clan* were gone. They became "ridge dogs." They listened for signals and ran short races. They ran well for a little while and came back.

"Meat-Hawk" thinks I might call the man a fool who paid \$500 for an oil painting when he could buy a chromo for five cents. I dare say I should. I know something of this painting business. I think I can name a parvenu of New York who paid not \$500, but \$4,000 for an oil painting by an "old master," the same having been painted in Rome by a sharp young artist of Cincinnati and duly manipulated by a shrewd low dealer in Vienna. In 1870 I was shown in New York a painting of two rappers for which \$6,000 was paid by the owner, who would not have given six dollars for the originals. Is a "counterfeit presentment" then worth more than the original?

Recently I read a paragraph in a New York daily stating that a painting on a canvas eight inches by six had been sold for \$88,000. I did not dwell on the point, but I can't help thinking that with a canoe, hatchet and knapsack, that I can bring to the front a young American painter who, for \$100, will copy that picture so perfectly that not one man in ten can tell the difference between copy and original. Wherein is its value? And I do not "go back" on art or artists, Grand, humorous old Hogarth with your "Prospective," "March of the Guards" and "Election Scene," to me you are, like Burns, a constant source of consolation. I cannot

afford the originals, but the copies are good enough. "When the mountain streams are frozen and the norland winds are out" I get my little array of art to the front and amuse it for inspection and admiration. First, the Damascus barrels of the shotgun. The intricate and beautiful pattern is just as fine to me as a good oil painting. Then a card of trout and bass flies by the best makers; next a few of Prang's best chromes; one or two oil paintings; my best red; photos of friends, etc. One of the paintings represents a hemlock tree of perfect pyramidal form. Right in front of me as I write stand three hemlocks, perfect as nature made them. All so similar in form and the growth of thirty years. Now, first them by the naked eye or microscope. The painting is the dabb of a plasterer. The work of nature stands the test from minutest twig and leaf to the root—more and more beautiful the more fully it is developed.

As to the five-cent chromo ("Meat-Hawk's"), I do not see it. But the last Prang chromo, I endorse. I can give my wife and children the benefit of a good picture at a cheap price. They enjoy, and see it. "Toxix" pays his respects, and thinks I had better draw it a little finer—take the bow and arrow instead of the old muzzle-loader. He is well right. The suggestion is good. Now, let us have a law something like this: "From and after the first day of April, 1883, it shall be unlawful for any person to kill or have in possession any deer or part of a deer, killed by any device save only by the bow and arrow. Penalty, \$1,000 or imprisonment for 1,000 days. All collections of money to be paid to the informer on whose testimony conviction is attained."

Pass such a law and enforce it. Extend it to every bird and animal now recognized as game. I dare say they would vote for it, with a chance. It would develop a good deal of muscle and skill in archery, and some deer would still be slain. It is not so very long ago that they were killed in no other way.

As to the covert snar at the old muzzle loader, let me state a few provable facts. "Ben Gitchell," "Joel Uster," "Old Foster," "Jim Locke," "Jim Steele," "Eph Steele," and "Old Man Young," each killed from 1,000 to 2,000 deer with a single-barreled wheel-stocked flint-locked, long-barreled Lancaster rifle. Is that enough? Or would it have been better that they had the modern breech-loader?

"Capt. Dorsal Fin" gives me a lift. My dorsal fin is worn flat by the knapsack. But here's my doctor pectoral. Let him cut me off somewhere in the Adirondacks if he can, and dare.

A word as to the Yellowstone Park business. You, Senator Vest and the best intellect of the country have got on the matter heavily and earnestly. All have spoken well and heartily. *Cut-throat!* Mr. Rufus Hatch, *et alii*, etc., are going right along though nothing had happened to disturb their serene plans. Are they going to haw?

WELLSBORO, Pa., Feb. 26,

## SUMMER SHOOTING.

IT is proposed by the FOREST AND STREAM, and others of the shooting fraternity, to repeal all laws relating to summer shooting, and thus to sweep away forever privileges which many of us have esteemed and enjoyed, and which our fathers enjoyed before us.

There was a custom in Athens of old, whenever a law was about to be repealed, to appoint an advocate, to plead its cause as that of a defendant.

My object in this article is to call for the advocate who will make an effective plea for summer shooting, before this question shall be decided by the summer.

"Nothing is settled till it is settled right," and how shall we get at the merits of a case unless we hear "the other side."

CLARRY.

While waiting for the advocate I beg to submit a few thoughts to the reader.

You have noticed that it has become—shall I say fashionably—to denounce summer shooting. A few editors of the sporting press, and hawk-makers have passed the word, and "summer shooting," and certain self-appointed guardians of shooting interests in various parts of the country have caught it up and echoed it after them, till at length it is fabled to be "the thing" to cry down and snarl at any who favor the old ways in this matter. You have noticed also the supercilious and lordly way in which these persons design to touch the subject, assuming, as they do, that the question has been decided on its merits, and that all who dissent from them are disloyal to the guild—are indeed "masked pot-hunters," could they be uncovered.

Well, servants of man won't accomplish its end, Byron said, "Cervantes laughed Spain's chivalry away," but the poet's success lay in "the ripeness of the times" even more than in his matchless sarcasm. In order to clear the way for our conclusions, let us put down the things on which we are all agreed:

1. Game laws are dependent for their execution on the sporting public, on the men who use the rod and gun. No game constable can succeed so long as these are indifferent or hostile.

2. These laws must represent the average sentiment and convictions of the shooting public. They must be free from the suspicion of having been framed in the interests of a class. They must be just, and aim at "the greatest good of the greatest number."

3. They must vary in various States according to climate and topography. Uniformity is impossible.

4. They must be framed so as to protect the young. Full-grown birds alone are lawful game, and the fawns must be brought to maturity. The rights of the farmers must be respected.

There is no better way, perhaps, to get at the average sentiment of the sporting fraternity on this question of summer shooting than by an examination of the game laws of the country.

I have been looking at these laws with a view to classification, and with the following results: Of the several States and Territories of the United States—

15 permit quail shooting in summer, viz., 9 in September, 3 in August, and 1 in July.  
24 permit woodcock shooting in summer, viz., 13 in July, including New Jersey, Pennsylvania, Ohio, Delaware, Illinois; 7 in August, including Massachusetts, New York, New Hampshire, Michigan; and 4 in September, including Maine, Vermont, Rhode Island.  
23 permit ruffed grouse shooting in summer, viz., 1 in June, 7 in August, 15 in September, including New York, Massachusetts, Rhode Island, Vermont, Ohio, New Jersey.  
10 permit deer shooting in summer, viz., 4 in June, 1 in July, 7 in August, including Michigan, New York, North

# Sea and River Fishing.

To insure prompt attention, communications should be addressed to the Forest and Stream Publishing Co., and not to individuals, in whose absence from the office matters of importance are liable to delay.

Of course, the supreme business of the hour when hooked to a fish would be to land him, but even in the highest sources of the angler's pleasure would come the joy of the chase, the progress of the struggle, the eye was not occasionally relieved by these visions of beauty. No, it is not all of fishing to fish. If it were the angler would not be able to claim fellowship with the long line of poets, philosophers, divines and statesmen whose names, from the time of St. Peter to the present hour, have adorned its annals.—George Dawson, "Pleasures of Angling."

## POSITION AND WEIGHT.

I HAVE no fault to find with "Floridian's" reply in FOREST AND STREAM of Feb. 22, though the lofty air of injured innocence which he assumes is not warranted by the facts. I admit that the language I used in my article was strong and vigorous—it was intended to be so, for the provocation was great—but it had the merit of being at least plain and honest, and devoid of all vagueness or insinuation. I see no necessity at present to retract anything I have said, for I think it was fully justified by "Floridian's" articles.

Let us see. He stated, without any qualification or extenuation, that: (1) The custom of placing the reel in front of the hand on bait rods is an obsolete one. (2) The mode of casting the minnow *à la Henshall* is the same as used in heavy sea-fishing for striped bass weighing from twenty-five to fifty pounds. (3) Dr. Henshall and all Southern and Western anglers believe in an use of heavy tackle.

Now, if (1) is not a false hypothesis, and (2) a willful assumption, and (3) a gross misrepresentation, then I am ignorant of the true meaning of these words. And then when Mr. Jordan distinctly and explicitly stated that he used a pliant eight-ounce rod, a G line, and a Meek reel No. 2 for black bass weighing from five to ten pounds, and played them a half hour each, "Floridian" hopes that he will extend his work up to the point of using a Meek tackle and getting more sport. I leave it to the readers of FOREST AND STREAM to characterize this portion of "Floridian's" article.

Now, when "Floridian" apologizes for the above-mentioned statements relating to Mr. Jordan, "all Southern and Western anglers" and myself, my retraction of, and apology for, the trenchant language used will be in order, and it will be done with unaffected cheerfulness and sincerity.

An explanation is due to Mr. Jordan in regard to his use of "half-grown bream" for bait. His use of this large bait was exceptional, they being used on one occasion only—the one referred to in his articles. He wished to secure a large bass for a specimen. A fuller account of this will be found in FOREST AND STREAM of October 19, 1882, page 230. In this article he says: "I had all the time been using medium sized minnows or small perch, and could take all the bass I wanted up to five pounds, but the Captain kept telling me to use the half-grown bream, and even the grown ones, if I wanted to catch the big bass, so I concluded to act upon his plan, once." The small perch alluded to here were sunfish an inch or two long, and which were often the only bait we could get; and the medium-sized minnows were "top minnows" (*Zygopterus*) which rarely exceeded two and a half inches in length.

Nowhere in my book do I advise, mention or "tell of" casting an ounce-and-a-half minnow, and "Floridian" and I agree perfectly when he says: "It does not suit me to throw an ounce-and-a-half minnow at a black bass, with any kind of tackle."

"Floridian" says my book is "badly defaced with advertisements in the reading portion." I say that neither my publishers nor myself have received either fee or reward for any mention made of tackle manufacturers. I used their cuts and recommended their tackle whenever I could honestly do so, solely for the guidance and benefit of my readers. And as these cuts were especially designed to portray the special features of their tools and tackle, they were the very best ones I could have used. They were not inserted in the light of advertisements, but as illustrative of the implements of angling. He further says my book "will not rank high as an authority on bass fishing." I should certainly be much surprised that "Floridian" entertain any other opinion of it; but after all it is merely an opinion. And he says I make a long scientific distinction between the two species of black bass, but when I come to write of taking them they are all one. And that the stupid big-mouth appears to furnish me as much sport as the quick-fishing small-mouth. Exactly so, and eminently proper. To the naturalist there are two species; to the angler but one, so far as the mere matter of taking them is concerned, for the same ways and means are employed, and the two species respond in the same manner to said ways and means. In all matters pertaining to the taking of the species I use the general term black bass advisedly, for this reason.

My opinion that there is no difference in the game qualities of the two species where the inhabitant the same waters, all other things being equal, has yet to be successfully controverted. Before I had much experience with both species I held the same opinion that "Floridian" does now; and when he experiments to the same extent that I have in the matter he will arrive at the same conclusion that I did; and as conclusion is a good word in this connection, I eagerly embrace it and conclude.

One thing more, however, just to agree with "Floridian" whenever possible. He concludes his reply by saying that he "does not think the highest style of the art is *à la Henshall*." Granted; for I claim fly-fishing to be "the most legitimate, scientific and gentlemanly mode of angling." But I also claim that "next to fly-fishing, casting the minnow is the most artistic mode of angling for the black bass." J. A. HENSHALL.

CYNTHIANA, KY., FEBRUARY, 1883.

After all that has been said on the subject, I presume all anglers will suit their own tastes. As the fashion, whether it suits their convenience or not. We fishermen, you know, like to talk of the deeds done on the water, of the fish taken and the big ones not taken—the big ones are generally lost—got snagged on the bottom or somewhere else, gone in some mysterious way, the bungling of the fishes, or other remote

cause, not a word of censure on the little pet, or as a woman would express herself, the "little duck of a rod."

Of being very robust, barrel training the beam at one hundred and fifty-eight pounds, consequently lacking in muscular power, I am a great admirer of a light rod, six ounces being as light as I would dare risk in my hands. I like to use it on all convenient occasions, where I know the water and the size of the inhabitants that I am about to engage in mortal strife. If the water with its natives are unknown to me, it is more convenient to swing an eight or nine-ounce rod, for the sole reason that I go out for sport and recreation, not to be made sport of by the tiny little fishes.

Let us illustrate: Some few years ago striped bass in great numbers made an annual pilgrimage to our doors, it was one of the pleasures of our life to spend an hour, morning or evening, in their company. The six-ounce rod casting the bread (flies) upon the waters snaking out the fish, which would weigh from half a pound to one pound and a half each. We would often get two or three fish at one cast, and sometime get one of two or three pounds weight, which I could accommodate, although it was a sore trial to the joy forever.

One evening in the early part of September, 1874, I reached the briek, got my leader wet and rubbed down, and sent the flies dancing over the water. My trail fly was snatched, and as the hook was bedded in the lip of the fish, and, not liking the rest, it made a rush down stream. One hundred and fifty feet below where I stood the river took a sudden bend, and when I reached the turn the fish was one hundred yards down and toward the far shore, headed for the sound, while I, with a few turns of line on the reel, dared not put on another ounce of strain. The last straw was on the camel's back. One of two things was open to me, either to part company with the fish, or take to the water, and the latter course was chosen. No doubt the fish thought he had due sport, for after some rough usage which the fish thought a good joke, he tried to thoroughly soak his captive, and a new idea struck him. He turned in his tracks and faced up stream. Improving the opportunity, I made some line and returned to the shore, but, alas, he had hardly begun his sport, for heading for South Hadley, he soon had all the line, and was enjoying the sport of playing the angler through the strong current from one of the mills. I certainly was fun, by the time he had me, for the second time up to the armpits, he began to show signs of relenting, and wanted to come in and purley. My turn had now come and I soon had him under control, but not through any service the rod had rendered. The graceful curve was not there. There was a perceptible short bend above the hand, and from the bend out to the tip the rod was straight with the line, and when the fish, a fifteen-pound striped bass, came to the sand, my hand and arm were straight, and I was glad to stay in a reclining posture for some time, with all the consoling indulgence soaked out of pipe, tobacco, and matches. With the same tackle and a nine-ounce rod, that fish would have wiggled its way to my feet, and I would have remained dry shod and enjoyed all the sport.

Now let me tell you a short story for your own edification. Many years ago, when log cabins were the fashion, and neighborhoods few and far between, in the State of New York, a Scot and a Hollander were the nearest neighbors and made the time pass pleasantly by their families spending the Sundays together at either house. In early summer Hans, with his family, were spending the day at Sandy's house, and while the two cronies cracked ocken and ky, the two matrons prepared the mid-day meal, cracked eggs and praised the babies. The guide wife was preparing some lace, and was noticed to be making a great addition of sugar, vinegar and at dinner he could not be prevailed on to touch the salad. "No, no, mine good friend, me don't want him, you put sugar in him, make him sweet, you put vinegar in him, make him sour." Sandy tried to convince him that it was good, that it was a matter of taste. "No, no, mine good friend, you taste mit your tongue; sugar him sweet, vinegar him sour." After many ineffectual efforts to convince him, and in despair he said, "I will give up, I will give up, you see my wife there?" "Yaw, yaw." "Well, I don't know whether you could have married her or not, but the Lord knows I never could have married your wife." "Yaw, yaw, mine friend, dat ish goot, haw haw haw-haw." The moral of this is that one man's meat is another man's poison. I am wedded to Dr. Henshall's fancy.

A few words more on the position of the reel, and I have done. No doubt some of your readers will say Chalmers is an old fogey. Well, he is. I prefer being an old fogey, with something substantial to hold on to, than have a new-fangled, unreliable something to be a source of trouble. I have said that I am not very robust. I cannot hold an outstretched arm with a copper cent on the palm for any length of time. How, then, can I hold the rod out with the left hand and manipulate the reel with my right hand, and a nine-ounce fish tugging at the far end of the line? I have tried it and have seen it tried.

"Oh, and some power the giftie gie us  
To see ourselves as others see us,  
It wad free many a blam'd-free us,  
And foolish notion."

I have seen the flip of the rod oftener without a line above the water, and the rod in a couple of minutes, I have seen the corner of the face, the twisted body of the rod under the water with the reel behind the back, and the hand twisted round clutching for the crank, which could not be found. I have almost seen the unexpressed thought: but of course there was no thought of the position of the reel; it was that the consummate fish would not keep still. Mr. Jordan decidedly showed common sense in placing the reel above the hand. With the reel above the hand on any fish, I am better prepared to handle any or all kind of fish and fishing.

It is now fifty years since Mr. Jordan's fancy and I were wed, and we are this year celebrating our golden wedding. During that fifty years there has been but one jar in the happy union. When Miss Back-of-the-hand stepped on the stage with her allurements and apparently bewitching smiles, we forgot ourselves and deserted the old love for the new flirt for a short season. Soon tiring of the flirt, ere we was too late to repent, we turned to our old love, where sport and pleasure in its truest sense extended the hand of thrice welcome to THOMAS CHALMERS.

P. S.—This is as good as you please and is everybody's business. I have a light rod mounted for the reel behind the hand; it is kept only for show.

HOLYOKE, MASS., MARCH 5, 1883.

**QUEBEC FISH AND PROTECTION CLUB.**—Quebec, Canada. The adjourned meeting of sportsmen and others to form a club to prevent the illegal slaughter of game, etc., was held on Thursday, the 15th inst., at the Board of Trade rooms, in which were present, Messrs. J. H. Sewell, W. A. Griffith, G. H. Thomson, F. C. Wurtelle, Richardson, McNabb, Gauvreau, C. Deau, W. D. Campbell, Graddon, D. C. Thompson, C. P. Dean, C. F. Smith, H. Stanley Smith, J. Hamilton, Jr., and A. F. Hunt. W. D. Campbell was appointed chairman, and F. C. Wurtelle secretary. It was then moved by D. C. Thomson and seconded by W. A. Griffith, and carried, that the constitution of the Quebec Fish and Game Protection Club, and those present do sign the constitution. Moved by W. A. Griffith and seconded by H. H. Sewell, and carried, that this meeting do adjourn until the 26th inst., when a general meeting of the club will be called for the purpose of electing officers, adopting by-laws, and other business. In the meantime a committee be named to prepare a draft of by-laws, to be submitted at next meeting, and also that between this and the next meeting the members be requested to induce their friends to join the club. Copies of the constitution were prepared and put into the hands of several members for signature. Before the meeting separated those present enrolled themselves as members of the Quebec Fish and Game Protection Club. —F. C. WURTELLE, Secretary *pro tem*.

**MONROE COUNTY SPORTSMEN.**—Rochester, March 4.—The annual meeting of the Monroe County Sportsmen's Club was held last evening at the rooms in the Arcade, President M. M. Hollister in the chair. L. A. Pratt, secretary and treasurer, presented his fifteenth annual report, showing cash on hand \$363.84 and no debts of consequence. The number of active members is sixty-two. The Committee on Game Laws reported that they had made suggestions to the members of the Legislature on the new game law, and thought that the suggestions would be adopted. They recommend that trout fishing begin April 1, and that imported sparrows be taken from the list of birds which may not be shot. M. M. Hollister was re-elected president, James H. Brown vice-president, and A. L. Pratt secretary and treasurer. The chair appointed as Finance Committee George W. Crouch, Jr., and Edmond Redmond; Vigilance Committee, J. B. Hooker, Homer Jacobs and James T. St. John; and a committee on supplies for the State convention. —J. B. HOOKER, Secretary.

**THE AIR-SPACE.**—Philadelphia, Feb. 28.—The experiments which I commenced last fall, having for their object a determination of the question as to the effect of "air spaces" in rifles, etc., have been progressing, though slowly, during the winter. It has been impracticable to secure here permanently a room in all respects suitable for such a purpose; hence, I have had to use distant fields and to defer to the weather. I must ask the indulgence of some correspondents whose queries I shall not be able for some weeks to answer. The results of these experiments will also be delayed in publication. To some readers access to a postal card I will endeavor to mail a copy of a daily paper giving some of the results. This trial has to do with rifles principally; but I am trying some shotguns—arms that I think ought not to be fired in that way. A Colt twelve-bore, seven and a quarter pounds breech-loading gun, which I tested some days since, however, stood forty-five discharges, showing no injury whatever. —W. McK. HEATH.

**A CRUSTER DECKED.**—Central Lake, Mich., Editor Forest and Stream: In "Michigan Notes," page 69 of your paper of Feb. 22, you say the snow is ten feet deep! My communication read "three" (3) feet, and that is about all we can "get away" with to good advantage. Please correct. One man in these woods "crusts" a buck, the other does not. I am crusting a river with his plunder (the correct term, I believe) he broke through, mercury about the ephers, and a pair of thirty-six inch snowshoes on his feet. The buck floated off under the ice, and after several ineffectual efforts to climb out, the man was obliged to sink, or drive until he could manage to loosen the snowshoe-slides, when he succeeded in getting ashore. Now, if there had only been an efficient game warden to clasp his claw upon the soaked and shivering law-breaker, and give him a taste of his quality, the misfortune of that particular "cruster" would have been as complete as anything I happen to think of at this writing. —X.

**NEW HAMPSHIRE.**—Colebrook, Feb. 28.—Nature has caused the slaughter to pause, and the deer are having fine time on the crust. Dogs and their allies fail to catch them. I visited Second Connecticut Lake last week; found "Uncle Tom" in happy solitude, catching beaver and otter, and anticipating what the next day's excursion along his lines would bring to hand. Logging crews have not encroached upon the game resorts about that lake, as the main operations are confined to the upper towns of Vermont. —NEO NORTON.

**ENFORCING THE MAINE LAW.**—Bangor, March 3, 1883.—Editor Forest and Stream: Warden Morse went to Dover last Tuesday to get three parties indicted before the grand jury. After attending to that agreeable little ceremony he crossed the river for the winter, for he is of an inquiring turn of mind, and looked into the American Express office there. Thirteen saddles of venison packed in barrels and boxes rewarded his research.

**TENNESSEE.**—Memphis, Tenn., March 3.—Mr. W. A. Wheately, of Memphis, Tennessee ("Guide"), recently had a pleasant visit at home from Mr. Justus van Lencrpe, of New York. One afternoon was spent at Mr. Jerry Cockrell's kennels; one over the traps with fifteen Memphis sportsmen, the guest making best score, and one day affix, four guns bagging seventy-two quail and a few snipe.

**TARIFF ON FIREARMS.**—The tariff on firearms which will go into effect July 1, is: On breech-loading guns of all kinds, 35 per cent.; on muzzle-loading guns of all kinds, 25 per cent.; duty on vuds, 35 per cent.; on cartridges and cartridge shells, both metal and paper, 35 per cent.; on percussion caps, 40 per cent.; on gun materials of all kinds, 45 per cent.

**MICHIGAN QUAIL.**—Grand Rapids, Mich., March 2.—Birds have stood the past severe winter here unexpectedly well. Many beaves alive and well have been seen lately and no dead ones reported. —E. S. HOLMES.

MISS M. L. ROESSE'S ORANGE AND WHITE ENGLISH SETTER DOG "COSSACK."

Winner of First Prize in Open Class for English Setters, Washington, 1883.

huge ocean steamers scare all the fish out of their course between America and Europe? Who has any evidence that the denizens of the great deep have any fear or respect for the floating craft on the surface?

If the argument is that by steamer fishing the menhaden are caught so rapidly that they are reduced so much in number as to show a lamentable decrease, the folly of such a position is evident at once, when it is known that very rarely, if ever, is a fish caught with spawn, and further, who does not know that the multiplication of these and other fish is too rapid for any manifest depletion by human agency. The spawn of the menhaden produces 150,000 living fish, and Professor Baird estimates that 1,200,000,000,000 fish are consumed by the bluefish alone in a period of four months of summer and autumn along the New England coast. And yet who notes any diminution of the quantities of fish? That billions of menhaden are digested by voracious fishes is undisputed. Every voracious swimmer feeds upon them. Whales and dolphins feast upon them by the thousand; sharks do full duty in destroying them, one hundred having been found at once in a shark's stomach, and the tunny makes horrible havoc, not only killing for food but destroying for pleasure. The pollock, the whiting, the garfish, bluefish and bonito—in fact every carnivorous corsair that swims in our coast waters, from Casco Bay to Brazil, gorges itself with the menhaden, and yet the accidental scarcity just now is attributed to the terrible fact that man takes from the ocean waters some eight hundred to nine hundred millions annually of these fish. In 1878 the menhaden oil and guano industry employed 64 steamers, 279 sailing vessels, 3,327 men and a capital of \$2,550,000, and took and consumed 777,000,000 fish. Now allowing Prof. Baird to be within ten miles of the truth in his estimate of the destructiveness of the bluefish, the above number caught by the menhaden fishermen is not a drop in the bucket of what is destroyed. Moreover it is well known to all intelligent men that a free and full catch of fish, especially those hugging the shore, tends rather to their increase than extermination. Whoever studies the science of ichthyology and the business of fishing in the open sea will not dispute this position.

To sum up our brief statement we aver:

1. That striped bass do not feed on menhaden.
2. That the habits of menhaden are not fully understood.
3. That catching menhaden does not visibly diminish their number.
4. That steamer fishing does not scare them.
5. That the number caught by men is of no perceptible account in the vast multitude destroyed by voracious fishes.
6. And, lastly, that attempt to connect the small number of menhaden with a diminished supply of striped bass is wholly illogical and unworthy of scientific discussion.

STATE OF RHODE ISLAND, ETC.

NEWPORT, R. I.

Be it known that on this twenty-sixth of December, A. D., eighteen hundred and eighty-two, before me, a notary public, duly commissioned and sworn, residing in Tiverton, in said county and State, personally appeared Gideon Mosher of said Tiverton, and being sworn according to law, testified as follows:

How long have you been engaged in the bass fishery? Ans. Forty-five years.

What from your observation do bass feed upon? Ans. Crabs and lobsters.

From your observation do bass feed upon live menhaden? Ans. They do not.

Have you been in the habit of preparing bass for market? Ans. That was part of my business for thirty years or more, and I have prepared tens of thousands of bass for market, but I have never found any menhaden in them, except what had been fed to them for bait.

How long a range of coast does your experience cover in taking and observing bass? Ans. My experience goes from Monomoy to Beavertail. My observation goes from Baltimore to Cape Cod. I have found the bass the most numerous in Chesapeake Bay, which I attribute to the great quantity of crabs that are found in that bay. I have always observed that bass fishing was best when lobsters and crabs were most plentiful.

Where has been your principal locality in taking bass? Ans. West Island, Rhode Island.

How many years before the West Island Club was formed were you located there? Ans. About thirty years.

What has been your experience as to the plentifulness and scarcity of the bass? Ans. When there is plenty of feed (lobsters and crabs) there is generally plenty of bass. If feed is scarce, bass are scarce.

Do you think the absence or presence of menhaden on this coast affects the bass fishery? Ans. No, except in the difference it makes to the catch by having or not having fresh bait.

What has been your experience in regard to bass bait? Ans. You cannot catch bass with stale bait.

Do you think menhaden taken in the vicinity of Sandy Hook, carried to a factory and from there transhipped, are likely after arrival here to be fit for bait? Ans. No, sir.

Providing the menhaden in 1883 are as far from this coast as they were in 1882, how would you proceed to get fresh bait? Ans. I should put an experienced man on board a menhaden fishing steamer and let them alive. The bank fishermen treat them in that way and preserve them in a fit condition for bait for a month.

Is the bass a rover of the sea or shore fish? Ans. He is both a rover and a shore fish.

Have you ever been engaged in the menhaden fishery? Ans. Yes.

What is your observation and experience as regards bass and menhaden? Ans. I never observed or heard of bass feeding on or troubling menhaden. My business has brought me in contact with many of the most successful menhaden fishermen, and have never heard of but two bass being taken in a purse seine.

Subscribed and sworn to before me, the said George N. Durfee, notary public as aforesaid, the day and year first above written.

GEORGE N. DUFFEE, Notary Public.

We, the undersigned, indorse Gideon Mosher's statement in full.

Bass Fishers of  
Newport,  
R. I.

GERMAN TROUT IN AMERICA.—The North German Lloyd steamer Werra, which arrived on February 24, brought 80,000 eggs of two kinds of German trout. They were sent at the request of Professor Baird, and came in care of Mr. E. G. Blackford, consigned to Mr. Fred Mather, superintendent of the New York Fish Commission hatching station at Cold Spring Harbor, Long Island. One lot of 60,000 described as "An enormous trout, the upper Rhine (Baden), and the other 20,000 is called "That delicious but very small mountain trout of Baden highly esteemed by epicures." We have at present no further information concerning these fish, and think it possible that the larger one may be the common brook trout of Europe, *Salmo fario*. Whether the small one is a distinct species or only a variety we cannot say at present. The eggs came in good order, and were presented by that enthusiastic promoter of fish culture, Herr von Behr, president of the Deutschen Fischerei Verein, from the ponds of Oberbürgermeister Schuster, in Freiburg, Baden. We shall look anxiously to see how these fish thrive in this country, and also to test their merits.

CARP IN WASHINGTON TERRITORY.—Seattle, W. T., Feb. 16.—We are about to try the experiment of carp culture in this Territory, three cans of the fry having been received at Fort Townsend and one at this place. They traveled all the way from the East in small tin pails, and seem to be none the worse for their long trip, as they are very lively and strong. As they are small, being only about two inches in length, they will for the present be placed in a shallow pond near town, and should they thrive and increase, will afterward be placed in Lake Union, a lake about a mile from town, three miles in length, which is at present inhabited only by trout and a kind of fish which we call chubs, although I think they are not the chub proper. I am not very much interested in the result of the experiment, as the carp, as I understand it, is of value only as a food fish, having no gamey qualities, and we are abundantly supplied with fish of all kinds for food.

### FIXTURES. BENCH SHOWS.

March 20, 27 and 28, 1883. Dominion of Canada Kennel Club, Bench Show, at Ottawa, Canada. Entries close March 12. Charles Lincoln, Superintendent.

April 3, 4 and 5, 1883. Western Pennsylvania Poultry Society's Eleventh Annual Bench Show, Pittsburgh, Pa. Entries close March 19. Chas. Lincoln, Superintendent. C. R. Elton, Secretary.

May 8, 9, 10 and 11, 1883. Westminster Kennel Club, Seventh Annual Bench Show, Madison Square Garden, New York City. Entries close April 12. Chas. Lincoln, Supt.

### FIELD TRIALS.

November 19, 1882.—Eastern Field Trials Club, Fifth Annual Trials, at High Point, N. C. Entries for the Derby close July 1. W. A. Coster, Secretary. Flatbush, N. Y.

December, 1882.—National American Kennel Club, Fifth Annual Trials, at Grand Junction, Tenn. D. Bryson, Secretary. Memphis, Tenn.

To insure prompt attention communications should be addressed to the Forest and Stream Publishing Co., and not to individuals, in whose absence from the office matters of importance are liable to delay.

### BEAUFORT AND COSSACK.

WE give this week cuts of the pointer dog Beaufort, owned by Mr. C. H. Nixon, Leesburg, Va., and of the English setter dog Cossack, owned by Miss M. L. Roessle, Washington, D. C. Both dogs won first in their classes at Washington. Beaufort is a fine, large, upstanding dog of great beauty, and one of the best Bench Show pointers that we have seen in a long time. His owner informs us that he is also a capital dog in the field, and that he will run in the Trials next fall. He is liver and white ticked. He is three years old, and is by champion Bow out of Beulah, who is litter sister to Mr. Orgill's champion Rush.

Cossack is also an animal of rare beauty of form with a splendid coat and feather. He comes honestly by his good points, his sire being Mr. Theodore Morsey's Don and his dam Mr. Chas. H. Raymond's Fairy. He is nearly white, with orange markings. He is just in his prime, being nearly four years old. The cuts are from sketches by Harry Tallman.

BEAGLE JUDGING AT WASHINGTON.—Philadelphia, Pa.—Editor Forest and Stream: I wish to criticize the judging of beagle hounds at the late Washington bench show, and think I have just cause for so doing, for, as I understand, one of the principal objects of a bench show is the bringing together of the different varieties of the best dogs in competition, and to have a dog win alone on its merits, by honest judgment, with a judge who ought to know what he is to judge by and for, I felt secure in making my entry for the show, that the gentlemen who had gone to the trouble and expense of getting it up would have had a competent judge, one who would have known the points necessary for a dog to win; such I find, however, has not been the case, and had I been present just after the judging of the class (I entered) I would have entered my protest, but not getting to the show until the next day, I was informed I was too late and was not allowed to enter it then, so I requested to be introduced to the judge, and had, for the first time, the pleasure of meeting Mr. C. H. Mason. When after a few moments' conversation I asked him (as an exhibitor I had a right to do) if he would be kind enough to show me the difference in value by points of the winners over me and also to show where my dog was deficient, by so doing he would greatly oblige me, he said, "Mr. A. I know nothing about beagles, I have made a guess of it and will state what I make up my report." Now I would ask where the satisfaction is to an exhibitor, who, going to the trouble and expense to get dogs in proper shape for a show, by such proceedings as that. A gentleman (and one who knows), one of my competitors, said to me, "You should have had first," when I only got an "bc." It is gross injustice to exhibitors to send to shows and have their dogs judged after such confusion by a judge as that, and I hope hereafter when judges are selected they won't have to make such confessions, —W. H. ASHBURNER.

MR. C. H. NIXON'S LIVER AND WHITE TICKED POINTER DOG "BEAUFORT."

Winner of First Prize in Open Pointer Class, Washington, 1888.

# THE GREYHOUND.

*Editor Forest and Stream:*

The attention of American sporting gentlemen has for many years been directed to the improvement in the breeding of pointers, setters and other game-seeking dogs. These game-seeking dogs are the sportsman's aid and companion over many a weary tramp in search of feathered game. But every gentleman does not use a gun or have the privilege of sporting preserves or good game country. With these few remarks I would respectfully introduce to the American sportsman, whether the "crack shot" or the "just for fun," the well-known but little used English coursing greyhound. This grand breed of dog, whose vocation, like that of the bloodhound, is not yet gone, and whose antiquity is such that, long before the signing of Magna Charta, his destruction was looked upon as an act "equally criminal with the murder of a fellow man," claims your patronage. For many years the kennels of our sportsmen and the benches of our shows have shown but few specimens of this "flying course." But there would seem a time not far distant when greyhound coursing will rank as one of the gentlemanly sports of America.

To the true sportsman the race-course has always had something "fast" or degrading in its associations. Every gentleman cannot keep his racing stable and its expensive equipment, but every American sporting gentleman can, upon a far more economical, respectable and high-toned basis, maintain his brace of coursing greyhounds at a mere nominal cost.

In 1591, England's queen, from the turret of the castle, witnessed these fleet dogs in their coursing, and to this day the grand coursing meets of England are as well known as the celebrated Derby, Oaks or Goodwood Cup. And the names of Donald, Mistorion, Contango, Judge, Buccaneer and hundreds of others who have carried their noble owners' colors to the fore on many a "pumping course," are as celebrated as the winners of the racing calendar.

The greyhound runs or courses only by sight, and as we have plenty of fine, level tracts in close proximity to our large cities, coursing, as a gentlemanly sport, can be readily introduced. The English hare is not difficult to procure, and in de't, the "jack-rabbit" of the West, a "chick" in himself, will give us a good greyhound all the running he can wish and bring out his points of endurance and fleetness.

As a fancier of greyhounds I would say that freshly imported stock does not do well in this country until they have become accustomed to our climatic changes, but they are easily acclimated and become hardy, easily kept and perform well. We have in the many greyhounds now shown at our bench shows, the opportunity of introducing greyhound coursing as a gentlemanly sport.

Let us endeavor to raise our greyhound standard still higher, and let this noble and neglected dog come in for a share of sporting honors. And may the day soon come when the coursing meets of America will have their share of attention and thousands be charmed in seeing the greyhound "well slipped" watch closely the "turn," the chase, the "go by" and the "kill." Then the coursing cup of the Westminster or some other club will have its regular patrons, and its possession as eagerly sought for as the champion medals of the bench shows circuit.

JOSEPH R. PRINSON.

BUCKINGHAM, Pa.

**PITTSBURGH DOG SHOW.**—In explanation of my name appearing in the Pittsburgh premium list as judge of certain classes, I would state that I received a letter dated February 3, requesting me to act in the classes I had passed upon last year. I replied as early as possible that I felt it was impossible for me to absent myself from business and respond to their kind invitation. There I presumed the matter rested, as no reply, but on February 17 I had a visit from Mr. Elben, who handed me a premium list on which my name appeared. I then stated that I would reconsider the possibility of my accepting the honor thus thrust upon me. However, I found it impossible to do so, and I so informed Mr.

Elben on March 1. I very much regret that I could not oblige the Pittsburgh committee in return for their last year's kindness.—JAS. WATSON.

# THE RED IRISH SETTER.

*Editor Forest and Stream:*

In your journal of the 11th ult. I read with deep interest a letter on "Dogs and Trials," by "Pious Jeems," and owing to a statement of his, which I consider a libel on the Irish red setter, I feel constrained to ask you for space to say a few words in defense of my favorite.

I am not, of course, in a position to dispute the assertions, "That in his experience the Irish always were a failure at field trials," but the impression it has made on my mind is that his experience of Irish setters must have been very limited indeed, or he could not possibly have so maligned the finest breed of sporting dogs in all the world. No doubt long ere this some friend of the Irishman has come to the rescue. I know one at least who knows and appreciates his worth and the better. But "Pious Jeems" adds further, "That with the will he will be quite ready to break a lance on his behalf. I allude to the well-known 'Mont Clare,' who, as I am aware, has a few good ones in his kennels, field trial winners, too, and if 'Pious Jeems' has not seen them the sooner he does the better." But "Pious Jeems" observation were of that class so many of which are bred for the market nowadays, weedy, snipe mongers of the first water, utterly unlike, save in color, the pure bred, handsome and dashing Irish setter. That numbers of this class of so-called Irish setters do cross the Atlantic I have had abundant proof, having seen many of them shipped at Queenstown during a residence of some years there. That they could not be the same animal about which "Idstone," "Stonchenge," "G," and hosts of well-known sportsmen have written, is, however, certain, for the former, a well-known authority on the subject, says, "That he had seen and known a good many Irish setters and he candidly confesses that he never knew or heard of a bad one," but this most wonderful "Llewellyn," whence does he trace his descent? From the Laverack, "whose crowning glory" it is, says "Pious Jeems." And does he not know by this time that the Laverack has Irish blood in his veins and that to this fact, beyond a doubt, he is indebted for some of his best and finest qualities? I notice that "Vitius" in your journal, in alluding to the fact that the Irish are so much crossed with other breeds and the produce entered as a pure breed of either one country or the other gives this as the cause why the Irish setter has dropped to the low standard he holds in America, but it seems to me that there is a further cause and it is this: That your countrymen spare no expense in procuring the very best Laveracks or Llewellyns from this country. They are the rage at present, and I do not for a moment attempt to deny their excellence, but I do most emphatically deny that for style, pace, nose or stamina they exceed the merry Irish red, he being the oldest and purest setter, has been used for the purpose of giving backbone to some breeds and forming others, with what good results is well known, whereas, if any part of the time, care and money lavished on other breeds had been spent in improving him, sportsmen would be in possession of a setter, in color gorgeous, in form a model of grace and beauty, and in all the qualities necessary in a sporting dog, holding a position second to none in the world. I need scarcely say that I am an ardent lover of the breed, and I have bred some good ones in my time, the celebrated Plunket to wit. For some years past the exigencies of the service to which I have the honor to belong have, however, prevented me from doing more than merely preserving the grand old breed, but I cherish the hope of being able at no distant date to prove that my favorite is worth the faith I have in him.

ROBT. O'CALLAHAN, R. N., Chaplain H. M. S. Hector.  
Netley, Southampton, Eng., Feb. 3, 1888.

# IN RE BEAGLES ET AL.

their heads are hung  
With ears that sweep away the morning dew;  
Slow in pursuit, but match'd in mouth like bells,  
Each under each.

—Mitsamoor Night's Dream.

WHEN such a genial gentleman and evident lover of hounds as "Dorkin" is calls for my "idea of a dog," I am constrained to make a brief hiatus in my papers on angling and write a few words upon the "little hound," except the beagle, as by "dog." I infer that that particular breed is meant. "Dorkin," however, must pardon me if I decline to give, in *minuting* my best ideal of a beagle, for a person's ideal of any thing, animate or inanimate, is his own picture of perfection, and as one man differs in many ways from another so does his ideal. This is evident and need not have been expressed, but pups and hounds will "run riot" sometime.

I claim to be no judge of dogs, of any breed, but I love and admire them—yes! I respect them, and always like to have one near me. I very seldom use one in the field to shoot over, for I very seldom shoot, being a lover of the single rather than of the gun. Of all sporting dogs I prefer the beagle because he is petite, pretty, companionable and affectionate, and furthermore, because he is of ancient lineage and can boast of royal patronage. Of course there must be a standard of excellence, and I have no doubt that if "Dorkin" and I could agree on one, we could soon make a short pilgrimage to the kennel of a common friend and find more than one beagle to fill its requirements. With King-wood, Elmore's celebrated stud dog, and with some whelps of his "got" I have the privilege to be acquainted, as also with King, Lucy, Music, the imported "basket" bitch, and others of "that ilk."

Now, I venture to join with "Dorkin" in the hope that the constituted judges at bench shows may fully know what they are expected to judge, and that such an honest standard of pure beagles may be adopted as shall be beyond all cavil. Will "Dorkin" clasp hands with me over the above? The beagle is an "interesting" dog, either in the field, "a hunting of the hare," or as a gentleman's pet and companion, and is bound to come "to the fore" as a favorite.

"Every dog has his day," and as "history repeats itself," so doth the fashionable fancy for different breeds. I am as one with "Dorkin" in his demand for pure blood, for I believe in "blood" thoroughly. It is "thicker than water," and whether flowing in the veins of man or beast it should have no taint. There are too many mongrels (both bipedal and quadrupedal) in the world now, and a bit of advice to all may be summed in one word, "Ware!" and I repeat it, "Ware!" Intelligent and judicious breeding and honest judging will give us a race of dogs to be proud of, and very low in the scale of humanity is the soul who is not proud of a fine-bred dog. There are such, but I always feel like giving a "cautionary signal" when I see them—they're the stoats and "other vermin" in the social economy and should be "run to earth" and effectually "stopped."

My dear "Dorkin," do you catch my "idea" of a beagle? When I go for my next puppy to friend Elmore's kennel, I will give you an "object lesson" if you are "to the fore." Shakespeare knew a good hound and I doubt not he had a beagle, or pack of them, in mind when he wrote what I have made the caption of this paper.

"Good Queen Bess" was an ardent lover of the beagle and especially of the "basket" breed of which she had some very tiny and perfect specimens. I hold the *FOREST AND STREAM* to a "fang syne" promise to give an article on the beagle, and join with you in wishing well to the breed and breeders. *Adieu.*

O. W. R.

**THE COLLIE AWARDS AT WASHINGTON.**—In the list of awards last week in Class 54, Mr. J. W. Burgess's (East Orange, N. J.) Jean, black and white, 10 months, should have been first instead of Mr. J. W. Lindsay's Kitty Mac, who was vho.

### THE CARVER-BOGARDUS MATCH.

[From our Regular Chicago Correspondent.]

CHICAGO, March 3, 1884.  
 Local pigeon shots, sportsmen and lovers of hunting sports have been pretty thoroughly aroused lately over the Bogare case, after much and different opinion has been expressed.

driving Park Saturday. The southwest wind, though bred the contestants, and the only drawback was the sloppy of the park. Bridges of planks enabled the 2,000 spectators to reach the grand stand and club house. The match was at the best driving park in the West, and everyone can see admirably from the club house or grand stand.

shooting grounds were laid off directly opposite those quarters. Sawdust and platforms gave the shooters, referee and mark a foothold. A regular blockboard, unobtrusively placed, and

blackboard. A regular blackboard, prominently placed, enabled markers to show the crowd the score as under. S. H. Turley, one of our old-time trap shooters, and the best man that could be

selected for the position, acted as referee very satisfactorily. The other trapping arrangements were perfect.

It is settled to the minds of most local sportsmen that the two shoots both show Dr. Carver to be the superior under the terms they have so far contested.

that an old shot standing near remarked, "I think you'd do better if he waited longer with his second." Still he did this advice, judging from the way he shot that day.

gun, which has caused a very painful soreness from the recoil of a gun. Both men, though, were firm and determined. They had little chance on losing a bird, and emptied both barrels. The terms of the shoot were the same as at Louisville, 100 birds.

to the grand shoot of the day the two crack shots had a

match, clay pigeons. This commenced at 12 M. Mr. Reese, president of the Ligowsky Clay Pigeon Company, having offered \$250 if either Carver or Bogardus could break 82 clay pigeons of 100. As a test of game shooting, the trial is scarcely a fair one, the disks of the clay pigeons being the size of the target.

for the night or the clay pigeon from the trap resembles the down bird. As a test of quickness of hand and eye it is a different thing, and a man that can break a clay pigeon is decidedly a good shot, even though he might not be deadly with a snipe and quail.

Shortly after 12 o'clock Carver and Bogardus appeared on the field to shoot the clay pigeons. Mr. Lovelady was referee, and Mr. Miller represented the firm of Ligowsky & Co. The match was at 30 yds., and the following was the score taken by the referee:

gardus - 00101011111011111110001010111111110100101010100  
 00011110101010001111011110000100. Total, 69.  
 ever - 01101011100111101111101111010101101111100101111  
 101011110100110100111000101111110. Total, 72.

er lunch came the regular match. The birds were an average, though not extra strong. At the start Carver got his first birds, then missed his fourth, but laid low all the rest of the ten birds, causing great applause.

His second scored, but his third and fourth, though killed, end out of bounds. His fifth he killed, his sixth, dead out of bounds, while he got three out of the remaining four of his first

out of the second ten was Carver's luck. The fifth bird was a cinnamon, which received some bullets, but flew away. The seventh was Bogardus in his second ten. The score then stood 18, Bogardus 13.

The fourth round opened with a miss for Carver and then eight birds killed. His opponent crept up a little, getting "a miss" and three "kills." The lead of them still remained the same.

When the sixth ten were finished, both men had nine killed. Ten were finished in the seventh, when both men scored seven out of ten.

to ten. Then the Chicago champion awoke from his lethargy and reduced the lead by getting nine to Carver's seven birds on the eighth round. Carver missed his third, ninth and tenth birds, but the Captain killed all but his third bird. Carver killed seven on the ninth, six in the ninth both, resulting a hand buck for

of a still further lead by killing eight to Bogardus's seven, finishing by three birds. It was very close and a good score. I

[illegible]

mediately after the conclusion of the match Bogardus challenged Carver to shoot him, half English and half American rules, for \$1,000 or \$500 a side. The match will hardly take place, however, as it is understood Carver will do but little, if a

So, at least, he expressed himself to your correspondent. Bogardus said, in an interview with the Forest & Stream reporter: "I don't know much about these light guns; I am accustomed to a 10lb. gun, and I beat every one in England with one of that weight. I will shoot Carver a match at 100 birds, 800

with a gun of that weight. It is true I am getting old, but I will not interfere with my shooting. When it does I will yield. I have shot Carver for six days for \$50 a day, and the Forest Service may say so." The gate receipts are said to amount to about \$1,000, and the winner of the match, who, they state, is 61 years old, will receive \$1,000.

and go to the winner of the match, who thus gets \$1,000, sold even before the match. Both men remain in the city for so.

and of course both defector and defeated were called upon reporters to have their opinions recorded. Captain Bogardus ledges his defeat squarely, and says of the victory of the Doerflinger, "I wish to say a few words in regard to the pigeon match at Louisville, Ky., between Dr. Carver and myself. I never had such

in my life in any pigeon match I ever shot. I would not, time, have given anybody ten dollars to have guaranteed a match, but my bad luck in having birds fall dead out of bounds. Upon arriving in Chicago, I found a few gentlemen, who were watching the matches sitting around the store, and never did a bird

I will shoot them or any man in the world, barring Dr. Carver, under the same rules, and will give them one yard in a race. My reasons for barring Dr. Carver are, that he has been

ing under these rules in England for the last three years, who not accustomed to shooting a light gun, this being the first in my life in which I ever shot one. I still think I can do it, and beat Dr. Carver or any other man in the world at gun shooting, and I have money to back my opinion."

Carver chats in an interesting way at his hotel in Chicago, under the weather with a cold and was found in his room, lying down. He did not look like a very sick man, though it was evident he was suffering from a cold, but then a man six feet two inches tall and weighing 250 pounds is not easily affected by colds.

weighing 216 pounds with a fair complexion and robust body is in no way ill. The doctor was plainly dressed, and wore a pair of boots, reaching to the thigh. A very handsome pin with the letters F. V. in diamonds and rubies, surmounted by an imperial crown, glittered in his neck tie. The doctor greeted the interview-

cordially, and in answer to a question concerning his health he was better, and continued: "But I generally have a cold. I shoot. When I was in England I hardly shot a match without suffering from a cold. The victory at Louisville was a cold, and about the hardest that I ever shot. I wish you were at it."

about the hardest hunt I ever shot. I only won the match last thirty birds, and it was tremendous work. Do you know though we only scored 82 and 89 every bird but one was hard! Most of them just dropped outside the boundary. The birds were remarkably good ones, and though a few would not get up

when the did they went away very strong. Very few flew. I was afraid the Chicago boys dropped their money, as they did not know I had improved in shooting since I came back from the West, and, I think Bogardus was astonished." On the day of his trip abroad Dr. Cameron said: "I left New York in

On the 27th of April, 1879, I left New York in a ship bound for England. Dr. Carver said, "I will shoot for you," and gave me my first exhibition shoot with the rifle at Weymouth, before the Prince and Princess of Wales and the Duke of Edinburgh, and some sixty of the nobility, on the 30th of April, 1879. A few days afterward the Prince sent me

Dighton Probyn, a gold horseshoe scarfpin, studded with emeralds, and having in the center the Prince of Wales feathers, and colored precious stones in the band of the coronet. I am very

## KINKS IN RIG.

Editor Forest and Stream:

As I am greatly interested in the subject of single handers it occurred to me that it might be of interest to some of your readers to know of an arrangement which I have been trying for a couple of years on my small schooner. I bought of a harness maker a number of galvanized hatter snags, made to receive the end of a rope half instead of a strap, and spliced one of these snags on to the end of each piece of running rigging on my yacht. Thus my halliards, sheets, downhaul, etc., are all capable of being detached in a few minutes. To owners who are accustomed to strip their own craft each fall and fit them out again each spring, this scheme will I think appear very forcibly. I have also found it very convenient in changing or modifying the rig, as you can dislodge the yacht of every particle of running rigging without any assistance, and can replace it in much less time than by the common method.

My yacht is twenty-five feet over all, and I am convinced that the rope snag will be found useful on all yachts up to thirty-five feet. There may be a better method, but I believe there is none more cheap, and easily attained by everyone.

In conclusion, let me say that I like the looks of the Fendear, and I have had in mind a similar scheme for some time, as I believe in the theory of lateral friction, and of course the nearer straight the frames the less surface exposed. Respectfully yours, NIM.

ROCHESTER, N. Y.

CHICAGO Y. C.—Cash prizes to the amount of \$1,500 will be offered for the annual regatta, which will be sailed about August 1. Photographs of the Fleet Club, open to all schooners, together with printed programmes, will be sent to all Eastern yacht clubs, in the hope that some of them will send representative boats to Lake Michigan.

BEVERLY Y. C.—Beside the fixtures at the head of these columns the club will sail two matches at Monument Beach, one open to club yachts only, the other to all comers, dates not yet settled.

PERSONAL.—Mr. Beavor Webb, of London, the designer of Buttercup and Medusa, cutters, now building in Boston, will be in this country in September as a party to some races Medusa is nominated for.

HULL YACHT CLUB.—For the interesting statistics concerning this club we are indebted to a very creditable compilation from the pen of Mr. Peleg Aborn, 117 Devonshire street, Boston.

Sudden Changes of Weather are productive of Throat Diseases, Coughs, Colds, &c. There is no more effectual relief in these diseases to be found than in the use of BROWN'S BRONCHIAL TROCHES. Price 25 cts.—Adm.

## Answers to Correspondents.

## No Notice Taken of Anonymous Correspondents.

E. D. C., Butler, Pa.—The cross of English and Irish will produce good results.

E. H. P., Stamford, Conn.—For general shooting in your State select a .40cal. .31gr. rifle.

J. W. E., Montgomery, N. Y.—For advertisement of "Schwatzka's Search" see our advertising columns.

F. H. S., Cleveland, O.—You can use five drams with perfect safety, providing that the gun is sound.

D. K. E. F.—We know of no one wishing to dispose of a complete second-hand amateur photographic outfit.

J. W. D., Richards Landing, Canada.—For information about Oregon State lands, write to State Land Office, Portland, Oregon.

E. D. L., Arrow Rock, Mo.—1. For foxhounds write to T. G. Tucker, Gaston, N. C. 2. There is but one species of red fox in this country.

L. H. C., Doyleston, Pa.—We do not know of whom you can procure suitable crow for trap shooting. You might employ some farmer to trap them for you.

C. X., Millersburg, Pa.—1. Will either Cune's "Field Ornithology" or Cune's "Check List" enable me to identify the natatoris and grallatoris of this section? 2. Which will the better serve my purpose?

Ans. Neither work will answer your purpose. Cune's "Key to N. A. Birds" is what you want, but it is out of print, we believe, and hard to obtain.

B. D. D.—1. To remove lead from your gun barrels, use kerosene oil and a wire scrub brush. 2. For glass ball shooting, use No. 8 or No. 9 shot. 3. There is no material difference in practical field work.

THURMERS, Winnipeg, Manitoba.—1. For all round shooting in Rocky Mountains select a .45 caliber, chambered for 100gr. powder. 2. Harris, 177 Broadway, may supply parts of the other rifle you want.

W. T. E., Concord, N. H.—Is Stoddard's map of the Adirondack Wilderness on regular news paper and meat 2 hanging on the wall or does it fold up like most maps in guide books? Ans. It can be supplied in either form.

Far Jack, South Norwalk, Conn., March 4.—To-day while returning from a fox chase, I started a good sized woodcock. Do you think it is a new comer or an old resident? Ans. A new comer. It was early for this season, but not for the time of year.

G. H. D., Carson, Nev.—1. Use of a .24in. shell in a .26in. chamber does interfere with correctness of shooting. 2. The gun will stand reboresing. 3. You will find .26in. shell sufficient for ordinary shooting; if you wish to use heavier charge have the chamber enlarged.

R. L. C., New York.—How long after birth should the tails of foxtier puppies be cut? 2. Is there any particular way of performing the operation which is better than any other? Ans. 1. About ten days. 2. Use a sharp pair of shears and cut quickly, leaving the tail an inch long.

C. B. P., South Britain, Conn.—1. There are fair but small grounds for snipe about eight miles from Westport. 2. On Long Island snipe go to Oakdale, on Long Island R. R., or to vicinity of South Oyster Bay. 3. For duck shooting on Long Island go to Good Ground, or Moriches, or Islip. The ducks will soon be there.

S. B. W., Augusta, Ga.—Jones and Smith marry two sisters; are Jones and Smith brothers-in-law? In other words, defunct relationship though now existing previous to marriage. What constitutes brother-in-law? Ans. You will find a definition of the term brother-in-law in the dictionary. Jones and Smith are not brothers-in-law.

E. K. F., Brooklyn, N. Y.—The shad bush or June berry is a shrub or small tree growing from ten to thirty feet high. It belongs to the botanical family Rosaceae, and stands near the hawthorne and the genus which contains the pear and the apple. The leaves of the shad bush are simple, ovate, serrated, and the flowers white in racemes, and the fruit globose, purplish, edible, and when ripe, in June, very sweet. It grows along streams and in moist places almost everywhere.

E. D., Salt Lake City.—1. How are antlers of elk or deer measured? i. e., in a direct line from butt to tip, or along the horn following the curves? 2. Which is regarded as of most value, great length or great circumference? 3. Other things being equal, which has the greater value, a head in which the antlers are perfectly symmetrical, or one in which some one or more unique peculiarities exist? 4. Is there any recognized authority on the above subject? What publication contains the rules and order, and where can it be had? Ans. 1. They are measured from butt to tip in a right line and not along the curve. 2. Great length which is usually but of course, not always, accompanied by great circumference. 3. This would be a matter of opinion and taste, but unless the symmetrical horns were enormously large they should be judged to give the preference to the unique head. 4. We know of none.

Roundabout roads are out of favor. Short cuts are popular and practical. Bessons' CAPSULE PLASTER is in this respect and in all others in advance of the times. It is fast superceding all other external remedies. It does not postpone; it acts to-day. Recommended by eminent physicians. It never fails to afford immediate relief. Price 25 cents. Word "capsule" cut in middle of the plaster.—Adm.

LEATHER KEEP DRY.—A perfect waterproof dressing for boots and shoes, makes them impervious to water, and softens the leather. No sportsman should be without it. For sale by Geo. L. Brown, 125 Federal street, Boston, Mass. See advertisement.—Adm.

CALIFORNIA BROOK TROUT.—Parties wishing to purchase California brook trout eggs can procure them by writing to H. Woodson, Fort Bidwell, Cal. See advertisement in our For Sale column.

## LUMPHREYS' HOMEOPATHIC VETERINARY SPECIFICS

FOR THE CURE OF ALL DISEASES OF HORSES, CATTLE, SHEEP, DOGS, HOGS & POULTRY. For Twenty Years Lumphreys' Veterinary Specifics have been used by Farmers, Stock-raisers, Horse R. R. Trains & Hippodromes, Menageries and others with perfect success.

## LIST OF SPECIFICS.

A. A. Cures Fever and Inflammation, Milk Fever, spinal Meningitis, Hog Cholera, 75c.

## COMBUSTIBLE REEL.

Patent January 17, 1892.

## QUADRUPLE MULTIPLYING.

Nos.	0204	0206	0207	
Capacity	40	60	80	Yards of Largest Size Bass Line.

This is not the "coming quadruple reel" but the reel already come. The only quadruple made on scientific principles, it is the smoothest and most perfect running reel in the world. With ordinary care it will last a lifetime. The simplicity of its construction makes it hard to get out of order and easy to repair.

Orders received from persons residing in cities in which dealers keep a full line of our goods will not be filled at any price.

## ABBEY &amp; IMBRIE,

Manufacturers of

Every Description of Fine Fishing Tackle.

NEW YORK CITY.

## Kynoch's Patent "Perfect" Brass Shells

MANUFACTURED BY

Kynoch &amp; Co., Birmingham, Eng.

These shells are made of extra fine thin pliable metal, with reinforced base. Use either Winchester or Wesson primers. Can be reloaded as often as any of the thicker makes. Cost only about half as much. Weigh less than paper shells, and in consideration of their reloading and other advantages, as inside diameter is nearly two gauges larger. They possess a great advantage over all other brass shells, as owing to the thin metal they can be closed (as represented) by simple use of the thumb or fingers, and straightened out to original shape when discharged. These goods have already gained a wide and favorable reputation in Europe, and in the opinion of many prominent sportsmen will soon supersede to a great extent the old style of both brass and paper. Samples will, upon application, be sent to any sportsman's club or dealer, and prices quoted to the trade only. For sale in any quantity by gun dealers generally, or in case lots only (3,000 shells) by

## HERMANN BOKER &amp; CO.,

SOLE AMERICAN AGENTS. 101 &amp; 103 Duane Street, New York.

WILLIAM READ &amp; SONS, Boston, Mass., Agents for New England States.

We also carry a large stock (at all seasons) of Kynoch's regular thickness brass shells, adapted to the Berdan Primer. Price materially lower than the American make of same quality.

# FOREST AND STREAM.

## THE PARK LEASES.

THE Secretary of the Interior has leased to the Yellowstone Park Improvement Company a portion of the National Park. The lease executed covers seven different plots in various portions of the region, which aggregate ten acres. The law as passed during the last session of Congress protects this national pleasure resort from being seized by a vast monopoly, and the orders of the Secretary of the Interior should be sufficient to save the geysers and the game from destruction.

By this law the responsibility for the care of the Park is placed where it belongs, that is with the Interior Department and its servants. The public will look with interest on the action of Superintendent Conger, who has now been furnished with money and means to patrol the Park. If he does his full duty, the work of destruction which for ten years past has been going on in this beautiful region will be checked, trespassers and butchers will be promptly dealt with and punished, and the game, soon recognizing that it has here a safe abiding place, will increase and multiply. If the superintendent is careless and slothful, if he appoints as his assistants a lot of Eastern men who know nothing of the mountains and the habits of game, the old style slaughter will be kept up. We have every reason to think that the superintendent will do his duty by the Park. He has already shown a deep interest in it, and this interest will no doubt increase rather than flag. We warn him, however, against falling into the mistake of appointing for his game keepers and police incompetent men. Let him make his selection of these officers from among the mountain men of Montana, whom he can easily find. From among them he can select good men, who will be honest, reliable, faithful and fearless in the performance of their duty. If the care of the forests, the game and the natural wonders of the Park be placed in such hands, we have no fears for their future.

Any failure to act up to the provisions of the law will

readily be learned of in a region such as this will soon be, and the assistants who fail to do their duty must speedily be removed and make way for better men. The responsibility of the Park thus resting on one pair of shoulders, it is certain that it will be well cared for, and the country looks to Mr. Conger to see how its Park is to be looked after. The people's temper has been somewhat aroused by the monstrous attempt to take from them their rights, and they will look sharply after this reservation for the future.

It is stated that other parties beside those above mentioned have filed applications for leases, and these the Secretary is now considering. A healthy competition in the hotel business in the Park is very desirable. If, however, the Improvement Company had secured their 4,500 acres of land as at first attempted, there would have been much opportunity for other hotels to have been started.

**A DISGUSTED DOG.**—It is Hamerton, we think, who says, in one of his charming essays, that a poor shot should never go into the field with a good dog unless he is willing to be despised by the dog. In another column our ever-entertaining correspondent "Wells" relates a story illustrative of this; and "that reminds us" of a similar case that once came under our own notice. We have owned several dogs who seemed to take great delight in the killing of the birds, and it was plain to be seen that unless the birds were brought to bag their interest flagged. Many years ago we had a dog who possessed this trait, which grew upon him as he became older until it was impossible to get a good day's work out of him unless we did our share. He was one of the best animals we ever owned, and one of the most intelligent. In those days we selected our shooting companions as we did our dogs—for their good qualities in the field—and we nearly always succeeded in bringing to bag birds enough to keep the old dog, if not at his best, pretty well up to the mark. After a long career of usefulness he became too infirm for anything more than an hour or two in the field, and was seldom taken out. One afternoon we loaned him to a friend, who was a capital shot, except that at times he would have a "poor streak." Both man and dog started off in high spirits, but when they returned it was plain to be seen from the dejected appearance of the dog and the sheepish face of the Doctor that their fond anticipation of sport had not been realized. The Doctor explained the matter by saying that he had had a "poor streak." Said he: "I never was so disconcerted as when I caught the reproachful glance of the old dog's eye after missing as fair a shot as I ever had; and as I soon repeated the performance, I could plainly see in his expressive countenance disgust as well as reproach. Although I have stood behind the trap and, amid the jeers and hoots of the crowd, missed my ten birds straight, I never was so utterly demoralized in my life, and of course I missed the next one, when the old dog, with a look that will haunt me to my dying day, hung his head and, curling his tail between his legs, dejectedly marched back to the wagon, and actually showed his teeth when I tried to coax him out again."

**JUDGES FOR THE NEW YORK SNOW.**—The judges for the bench show of the Westminster Kennel Club are as follows: Mr. J. C. Higgins, of Delaware City, Del., will judge the English setters; Dr. J. W. Downey, of New Market, Md., the collies and beagles; Mr. J. F. Kirk, of Toronto, Canada, some of the non-sporting classes. The remaining classes are, as yet, not assigned, although it is probable that Mr. E. C. Sterling, of St. Louis, Mo., will judge the pointers, Irish, and black and tan setters. This list is unexceptionable, and one that is sure to receive the unqualified approval of the exhibitors.

**PROPOSED KENTUCKY ASSOCIATION.**—Doctor W. Van Antwerp and other prominent sportsmen of Kentucky are about to form an association for the protection of fish and game in the State. Such an organization is needed, and if the new one takes hold vigorously and helps to enforce the laws, it will take higher rank than those clubs which exist merely in order to hold shooting matches. As the proposed society intends to assist in stocking the waters, let up hope that it will protect them from the depredations of thieves who would take the last fish in them by any means in their power.

**HOW MUCH HE MISSED!**—It is related of the eccentric Dearborn Giles, of Boscawen, N. H., who recently died at the age of seventy-seven years, that although the best trout-brook in the town ran through his land, he made his boast that he never owned a fish-pole, a dog or a gun.

## ANTIQUATED MILITARY ARMS.

THERE is a growing feeling in the ranks of the National Guard that when the State makes a demand upon the soldier for a certain amount of range practice, the State thereby incurs the duty of seeing to it that the very best arms obtainable are placed in the hands of the men. In many of the States this is not the fact at present, and the guard-men of this Empire State feel the annoyance of an antiquated arm probably more than do the soldiers of any other State. It was the guard of this State which established Creedmoor, and gave to modern rifle practice in this country its first impulse. Knowing next to nothing of the art of rifle shooting it is not surprising that for a time there was no open objection urged against the State model arm. It was the regulation weapon, and shooting home matches there was little hardship, as all were equally handicapped by it, but when the marksmen from other States came up to Creedmoor and engaged in the matches they came with the best arms obtainable, and it goes without saying that they were not the New York State arm. The New York boys found themselves pushed to the wall by men in no wise their superiors in knowledge of all the many details which go to make up the successful bullseye hitter, but there was the difference of a superior weapon, and this decided the match.

Under such circumstances it is not at all surprising that there should be a disposition on the part of the New York teams to stay out of matches where by the conditions they are doomed to almost certain defeat. This indisposition to enter into competition is significant, for once crush out the desire to measure effort in friendly rivalry with fellow-workers, and soon the whole subject of butt practice will die out despite all the general orders that may be issued to bolster it up. Competition is life and rivalry is vital in this matter, and if the men of one section are weighted down by an antiquated arm, they must soon cease to use it as anything more than a dummy with which to go through the manual of arms, and one of the most valuable lines of endeavor on the part of the soldier is cut off.

It may be urged that the cost of rearming such a large force as the entire National Guard of a State is too great to be lightly incurred, and then there is the risk that the work may be, after all, but temporary. There is no knowing when the time may come that shall see an invention which shall sweep away our entire small arm system, and there is a continuous line of improvement which makes the winning weapon of to-day the discarded arm of to-morrow. Still this is no excuse for absolute inaction, and a start, at least, could be made toward the better arming of the men by the issue of a limited number of rifles which are beyond question, and by general consent, superior to those now in use. They might be placed in the hands of the men best qualified to appreciate and use them, and their possession would come to be looked upon as in some degree a badge of proficiency in one of the soldiers' duties. It would not require such a great outlay to issue enough of these improved rifles to enable all the official scoring under the State orders to be made with them, and so show the men at their very best.

Of course, for a great majority of the work which the National Guard may ever be unfortunately called upon to perform, the present arms are amply accurate and deadly. It is quite enough for a mob of riotous citizens to know that the blue-coated young men marching against the disorderly ones are armed, even though it be with .50-caliber rifles, which may not shoot above an average of inners at the long ranges. Across the street, or at the distance of a block away, they are quite accurate enough to render a deadly fire, and they will be the more deadly, and, therefore, the less likely to be called into use in proportion as the men can handle them with certainty. Yet an essential point is to keep the interest of the men up to the highest point, and this can only be accomplished by letting them feel that their personal endeavors are not set at naught by the inherent defects of the instrument in their hands.

That there is a feeling in the matter among the National Guard is shown by the expression of opinion on the part of Company C, Seventh Regiment, N. G., S. N. Y., where, at a recent meeting, resolutions were passed, as shown in the following synopsis:

The rifle with which the National Guard is at present armed will not carry accurately more than 500 yards. In all matches at Creedmoor and elsewhere whenever our National Guard are called in competition with those of Pennsylvania, New Jersey, and other States, they find themselves heavily handicapped, their opponents being furnished with a much better arm. The late International Match and other matches have created a spirit of emulation in our National Guard that in our opinion should be fostered by the State; this can only be done by arming us with the best rifle procurable. The ex-

starts suddenly, with hoarse cry, from a secluded nook by the water's side, and lazily flaps away, with its long legs sticking straight out behind; and the ungainly water turkey or snake bird sits awkwardly on a limb projecting over the stream, tilting back and forth in vain efforts to balance itself. Its long neck is raised, pecking about in every direction, seemingly undecided whether to drop to the water or take flight. Black bass, sunfish, sheepshead and gar-pikes, with an occasional alligator, can be plainly seen swimming along in the clear, white water.

Returning to the Rambler we put back to Bayport and up the coast, ten miles, to Chessowicksee River. This part of the coast abounds in masses of black rock, called "nigger heads," for which the cruiser must keep a sharp lookout or he will continue to be so, as they crop up within a few inches of the surface. This river, as do most of the streams in this section, rises from a large spring. Some of the rivers of the interior suddenly disappear under ground, and most probably they reappear at the surface through these springs. At the mouths of the rivers are numerous oyster banks where sheepshead and drum do mostly congregate. Ten miles further north we come to Homosassa River, and following the tortuous channel at its mouth we anchored a mile from the Gulf. The Homosassa is a beautiful stream, unlike most others on the west coast. It rises from two large springs, and seems to have forced its way suddenly and with great violence toward the Gulf, cutting its way through the rocky soil by numerous channels, leaving many islands of coralline rock crowned by cabbage palms, for the last four miles of its course.

The next morning we sailed up to the charming resort of Capt. A. E. Jones, four miles from the mouth of the river. This is the most home-like hotel in Florida, and under the able management of Capt. and Mrs. Jones has become a favorite winter resort for many Northern sportsmen and their families. There are two long buildings with spacious and comfortable rooms, all on the first floor, shaded by verandas, and facing each other, with a beautiful lawn between adorned by orange, lemon and fig trees, with the beautiful river and mangrove groves in the rear. It is really the home of Mr. Yule, who was abandoned and burnt during the war; the large sugar plantation adjoining, with its mills and machinery, being also deserted and destroyed and permitted to lapse into a state of tropical wildness. The fine fishing and hunting at this place is so well known, having often been described in *FOREST AND STREAM*, that I will not dwell upon it here; suffice it to say that we went out one day with Mr. Giles and Mr. Curtis, and saw how they made a fine sport, but I will not say a mile from the hotel, where I killed my last deer in Florida, a young deerhound belonging to Mr. Giles. We went to the springs at the head of the river in the schooner without difficulty under the pilotage of Mr. Curtis. They are similar to the other river springs of this section, but the river itself, I think, is by far the most beautiful. To those wishing the comforts of a home while enjoying the fishing, shooting, boating, sub-tropical scenery and climate salubrity of the Gulf Coast, I would say, by all means go to Homosassa and put yourselves under the hospitable roof of Capt. and Mrs. A. E. Jones, whose efforts to secure the comfort and well-being of their guests are untiring and proverbial, and moreover, you will there meet with some of the best people of the North, to associate with whom will be one of your greatest pleasures.

One night while anchored off the wharf of Capt. Jones I was awakened by strains of melody floating over the water, and turning out I beheld several large lights floating down the stream above us. Soon I discovered it to be a long raft of cedar logs being poled along by negroes, whose dusky forms were brought out in strong relief by the blazing fires of pine-knots in hoop iron baskets, and whose clear and musical voices, singing their boating refrains, had been softened by distance and borne along the surface of the water by the sea breeze.

The next day we were anchored near the mouth of the river, laying in supplies. Skipper was in the dingy tending oysters. Squire was standing on the cabin roof watching for ducks and shore birds. Jack had gone ashore in the canvas boat to shoot snipe, while I was catching sheepshead. A sudden blow of wind sent the foresail sweeping over the cabin roof, the boom striking Squire and snipsheds and sent him sprawling on the deck. I seized the conch-horn and a terrific blast to attract the attention of the boatmen, for the scene was too good to enjoy alone. Jack and Skipper looked over just as Squire emerged upright with the water up to his shoulders. Jack, taking in the situation at a glance, shouted:

"Great God! I'd rather be  
A Pagan suckled in a crested woman;  
So might I, stretched on my deathbed lie,  
Have glimpses that would make me less forlorn;  
Have sight of Proteus rising from the sea,  
Or hear old Triton blow his wreathed horn."

### MUSICAL FROGS.

SOME time ago you printed a note from one of your many observing contributors in reference to certain musical frogs.

It reminded me that one night last summer while drifting with the tide up the Potomac, a dead calm having fallen upon us, I thought I heard instrumental music on shore just above Mount Vernon. The soft tinkling rose and fell, increasing and diminishing, while at times the sweetest strains floated over the water, as if an opera of fairies was rendering the sweet silver notes nanking and delightful swells and cadences, as my rapturing being quiet reverenced the artists somewhere in the shadowy distance. At one time there was a good imitation of the "Turkish Patrol," the crescendo and diminuendo being marked, starting with soft tinkles, increasing to a full chorus, and ending with delicate cadence. Finally I discovered that the musicians were frogs, and all in a little space of an acre or so near shore where, where the grass was not entirely covered by the tide.

The frogs may be well known, but I never heard any that made that kind of music before, though I generally hear them all, from *hyas* to *pipiens*, from those that tune up almost as soon as the song sparrow in the spring, to the rum-jug-o-rums of the summer, J. C. B.

### EXPERIENCE OF THREE AT REHOBOTH.

A PARTY of congenial souls had congregated at the corner grocery in the town of Rehoboth, Delaware, one evening in the early part of last December, and while sitting around the stove toasting their shins, and recounting their gunning and fishing exploits, the subject of duck shooting was introduced by Silas Merrihew, an enthusiastic lover of the rod and gun. "Boys," said he, "I've been seriously thinking of spending a week among the ducks. It is an entirely new diversion to me, and something always has been so. Now, one of you two, if you will accompany me, the thing is fixed. We'll have lots of fun, and probably bring home enough ducks to convince our friends that we did not purchase them. Who will go?"

Tom Stetson and Harry Wilson declared that nothing would suit them better, provided that good partridge shooting could be had in the neighborhood of the ducking waters. As each was the possessor of a well-broken setter, they naturally desired to spend some off-time at their favorite sport.

A place was next to be decided on. Barnegat Bay and Gunpowder River were condemned on account of the last mentioned requisite being lacking. Rehoboth Bay, on the southeastern coast of Delaware, was unanimously chosen as the place offering the greatest inducements. A letter was forwarded by the next mail to John Martin, a farmer living within a short distance of the bay, who accommodated gunners with boarding and lodging for a consideration, and throwing in the use of his decoys and services as boatman, notifying him they would be there either on Monday or Tuesday evening of the following week. It was finally decided that they should start on Monday.

Accordingly the trio, with their dogs, guns and ammunition, left C. early on Monday morning for Rehoboth, via Wilmington and Harrington. The trip to Lewes was devoid of interest. Here the railroad facilities ceased. Rehoboth is situated about eight miles southwest of Lewes. To cover this distance they had either to walk or engage a team, as they had not definitely stated in their letter what day they were coming, and Martin, of course, was not there to meet them. Inquiry of a native elicited the information that for \$6 he would hire them a conveyance and send a driver along. His proposition was accepted.

Calling a genuine Delaware darkey to him, he said: "Pete, you go down to the stable and hitch up the bays and take these gentlemen over to Jack Martin's." In a short time the "bays" were driven around to the station.

And what a team! A pair of mules, whose appearance indicated a propensity for airing their heels and perpetrating all the tricks peculiar to the race, were harnessed to a rickety old open-topped wagon.

Harry W., whose avoirdupois was over 255 pounds, looked at the vehicle dubiously, and then asked the proprietor if he hadn't a cart and a pair of oxen handy, as his party wasn't much on style, and didn't want him to send his best rig that distance. Pretending not to see the point, the man answered:

"Oh! that's all right, stranger, I s'uss like to give my friends the best. Won't you step over to the hotel and hev sumthin' before you go?" Declining his offer, they mounted the vehicle and ordered the driver to drive on. As they moved off the proprietor halted. "Now you be damned careful, Pete. Them mules be chuck full of oats and fed mighty spunky." They had not been long on the road before a trace parted. It was spliced with a piece of rope, and again everything was lovely.

"We're getting tawny now, we are," exclaimed Pete as the mules broke into a trot. "These yar animals are sumthin' on the git up and git, I tell yer." Hardly had the words escaped him when Wilson, who had been sitting on the seat, was observed to suddenly turn a flip-flop and alight in the sand on the roadside. Before his friends could divine the cause of this strange maneuver, they were all dumped in a heap alongside of their fallen comrade. The darkey was the first to take in the situation. "For to goodness, if de lynch pin ain't gone and dropped out." Such was the case. He was sent back to find it, while John and Silas righted the wagon and replaced the wheel. Harry meanwhile held the mules. A post soon returned with the lost lynch-pin. It was securely seated and once more the party were en route.

The mules had been very meek and well-behaved under these trying circumstances, and no trouble with them was apprehended. But alas for our friends' confidence in mule flesh! When about three miles from Martin's the off mule, evidently becoming tired, quietly lay down in the middle of the road, and no amount of persuasion could induce him to get up. This sort of traveling was becoming monotonous. It was how almost dark. Something had to be done, and very soon at that. While they were consulting as to the best means for raising the refractory mule, a smile suddenly illuminated the countenance of Pete, who exclaimed: "I know what will fetch him; he's awful afraid of a gun. S'pose we all git in de wagon, and one of you gentlemen shoots off his gun, and then he start his back up. When I didn't thought of dat afore." They satated themselves; Pete gathered the lines; John inserted two shells, raised his gun and fired both barrels. With a bound the mule sprang to his feet, and the circus then began in earnest. The near mule had remained quiet up to this time, but now took a hand in the performance. They reared, plunged and kicked. It was a ludicrous sight to see Pete dexterously avoid their heels. The harness, fortunately, held the car-stricken animals to the wagon, and the two drivers were free themselves futile, started off at a spanking gait, and without further adventure the tired and disgusted Nimrods arrived at John Martin's, having been three and one-half hours in making the eight miles.

A man was standing at the door of a rather comfortable-looking farm house, and as the team stopped in front of the gate he came forward and inquired, "Be you the party that has comin' in here to-night?" "Yes," answered the gentlemen. "If I'd a know you fellows was comin' to-night I'd a had a team down to Lewes and hauled you over; your letter didn't say what day to look for you. Howsomer, the old woman'll soon have supper ready. Here, Jake—" turning to a young man, whom he afterward introduced as his son, "take these gentlemen's dogs and put them in the stable." He then led the way into the house, where they were soon seated before a roaring wood fire.

Presently Mr. Harry Wilson, after being introduced, he announced that supper was in waiting, and "would the gentlemen be kind enough to step into the dining-room?" What a feast was set before these hungry sportsmen! Cold roast duck, broiled quail, fresh white bread, steaming hot

coffee, and different kinds of sauces. After partaking heartily of the repast, they adjourned to the sitting-room.

"Mr. Martin," inquired Harry, "what are the prospects for duck and partridge shooting?"

"Gentlemen," answered Martin, "I'm afeard you've left it too late for ducks. The bay is all frozen over, so you can't snuck up on the ducks. Your only chance is to lay fur 'em at night, and shoot into 'em as they fly over the pint for the fresh water pond beyond. It's froze over, too, but there be air-holes where the ducks can get fresh water to drink. They allers go there at night. Soon as ever the moon gets up you won't have much trouble in bringing some down. As fur partridges, there's plenty of 'em, but takes my advice, and when you find a covey, give 'em both barrels as they're up, 'cause ten to one you won't see 'em again. They make straight for the swamps, and the devil himself couldn't hunt 'em there."

"Boys," said Silas, "suppose we try the ducks to-night? We might as well have a little fun before turning in." The proposition was agreed to, and in a short time they were en route for the "point" above alluded to, accompanied by John Martin. The point proved to be a narrow strip of land projecting some distance out into the bay, and on which the Martins had erected a blind, sufficiently large to accommodate four or five gunners. Our friends took possession, and anxiously awaited the first appearance of Luna. As the ducks flew overhead their forms could be dimly outlined, and it was with some difficulty that Martin could restrain the excited sportsmen from opening fire. "Now, just hold on a bit, and don't waste your powder and shot," said he to Harry as the latter was on the point of raising his gun. "You'll hev all the shooting you want very shortly."

The time dragged wearily along, but at length the scene changed from darkness to moonlight. "Harry, you take the first shot," said Tom. "Get ready," whispered Martin, "here comes a bunch." He put up the gun, and when the birds approached within shooting distance, gave them both barrels. "I didn't hear anything drop," laughingly exclaimed Silas. "I guess you must have forgotten to put shot in your partridges. Now, Tom, your turn next. If you miss, I'll see if I can stop them a flock of eight ducks, soon come in range, and with the report of Tom's gun two birds fell, and as the others flew by, Silas gave them a parting shot, killing two more. "Just give me another chance, and I'll show you what duck-killing is," exasperatingly ejaculated Harry, as the others chaffed him on his misses. "Well, here's your chance," said Tom, as two more were reported coming toward the blind. Now, redeem yourself, Bang bang! "There comes one, anyhow. Clean shot that," shouted H., exultantly. "By George, he's only wounded, and is making for the ice."

The thought never occurred to give the wounded duck another load, but rushing from the blind he started in pursuit. The bird gained the ice, Harry close behind. Crash! He had stepped upon the ice, which, not being more than an inch thick, broke under his weight, precipitating him into the water below.

Scrambling to the shore, he returned to the blind. "Did you get the duck?" asked his companions. "No, blast the duck, but I've got an infernal good ducking. Guess I'll go up to the house and borrow some of Mr. Martin's old clothes."

Silas and Tom concluded to remain awhile longer, as the fun was just commencing. After enjoying the sport for upward of an hour, and securing twenty ducks, they too, returned to the farmhouse. There the three ducks Harry squeezed into one of the old man's suits, looking the very picture of despair.

"I want it distinctly understood," said he, "that duck chasing for me is played out. I'll fill the next one full of shot that tries to get away."

The forenoon of the following day was devoted to partridge shooting. The dogs worked excellently, and quite a number of the birds were found. Two were shot, but one killed when flushed sought safety in the swamps. Don and Nig followed and pointed, but the gunners could not approach. Indeed, H. endeavored to do so once, and became so imbedded in the mud that his friends experienced great difficulty in extricating him. Notwithstanding this discouraging state of affairs, they succeeded in bagging thirty for one morning's work.

After partaking of a hearty dinner they turned their attention to cleaning their guns and putting everything in readiness for an evening with the wildfowl. The old man and his son entertained them with recitals of some of their marvelous gunning exploits. It was amusing to behold the countenance of Tom, as Mr. Martin, Jr., related the greatest feat of his life in long range shooting. Said he:

"I had 'bin gunnin' for ducks and had got 'bout as many as I could stand, when I spied comin' my way six geese. I dropped two cartridges of big shot into my gun, and waited. Presently they come a little nearer; I honked and they honked, but darn if I could git 'em inside of a hundred yards. 'Thanks I, 'Them birds are goin' to light out pretty soon, so I'll cut loose on 'em anyhow.' I puts up my gun and blazed away. You oughter see the feathers fly! I thought that's 'bout all the damage I'd done, but, as true as my name is Jack Martin, then six geese dropped, one after the other, some dead. 'That's what I call pretty tall shootin'!' Although his listeners felt that the story was gotten up for their especial edification, they nevertheless agreed that it was a remarkable shot and one worthy to be placed on record.

About 9 o'clock the party were again within the blind. The ducks began to move, affording some excellent shots. H.'s nervousness had worn off, and he scored five more birds than either of his companions. The fusillade continued until 11 o'clock. Upon counting the result, it was ascertained that thirty-five ducks and three geese had been killed. Highly elated they returned to the house and were soon wrapped in the arms of Morpheus.

It is hardly necessary to detail their actions during the remaining four days. Each day's shooting was but a repetition of Tuesday's. When they arrived in the village on Saturday evening, they divided the game that had not been retimed among some consumption among their friends. H. enjoined his companions to secrecy regarding his various mishaps. But somehow they all leaked out, and now he is asked whether he caught his ducks or shot them.

OCCEANICAL.

NEBRASKA.—Falls City, Neb., March 6.—Since the ice has begun to melt we have been having fine duck and goose shooting on the numerous lakes in this immediate vicinity. Squirrels, rabbits, etc., are plentiful. Quail wintered in this section well, though undoubtedly a number were frozen.—Tyro.

## Natural History.

### THE YELLOW-BELLIED WOODPECKER.

Picus.

I SEE as with "the spect of prophecy" that the FOREST AND STREAM is destined to be an encyclopedia of natural history, and the only one in the English language. To sustain that reputation is only necessary that the sportsman-naturalist and compiler of facts, unite their efforts on this common or neutral ground. The sportsman must rise to the plane of the naturalist, then both must be lifted from savage to civilized life, while the compiler must come down from the high stool he has mounted, and in a manly way acknowledge his indebtedness to the others, and to the labors of other men. The sooner this is done the better for all parties, since it is plain that the sportsman (today now carries into the woods the highest grade of intellect, which, fired with the excitement of the chase, gives life, interest and humor to a narrative that no tarry-at-home, however sentimental or scientific, can reach. I would not be considered meddling or inclined to "thrust my nose" into other men's business, but I often read an article in this paper to the significance of which I might possibly add a trifle, and the same amount perhaps to its value as an historic record. My object is simply to preserve strong points of character frequently overlooked, and which, once true, are forever true, in the orders of life below us.

In running my eye over the list of "Birds of Maine," substantially the birds of New England, I noticed that the yellow-bellied woodpecker was passed over with a few words, just what every author gives the bird, showing most conclusively that ornithology as a science had not at all reached his character, habits and peculiar instincts. I am obliged to set down first, that this is the most destructive bird in our climate. I have seen the best trees in an apple orchard destroyed, while the owner looked sadly at the trees ceasing to bear and dying, not once dreaming that so small a bird could cause it. "Sometimes collect a sap sucker," falsely so-called. *It has no sucking apparatus.* Boring for worms is often asserted and stoutly defended. False again, he never bores a wormy tree, and besides he has no barbed tongue like his tribe for pulling out a worm when he gets almost to it. Still worse, he kills a tree leaving no mark of his bill on the wood equal to the scratch of a pin. Then what under heaven does he do?

Well, he kills the tree most certainly. I have seen the white birch cut off, or rather broken off, twenty feet from the ground, in more cases than I can number, all his work. I have seen the yellow birch destroyed in the same manner; branches of the tree cut off, shriveled branches struggling for life, but dying. I have seen a tree girdled with spots twenty feet from the ground, then again a few feet lower, then below that, repeating the process to the roots, leaving dead and dry sections above each hole. I have seen the white pine destroyed in the same way. I have seen an elm tree eighteen inches in diameter, whose trunk of twelve feet was spotted with "gimlet holes" in the bark nearly one inch thick, and where for ten summers past I have shot the pests and thereby saved the tree. But this was a "honeydew" class, of thicker, darker, greener foliage than hundreds of others in the neighborhood, and from the tips of the leaves a drop of sticky liquid fell, just as a name.

What other crimes against property this bird may be guilty of, I leave others to discover. What I have seen any one can see if they have the same opportunity. The bird crowds closely the snow line in its northern migrations, and although leaving his "trade mark" on many trees, does little damage in Massachusetts. But further north, where the bird breeds, white orchards are severely injured, if not destroyed, by them. In such a tree can be found without enlargement for some distance of the sap. In that case the wound in the soft inner bark would grow over, while the rough outside bark would show the holes ever afterward. The first impression might well be that sweet-apple trees would be selected, but the rule is not reliable, since the sour, "puckery," crab-apple seldom escapes.

The bird begins its operations early in May, on the smooth, green, healthy bark of a tree just beginning to bear fruit, and just as the bark swells out with the soft pulp for the year's deposit of wood. With true philosophy he invariably begins just below the offshoot of branches, where the upward flow of sap is retarded by knotty fibers above, and where the accumulation presses, causing the sap to flow more freely than at any other place. If the taste is satisfactory he begins again, then returns to the first, lapping out the sap with a tongue fringed with hair on both sides, meeting at the point. This is the key to all his eccentric habits. Thus alternately pecking new holes, and lapping out those already made, he soon girdles a tree with bleeding wounds. Then perhaps flies off to other trees picking bugs and worms from the bark, but soon returns to the flowing sap where three-quarters of the day is spent. If the heat of summer dries a hole he at once enlarges it, laterally, causing it to bleed afresh. Thus by a process constantly intermittent, the work is carried on often by a whole family in turn.

In this way the holes approach each other till the flow of sap is so diminished that the leaves fade and the fruit withers on the stem or falls to the ground. Perhaps half the apple trees attacked by this little frightful, but not otherwise invariably destructive, bird, are injured, and in every possible degree, from the round gimlet hole, which is not fatal, to the broad "countersink" which kills the branch or the whole tree. I must allude here to the fact that when the woodpecker leaves the tree, a hummingbird invariably drops down from a twig on which he has been waiting his turn, thrusts his tongue into the holes in rapid succession and starts off the next minute.

I think the reader will acknowledge my first assertion sustained, and also that this species is misnamed "a sap-sucker," although at a certain season sap is a prime article of food, and that he is more of an insect than a worm eater, lacking the necessary machinery for reaching worms in the true picarian style.

To return to introductory remarks I trust the sportsman naturalist will not feel that he has been treated with disrespect in natural history is beneath the dignity of the sharpest intellects in society. The subject is not yet exhausted, there will be for many days to come. Another thing, there should be a free interchange of thought among writers. A postal card will ask and answer many questions where the record of a fact has obscure points. My skull is thick as a board, I acknowledge; yours may be in spots; in any case

let us be neighborly and abolish fictitious names. Record every natural fact that comes under your eye, even at the risk of feeling the clerical have more than once felt on finding what I supposed new to the world was new only to myself. One thing further, let no man expect to see all these things in a minute. The experiences of a lifetime, and the fruit of its researches are often embodied in a single page of record, and it is only from a great store of incident that we can sift what is reliable, and separate the true from the false.

A word of explanation for using *Picus*—There is in ornithology substantial agreement as to genera, while species and variety afford a boundless field in which young ambition spreads itself with wonderful effect. Distinctions

CRAB-APPLE TREE KILLED BY YELLOW-BELLIED WOODPECKER.

without differences, as synonyms fully demonstrate, have been multiplied about as long as it will pay. I herein give a "difference" in this bird without a "distinction," and throw the gate wide open for my friends above referred to to step in and reach "immortality" by a shorter cut than usual. Give us, please, a term (not as long as your arm) embodying some idea of its character and habits, else we must give it up, and fall back on yellow-bellied wood—no—black-pecker, very near the place from which we started.

B. HORSFORD.

SPRINGFIELD, MASS.

### WINTER BIRDS.

AROUND Boston this winter there has been an unusual flight of birds, especially several species that have not been seen in its vicinity (excepting a few scattering specimens) for at least fifteen years. Several birds have been taken here during the past three months that have never before been known to pass the winter here. For instance, I know of an authentic case of the taking of two cowbirds in the middle of winter. Although the season has been severe, robins, song-sparrows, bluejays and yellow-rumped warblers have stayed in this vicinity in greater or less numbers. I saw a red-winged blackbird the 17th of February, and bluebirds arrived before the 1st of March. I have taken many white-winged crossbills and pine grosbeaks, but the American crossbill has been scarce. On the 22d of February I shot forty redpolls out of one flock, about thirty of them being Greenland or greater redpolls. Redpolls have been here in great numbers, and snow-birds and shore-larks are frequenting the seashore in large flocks. On the 24d of February I saw an Ipswich sparrow, which was shot by a friend accompanying me. Thinking this a remarkable winter in regard to the number of birds visiting us, I have deemed it worthy to write to you about it.

W. A.

BOSTON, March 7.

I here send you a list of birds observed during the winter months, as follows: Robin, *Turdus migratorius*; bluebird, *Sialia sialis*; black-capped chickadee, *Parus atricapillus*; white-bellied nuthatch, *Sitta carolinensis*; cedar bird, *Amphispiza bilineata*; pine grosbeak, *Pinicola enucleator*; American goldfinch, *Chrysomitris tristis*; song sparrow, *Melospiza melodia*; chipping sparrow, *Spizella socialis*; English sparrow, *Passer domesticus*; crow, *Corvus americanus*; downy woodpecker, *Picus pubescens*; red-headed woodpecker, *Melanerpes erythrocephalus*; golden-winged woodpecker, *Colaptes auratus*; screech owl, *Scops asio*.

CAD. OLIVER.

SIOUX FALLS, S. D., Feb. 25.

A friend of mine shot a high-hole on January 25. Another high-hole was seen at Woodside a couple of weeks ago. Robins and a few meadow larks were in the woods in winter, and several large flocks of meadow larks and fox sparrows have appeared during the past week. A large white owl was seen by a friend at Locust Valley on January 25. I have heard of three being killed in this neighborhood during January. Will you please inform me if the horned lark, about which an article appeared in your last issue, and the lark bunting, abundant here during the winter, are the same?

LOUISIANA CITY, Feb. 26.

A pewee (*Sayornis phoebe*) was observed here to-day, an unusually early date for the arrival of this species. G. MELFORD, CORNELL, Feb. 8, 1883.

### THE BIRDS OF MAINE.

With Annotations of their Comparative Abundance, Dates of Migration, Breeding Habits, etc.

BY EVERETT SMITH

#### FAMILY RECURVITROSTRIDÆ: AVOCETS AND STILTS.

214. Avocet—*Recurvirostra americana* Aud., Ridg. 566. Cs. 600.—Accidental visitant from the West. Rare. Several specimens have been shot on the eastern shore of the Bay of Fundy at various times, and sent to a taxidermist in St. John, N. B. One was killed at "Simonton's Cove," Cape Elizabeth, Cumberland county, Maine, November 5, 1878, and its skin is now in the collection of the Natural History Society of Portland, Maine.

215. Black-necked Stilt—*Himantopus nigripes* Aud., Ridg. 567. Cs. 601.—Accidental visitant from the South and West. Very rare. Mr. Boardman has recorded a specimen taken near the mouth of the St. Croix River in 1862. Mr. Montague Chamberlain has recorded (Bull. N. O. C., April, 1882) the capture of a specimen by Mr. John C. Gills, at Mace's Bay, on the eastern shore of the Bay of Fundy, in September, 1880. The species is rarely found on the New England coast.

#### FAMILY PHALAROPIDÆ: PHALAROPES.

216. Red Phalarope—*Phalaropus fulicarius* Aud., Ridg. 563. Cs. 604.—Not uncommon along the coast during migrations. Mr. Boardman reports that "some breed" in the region of the St. Croix River. Mr. H. H. Hildreth, of Brewer, Maine, informs me that a pair, male and female, were shot at Hermon Pond, Penobscot county, in May, 1881, and they were probably there for breeding purposes, although the spring migration occurs in May and these birds may have been merely stragglers from the coast.

217. Northern Phalarope—*Lobipes hyperboreus* Aud., Ridg. 564. Cs. 603.—Not uncommon along the coast during migrations. Probably a few breed on the outer islands, but I have observed phalaropes, probably of this species, at sea near our coast in June and July. The phalaropes are locally termed "sea geese" by fishermen and others. I have failed to learn the origin of this very inappropriate name for birds that most resemble in size and form the small sandpipers, although their feet are partially webbed, and they are swimmers more habitually than waders when found near our coast. "Rock old-quaw" is another and less common, local name, I have heard applied to the phalarope.

218. Wilson's Phalarope—*Lobipes wilsoni* Aud., Ridg. 565. Cs. 602.—Rare. I saw three phalaropes alight in the Noneseuch River, near "Black Rock," Scarborough, June 9, 1881. My companion, William H. Stephenson, Esq., shot one of these, and it proved to be of the species above named.

#### FAMILY RALLIDÆ: RAILS.

219. King Rail—*Rallus elegans* Aud., Ridg. 569. Cs. 676.—Rare. The only record of the occurrence of this species here for which I can vouch is that of a single specimen, shot by my friend Albert G. Rogers, Esq., at the Sparhawk River marsh, October 1, 1881, the skin of which is preserved in the collection of the Portland Natural History Society.

220. Clapper Rail—*Rallus corymbosus* Aud., Ridg. 571. Cs. 673.—Rare. An occasional visitant from the South. Specimens have been taken at various times on the coast, and one was shot at "Sedgwick's Pond," Androscoggin county, in 1874, by Mr. C. F. Nason, of Auburn, Maine. For this sole inland record I am indebted to Prof. J. T. Stanton, of Lewiston, Maine, in whose collection the skin is preserved.

221. Virginia Rail—*Rallus virginianus* Aud., Ridg. 572. Cs. 677.—Not very common. Breeds. Formerly abundant but apparently not very common during the last few years, excepting in the autumn of 1881, when rails of several species were remarkably abundant here.

222. Carolina Rail, Sora Rail—*Ortygma caroliniana* Aud., Ridg. 574. Cs. 679. Common. Breeds. Abundant in favorite localities during September and October.

223. Yellow Rail—*Ortygma pusilla* Aud., Ridg. 575. Cs. 680.—Not uncommon but very rare. Breeds. Breeds.

224. Jamaica Rail, Black Rail—*Porzana jamaicensis* Aud., Ridg. 576. Cs. 681.—During the autumn of 1881 great numbers of Carolina rails were shot in the vicinity of Portland, Me., as also numerous Virginia rails and yellow rails, and a king rail. Upon the fourth of October, while my friends, Jonas Hamilton and Albert G. Rogers, of this city, were shooting in Scarborough, Mr. Boardman's father shot a Carolina rail, a black rail, and a yellow rail. The bird was probably of the species *Porzana jamaicensis*. Both gentlemen have a familiar knowledge of our common species of rails, and especially noted that this bird differed from the "sora" or Carolina rail and the yellow rail in form as well as in plumage. Unfortunately the specimen was not preserved, and it may possibly have been an instance of melanism of the yellow rail.

225. Purple Gallinule—*Gallinula porphyrio* Aud., Ridg. 578. Cs. 685.—Accidental visitant from the South. This species has been recorded as of occurrence as far north and east as New Brunswick (v. Bull. N. O. C., July, 1881, and April, 1882).

Mr. Boardman mentions it in his list of the birds found in the vicinity of Calais, Maine. Mr. H. A. Purdie has recorded (Bull. N. O. C., v. p. 242) the capture of a bird in 1877 near Boothbay, Maine, by Mr. Jos. G. Nickerson. This bird was "taken alive and afterward escaped."

226. Common Gallinule, Florida Gallinule—*Gallinula chloropus* Aud., Ridg. 579. Cs. 684.—Accidental visitant from the South. Mr. Boardman obtained a specimen some years since that was shot in Calais, Maine.

227. American Coot—*Fulica americana* Aud., Ridg. 580. Cs. 686.—Not very common, but usually occurring in limited numbers during the autumn migration. But little known here, and the name *Pont de l'eau*, or water-hen, is not used in Maine.

I have heard it locally termed "blue peter" and "blue marsh-hen" in Maine. The name coot, properly applied only to this bird, is erroneously used in Maine, as well as throughout New England, to designate any one of the three species of surf ducks or scoters so abundant along this coast.

#### FAMILY ANATIDÆ: DUCKS, GESE AND SWANS.

228. Common Swan—*Cygnus americanus* Aud., Ridg. 588. Cs. 689.—Rare straggler from the West or South. An immature swan of this species was shot by Mr. Wm. Williams, of Boudoinham, Me., in the Kennebec River, near Brick Island, at the

junction of the Androscoggin River, known as "Merry-meeting Bay," in November, 1881.

229. Snow Goose—*Anser hyperboreus* Aud.: *Chen hyperboreus* Ridg. 501, C. 695.—Rare. Some years ago a flock of geese of this species alighted in the Nonesuch River at Scarborough, Me., and remained there undisturbed a half day. An immature specimen was shot at Glenburn, Penobscot county, October 28, 1881, and its skin is in the possession of Mr. E. S. Bowler, of Bangor. An immature specimen was shot near Hollowell, Kennebec county, November 25, 1881. An adult specimen was shot in Casco Bay, Cumberland county, in December, 1880, and its skin is preserved in the collection of the Portland Natural History Society. Geo. A. Boardman, Esq., has procured an immature specimen in the region of the St. Croix River. The three immature specimens above cited are probably referable to "variety alberta" (Ridg. 501a, C. 696).

230. Brant Goose—*Anser bernicla* Aud.: *Bernicla bernicla* Ridg. 505, C. 700.—Common; migrant along the coast, but usually passing far out at sea, hence not often shot here. Arrives late in April and early in May.

231. Canada Goose—*Anser canadensis* Aud.: *Bernicla canadensis* Ridg. 504, C. 702.—Abundant during migrations, arriving in numbers March 20. The spring flight continues until the month, but stragglers are sometimes seen late in May and early in June. In Maine the "variety alberta," which appeared to differ in no respect from the same "variety" shot in Dakota Territory. The Canada geese are usually termed "wild geese" in Maine, and no other species is commonly known here, except the brant geese on the coast. They vary much in size, and shades of coloration of plumage. The average weight of those shot here is less than eight pounds each, and ten pounds is an unusual weight. I caught the latter lower parts were of a light buff or cream color, the yellow being more vivid than the coloration of Audubon's plate in "Birds of North America," with which I made a comparison.

232. Mallard—*Anas boschas* Aud.: *Ridg. 601, C. 707.*—Not common. An irregular visitor, usually as a straggler associated with ducks of other species.

233. Dusky Duck—*Anas boschas* Aud.: *Ridg. 602, C. 708.*—Abundant. Many breed about the lakes and streams throughout the State, nesting upon the ground, and laying their eggs usually in June. In August the young ducks can be seen. In September the families associate together, forming large flocks. If not driven away, these ducks frequent the lakes and streams until ice obliges them to seek other resorts. The greater number migrate South to pass the winter, but their places are taken by more Northern-bred ducks, which spend the entire winter in considerable numbers along our coast.

The first spring migrants arrive here on their return from the South in the latter part of March, and the migration extends well into the month of May, being at its height during the earlier portion of April. Then they make a very brief halt on our coast at this time, but pass northward; the departing flocks being quickly succeeded by others, arriving with the migration continues.

The dusky duck is generally termed "black duck" in Maine as well as elsewhere along the Atlantic coast, although we have in great abundance the scoters (improperly termed "coots") which are black, and the dusky duck is brown and not black.

The "spring ducks," or those arriving from the South, may be distinguished from the "winter ducks," or those that have spent the winter on the coast of Maine, by the difference in density of plumage, especially of the head, compared with the general darker coloration of the heavier plumaged "winter ducks," as the gunners term them.

234. Sprigtail or Pintail Duck—*Anas platyrhynchos* Aud.: *Drifto platyrhynchos* Ridg. 605, C. 710.—Not common. A few seen during autumn migrations, but rarely in spring. Turned by local gunners "gray duck."

235. Gadwall Duck—*Anas strepera* Aud.: *Chalcidastanus streperus* Ridg. 604, C. 711. Very rare. Mr. Boardman has procured a single specimen. Two ducks of this species were shot at Scarborough, April 29, 1879, by my friend Mr. Ira Crocker, of Portland, Me.

236. American Widgeon—*Anas americana* Aud.: *Mareca americana* Ridg. 607, C. 713.—Not uncommon in autumn, but never abundant. Rarely appears here in spring.

237. Green-winged Teal—*Anas carolinensis* Aud.: *Nettion carolinensis* Ridg. 612; *Querquedula carolinensis* C. 715.—Common migrant. Most common in the autumn. Arrives early in April, and is seen in the autumn after all of the other migrants have passed by. Rarely abundant here.

238. Blue-winged Teal—*Anas discors* Aud.: *Querquedula discors* Ridg. 609, C. 716.—Common autumn migrant, arriving early in August. Sometime rather abundant. I know of but a single instance of the occurrence of this species here in the spring. The late Caleb G. Loring, Jr., shot one at Scarborough, Me., April 28, 1859.

239. Shoreline Duck—*Anas platyrhynchos* Aud.: *Spatula platyrhynchos* Ridg. 608, C. 718.—Rare. An occasional visitor from the South. My friend, James Hamilton, Esq., shot a fine adult male at Stratton Island, Scarborough, Me., April 7, 1879. Five ducks of this species were shot near Portland, April 18, 1881, and several more in the same vicinity two days later.

240. Wood Duck—*Anas sponsa* Aud.: *A. sponsa* Ridg. 613, C. 719.—Abundant throughout the State, except on the coast and in the mountains. Breeds usually in hollow trees. The eggs are laid in May, and the young birds fly strongly ere the expiration of July. Strictly a fresh-water duck in habits; this species is only found on our coast as a straggler, where it is occasionally shot in company with ducks of other species. The wood ducks and the dusky ducks are the only species of ducks that breed abundantly in Maine.

[TO BE CONTINUED.]

WILL OWLS KILL CROWS?—Onondaga, March 5.—On the 23d of February, while hunting crows and snowbirds, my rifle led me along the banks of what has long been known as the "Furnace Brook," south of the mill of Sprague, N. Y. Among the hemlocks fringing this stream, the crows, of late, have found a comfortable roosting place. In the early morning, these dusky birds take their flight eastward, seemingly in companies and battalions, under the guidance of appointed leaders. As the sun is about disappearing over the western hills, the sky is fairly darkened by these same birds, and they burn to the hemlocks. While hanging about in the neighborhood of the stream, I had abundant evidence that a conflict had recently occurred between a cat-owl and a crow. Here and there in the snow were visible impressions of the crow's wings where he had flapped

along, and following were the imprints of the owl's wings, here and there feathers of both, and blood upon the snow. Following this trail a short distance, I reached the spot where the owl had celebrated his triumph by devouring the greater part of his victim. For several feet around were black feathers, blood, pieces of crow's skin and numerous remains of the owl's meal in the snow. Doubtless the owl took advantage of the crow while sleeping among the hemlocks, and so fiercely pursued him that he fell a victim to beak and claw. This being my first intimation of owl feeding upon crow, I hope to learn more about it through the columns of your valuable journal.—G. ALBERT KNAPP. [We have in two instances known of the killing of the crow by the great horned owl (*Bubo virginianus*).]

MASSACHUSETTS BIRD ARRIVALS.—Brookline, Mass., March 9, 1893.—Having kept notes of the time of arrival of some of the birds in spring, as observed by myself, I send you the record from 1879 to 1883, inclusive, taken at my residence. Following at Newton, Mass.: 1879—February 20, robins; March 11, bluebirds. Following at Brookline, Mass.: 1880—February 25, bluebirds; March 6, robins; March 8, babblers; March 8, robins; March 8, bluebirds; March 10, robins. 1882—March 3, bluebirds; March 10, robins; March 19, woodcocks. 1883—March 2, bluebirds; March 4, robins. The above record for five years shows that in only one of the five have the robins come to us earlier than the bluebirds, viz., in the spring of 1879. The number of woodcock seen in the spring of 1882 led us to anticipate a good season for those birds, but when the season opened, August 1, there were but few robins to be found, and our fall flight of woodcock was an utter failure, as far as number was concerned. We shall look for their arrival now as soon as the weather moderates, March thus far having been as severely cold as any part of the past winter, and there being still several inches of snow on the ground.—C. T. D.

A EUROPEAN WOODCOCK IN CANADA.—The occurrence of *Scopula rusticola* in America is so unusual that every instance of its capture should be noted. Sportsmen should be on the lookout for this species, and if they find it lose no time in reporting the matter. The Canadian *Sportsman and Naturalist* says: "A specimen of the English woodcock (*Scopula rusticola*) was shot on the 11th ult. [November] by a French Canadian at Chambly, P. Q. Color, size and weight of the bird confused the man, who carried the stranger to Mr. Smith, a sportsman, and knew him, but he became incredulous—as we did when it was brought to us in the flesh—that a fat, twelve-ounce European woodcock could be obtained in Canada in November; but its freshness settled the doubt and the bird is now stuffed. We believe that this is the first specimen shot so far inland in Canada. The other record of a specimen occurring so far north on this continent is one taken in Newfoundland in 1866."

DRUMMING OF THE SPRUCE GROUSE.—Editor *Forest and Stream*: The drumming of the Canada grouse is performed exactly as I have related it in *FOREST AND STREAM*—the bird drumming while descending, in a very small spiral, from a limb overhead, and after strutting on the ground for about two minutes, flying back in the ordinary manner. I have seen this drumming only once, and only once over thirty years. Mr. Smith's account is quite new to me, and if correct, shows a very surprising difference in the drumming habits of different individuals of this species.—PESNOSCOT.

SPRING IN VIRGINIA.—Leesburg, Va., March 7.—Blackbirds, frogs croaking, robins, geese going north and other like signs have made us all think of fishing. The small boys have tried the succulent sucker, with some success, and older folks have caught the catfish. One of the latter has, however, nipped our plans in the bud. Flies called here "shad" were out by thousands on Goose Creek three weeks ago. These flies are, I think, the caddis flies, having four wings, only two showing when at rest, of a delicate lead color.—T. W.

TO ENTOMOLOGISTS.—We have been requested by its author to call attention to the following circular of inquiry concerning canker-worms:

U. S. DEPARTMENT OF AGRICULTURE,  
DIVISION OF ENTOMOLOGY.  
Washington, D. C., Nov. 1, 1892.  
SIR: In preparing a bulletin upon the subject of canker-worms, to be issued from this department, I find that much of our present information is of little value, and that the data for the preparation of two entirely distinct species of canker-worms were confounded in description, seasons, habits and geographical distribution. In many of the publications of the general public, and even in the reports of our own entomologists, the most widespread and best known species is the spring canker-worm (*Pteromalidella caryocarpa*, Peck). The female rises in the spring, and is active in the spring, and the male rises in the fall, and is active in the fall. The second species is *Limnodynastes pomatorum*, Harris, and the female rises chiefly in the fall, and lays her eggs in the spring. It is therefore, as you will see, that the two species are not as you possess, especially upon the following points, in regard to the occurrence of canker-worms in your own locality:

1. Which species, if either, is now found in your own locality, or has ever been found?
2. When was it first observed there?
3. During what years has it been especially injurious?
4. During what years has it been especially unnoticed?
5. Has the appearance of the perfect or imperfect insect been confined to either the fall or the spring, or has it covered both?

Wherever any doubt can or does arise in regard to the species observed, it is particularly requested that specimens may be sent to the department, and that the specimens be accompanied by a letter, signed by the contributors if a request to that effect is made; or boxes and stamps for the return of specimens will be sent to any person who will notify the department of intention to contribute information and specimens.

Observations may be made during all mild weather from the present month (November) until the middle of June next, and the results and detailed the observations the greater will be their value. If you have not the time or inclination to make these observations personally, you will confer favor by handing this circular to some person who will be interested.

Should this circular come to the hands of any entomologist, and he find it of interest, he will be glad to forward to the department information they may possess, that will throw light on the range and preferred food-plants of either. Respectfully,

C. V. RILEY, Entomologist.

THE SNIPE, THE SNIPERS AND THE SNIPER.—In reference to the snipe eating at a young man in town a week ago, we learn that the young man from Germany was fully posted, and sold the attempted snipers very nicely. He went out as a poor innocent victim in disguise, and when told to hold the sack the snipers replied, "Cave in, hold it, hold it all night." The snipe hunters then retired for a grand fusillade, and the young man from Germany also retired to town, informing his friend that he captured eight snipes on the road south of town. The snipe hunters on arrival in town supposed they had secured their prey, and they had indeed found the mountains or some place of shelter, but felt much chagrined on finding that he reached town before they did, and that they wasted a good deal of powder and lung exercise for nothing, excepting to scare away the snipe. Instead of the young man from Germany.—*Treka Journal*.

## Gauge Bag and Gun.

To insure prompt attention, communications should be addressed to the *Forest and Stream* Publishing Co., and not to individuals, to whose absence from the office matters of importance are liable to delay.

### MY FIRST PANTHER.

ONE Sunday afternoon I was seated in my tent on the banks of Bayou Bartholomew, some twenty-five miles below Pine Bluff, Jefferson county, Arkansas. I was engaged in deadening a tract of land for the purpose of opening a plantation. My laborers had all gone off for various objects, and I was left alone. Except my riding horse and pack of hounds there was not a living object about the camp, even my rifle and shotgun were not at home, having been loaned to some of the hands for still-hunting. It was about the middle of November, and the weather though cool was not disagreeable. I was employed in studying some (it ought to have been my Bible) township maps, as I was anxious to enter some lands adjacent to mine, when the son of a neighbor galloped up to the tent in great excitement.

"Colonel, oh, Colonel! papa has got a big panther up a tree on the cypress brake, not far from Couchart Bayou, and wants you to come quick and shoot it."

Now this was breaking the camel's back; my guns loaned out at a time when I needed them more than I ever did before. How provoking! no gun, and this the first opportunity ever offered me to shoot a panther.

"Ride to your uncle's, Sam, as fast as your horse will carry you, and request him to saddle his gun. I will saddle my horse and be ready to go on back with you. Perhaps by that time some of my workmen may return and I may get my own gun."

It was two miles to the residence of Mr. Price Copeland. He and his brother, William Copeland, were the noted bear hunters of the country. They were the early pioneers who settled on Bayou Bartholomew, in the southeastern portion of Jefferson county; but when the chain carriers when the lands were first surveyed, and were now widely known for their hospitality.

In a short time Sam returned with the gun, and when I looked at it I lost all confidence in its shooting qualities; yet it was the only chance, and I intended to kill that panther if I had to do it with my case-knife. My horse was ready saddled and hounds coupled to prevent their running after any game before I should get to Mr. Copeland; none of the laborers had gotten back, so I was forced to set out with the miserable excuse of a gun that Sam brought. It was quite dark when I left my camp. I was afraid some other bad luck would attend me before reaching Copeland. Our horses were put to full speed to keep the hounds from leaving the road and striking the track of a deer, turkey, bear or other wild varmint.

As we rode together Sam informed me "that he and his father had been over on the Arkansas River to Richmond, a small country store sixteen miles south of Pine Bluff, and the same distance from my tract of land. On their way home, after crossing Couchart Bayou, they saw a very large panther spring out of the cypress brake and cross the road. Fortunately several of their bear dogs were along, and they gave pursuit. The panther ran parallel with the road for nearly a mile, when it went up a tree on the side of the road. His father concluded to stay where he was, and let it up the tree until he should go after me; and if I were not at home, to go after a gun and return as soon as possible."

Fortunately I succeeded in getting my hounds to the tree in which the panther was crouched without their striking any trail.

"Furies and thunder and lightning, what kept you so long, Sam? Did you expect me to sleep out the night and you to come back in the morning?" exclaimed Mr. Copeland as we dashed up to him. "I explained the cause, the dogs, and this seemed to satisfy him. It was now 8 o'clock at night. He had sat on his horse under the tree not thirty feet from that ferocious animal for four long mortal hours to keep it from jumping out, and he was one of the most tired and fretful men that a person could imagine. While I was tying my horse to prevent his running off when I should shoot, I asked him how he managed to keep the panther from jumping. "Oh, I fastened him and the dogs, and everything else, until he was afraid to leap out."

My arrival with so many dogs seemed to infuriate the beast. I could hear him lashing his tail against his side and the deep angry growls, but I could not see him. His color and that of the leaves were so nearly alike that I could not make out his form until Copeland took my gun and pointed him out. I stood in front of Copeland, who was still seated on his horse, though he had not seen the animal. I kept him from jumping on me when I shot, as this was not his hunting horse. I was perhaps some ten feet in advance of Copeland. With many misgivings as to the certainty of that gun's killing the panther I fired a random shot. With the report I felt a rapid movement of the air just over my head and next angry odors from Copeland and a yell to the dogs to seize him. When I shot, the panther leaped out of the tree, evidently with the intention of springing on Copeland, but disabled by his severe wounds he fell short of its object and lighted on the rump of the poor horse, most fearfully lacerating it with its fore claws as it struck the ground and then it bounded into the thick cover followed by all the dogs. Running some hundred yards it mounted a small, bending sapling, and when Copeland and myself got to the place we saw it hanging with its fore feet while the hind feet swung clear. I fired the second barrel, and by the time it fell to the ground it was seized by the dogs and Copeland plunged his knife to the hilt in its side behind the shoulder, before it could do much injury to a dog.

On our way to our respective homes, Copeland asked me "had I ever eaten any panther meat?" Replying "no," he said, "it was the sweetest of all flesh he had ever eaten, and if it was willing, he would come over to my camp the day after the next day, which would be Tuesday morning, to have a regular barbecue. To that day I readily consented. Before separating, near the head of the cypress brake, not a mile from Copeland, the dogs flushed a large flock of turkeys. "Now," said Copeland, "you come out here early to-morrow morning, and kill a turkey, and perhaps you may get a fat doe also. I saw a track of a bear going into the cane brake just as I crossed Couchart, and I know where he will be to-morrow; I price and I will go after him. I am fully sure to kill a regular bear, and then I will send you how to capture, which you will declare the finest eating you ever had of wild animals. When you return from hunting the turkeys

gator teeth, two young bald eagles alive, live gators, photographic views, etc.

Across the river Mr. Wheeler, of Templeton, Mass., is collecting birds and curiosities for Maynard of Boston. Each boat day brings a large assemblage of yachts to our wharves to take visitors up or down the river. Many of them are boats of small capacity, while the large boats of last year are engaged in Government employ or longer voyages with freight. Capt. Hancock, with the *Ima*, is repairing the houses of refuge along the coast. The Pennsylvania, Capt. Bowers, has a Government survey party; the Illinois, Capt. Hendrickson, is carrying lumber to the light-house at Jubiter, and bringing up pineapple slips from Key Largo and banana plants from Lake Worth.

The Rambler, that took Mr. Henshall's party round to the west coast last year, has not returned. We welcome to our waters the new nonpareil sharpie *Seminole*, Com. Douglas, which came in at Indian River Inlet two weeks ago, and is lying at Jubiter. Also the New York, a new yacht, built at Jacksonville and run in at Mosquito Inlet and through the haul-over to Indian River. She will start on a cruise down the river soon. We propose to haul our sailboat over from the St. Johns immediately and take a large delegation of country down to the Indian River to hunt and fish at favorable points, and visit the hunting grounds and rookeries of the head waters of the St. Lucie.

The regular southeast winds have set in; the thermometer stands from 70° to 80° in the shade, which gives us just the weather to eat, drink and sleep in the open air. Last year we had five or six weeks of continuous pleasant weather without a single rainy day; and now, as the weather has become settled, we shall look for it to continue this.

RICR BIRD.

ROCK LEDGE, Fla., Feb. 6.

### IOWA NOTES.

THE winter here has been of unusual severity. Sixty-five days straight of excellent sleighing, with snow from one to two and a half feet deep. Of course such weather is largely destructive of small game; we look for no more quail shooting here for years. Quail have been growing scarcer and scarcer here of late, yet in spite of this, and in spite of the prospects of this extraordinary winter, two of our so-called sportsmen, who hunt invariably for the bag all through the season, and for sport I know, long after the season, persisted in the pursuit of the poor Bob Whites, whose whereabouts they learned from their allies in the country, until they have secured, it is proved, nearly all that were left. They probably killed 500 or 600. They have no care for others, and no concern for the future. There are many like them, and while such exist it does seem almost foolish to attempt the practice of the rules of honorable sport. The parties with whom I hunted the past season, however, refused steadfastly to kill a single quail. We did that much; it was so much more for the pot-hunters; they should thank us.

So great has been the scarcity of food that game and birds of all kinds have been rendered almost helpless or unnaturally bold. The rabbits, of which we still have considerable numbers, grow so thin that it is alleged they are quite transparent when skinned. Large flocks of crows have wintered in the dog yards of the residences in our town, in many instances becoming so careless of man's presence that one could approach within twenty feet of them. Such has been their unnatural desperation that, lighting in numbers about the stock yards of the C. R. I. & P. depot, they have actually been known and seen to alight on the shoulders of a living hog and peck a hole into the living flesh. It became necessary to station men with guns to keep them off. The above statement has been met with Homeric laughter all through the West, but it is nevertheless true.

We saw our first wild geese on the 1st of March. They do not stop here very often now, though twenty years ago, they tell me, the Skunk bottoms were black with them. Most of the geese have passed north of us before the ice is broken up in our streams, and are all gone before the duck season begins. I am told that ducks were seen a week ago; two weeks later, or possibly before, we will have duck-shooting. Everything here depends on the height of the water in Skunk River during the migratory period. When there is, as often there is, a broad strip of water a mile or more wide, running diagonally across the State directly in the line of flight, we often have good sport.

The ducks are about the only game we have. Pinnated grouse almost gone in this section. Ruffed grouse very rare indeed. Even the ducks are becoming scarce and wild, under the incessant fusillade which meets them at all seasons from every boy and every cured market-shooting pot-hunter who can steal enough to buy one of those abominations, a cheap English breech-loader. Oh! if I were Congress, wouldn't those guns be taxed and barred. I am discouraged. I am disgusted. It is so useless to try to stop the war of extermination. Our game laws are dead letters. Our citizens are afraid to enforce them. The sworn officers of justice, and the very justices of the peace, are too apathetic or too cowardly to take a stand. The gun clubs are the worst pot-hunters of all. I am discouraged. I am disgusted. I am of a mind, at the age of twenty-five, to hang up my gun.

Here in our river, probably the best stream in the State for number and variety of game fish—here where enormous black bass, pike-perch and muscogee once played the stream, and would have been a good sport for any fisher. If only gentlemen present them, you may notice the effect of the undue greed of man. Traps, set-nets, gill-nets, seines—every poaching device imaginable, and all practiced right under our very noses—have all combined to deplete our fertile waters, till a few under-sized fish, last among the unfortunate, represent the luck of an average day's fishing.

We do not use very fine lines out here. One stream is muddy, lined with mud, and full of mud. Heavy fickle, with live bait, is found most effective. Spoon-hooks are often effective in the bayous during the early spring. The fly can be used only rarely to any advantage. The live minnow is our most killing bait.

This is a famous stream for big muscogee. The nets don't stop them so readily. My father caught one a few years ago that weighed twenty-five pounds. Many have been caught of nearly that weight.

If the seining were stopped here for five years, our waters would be well restocked. It is a horrid fate for a game man to die in a prison. It is a horrid death for a game fish to die in a net. May the souls of these slaughtered ones haunt and curse their destroyers!

You see even our fishing is falling off. At the last fishing trip we made last fall, Judge H. S. W., as ardent and jolly

an angler as ever spun a reel, recorded a solemn vow that he would fish no more in Skunk River. But then the Judge was very warm; and he had broken his fly-rod in a tree.

By the way, in an old number of *FOREST AND STREAM*, I see that Lieut. Thurston and wife, of our State University, were up in Michigan last season. The big trout that Mrs. Thurston caught should have considered his death a privilege. If the Lieutenant had only told me when I was under his instruction at the university, that he too was a lover of the rod, I should have studied my infantry tactics harder for him.

Let me close my rambling notes by a word of hearty approbation of your course as to the Park monopoly fraud. Be sure your readers will hold up your hands in what way they can. We hope that dreaded national disgrace will not be blotted into our record. And we know *FOREST AND STREAM* is doing much to keep it out.

E. HUGHES.

Newtown, Iowa, March 9, 1883.

### THE BIG-GUNS.

WE give herewith a sketch of the big ducking guns recently captured from the night hunters of Speciosa Island. From the description already given of the number in which these destructive weapons are employed we quote: "A gun of this kind is mounted in the bows of a small skiff, which can either be navigated in water or put upon runners, and propelled over the ice. The stock of the gun is braced against a block, so that the recoil sends the boat back through the water, and there is no big shock as there otherwise would be. The gun is usually painted the color of the boat, some dull neutral tint, and is fitted with a patent buoy, by which the owner, if surprised by an officer of the law, can pitch it overboard and return for it again when the alarm is over." The gunner lies in the bottom of the boat and propels the craft with a paddle. "The sound of one of the guns can be heard five miles, and the destruction of ducks is great, as they sleep quietly upon the water. There are instances recorded were eighty-five and one hundred

BIG-GUNS OF SPECIOSA ISLAND.

canvas-backs were killed at one discharge. On account of this slaughter the law passed by the last Legislature imposes a fine of \$200 or imprisonment for each and every offense constituted by having in possession, using or disposing of any sink boat, sneak boat, big or swivel gun, or killing a duck in the night time in any manner in the Chesapeake Bay or its tributaries." Our sketch is taken from a photograph, for which we are indebted to the courtesy of John E. Semmes, Esq., of Baltimore, through whose exertions, it will be remembered, the guns were confiscated. The sketch represents them as standing by the side of ordinary shotguns, and shows by comparison the difference between the two styles of arms. The largest of the big guns was 10 feet in length, 1½ inch bore, weighed 160 pounds, and was loaded with a charge of 1 or 2 pound of powder and 1½ pounds of shot. This one with the next in size were made by an old gunsmith of Havre de Grace, who is still living, though we understand he "has gone out of the business." The smallest gun, weighing about seventy-five pounds, was an imported one.

CONNECTICUT QUAIL.—Windsor Locks, March 10.—Good season for the quail here this winter, most all lived over.—YOUNGSTER.

ST. LAWRENCE GAME CLUB.—The third annual meeting of this club was held at Ogdensburg, N. Y., on the 7th inst. President Heard reported a steady growth of public opinion in favor of the support of the object of the society, the indictment of fourteen persons for violation of the game laws; the destruction of seines and gill nets in Oswegatchie and adjacent towns by the agents of this club, and not by officers elected by the people to enforce said laws. He was emphatic in the opinion that the State needs more game and fish protectors, and that there is urgent necessity for their services in that region of the State lying north and west of the Adirondacks; and recommended the appointment of a committee to confer with the Governor on the subject. The report of the treasurer showed receipts amounting to \$512, disbursements \$503, with no unpaid bills. The following twelve trustees were elected: M. D. Packard, J. H. Rushville, S. D. Kimball, of Canton; George H. Clark, of Fullerton; Iron Works; John Webb, Jr., George P. Ormiston, of Gouverneur; J. L. Brown, Alcu Olmstead, of Watouan; James R. Smith, of Russell; J. McNaughton, J. H. Brown, Wm. Peters of Ogdensburg. The Board of Trustees then met and elected the following officers for the ensuing year: L. D. Hoard, President; E. F. Beardslee, Vice-President; N. W. Howard, Secretary and Treasurer. Mr. McNaughton then moved that a committee be appointed by the president, the number at his discretion, to confer with the Governor as to the appointment of game and fish protectors. The motion prevailed, and the following were announced as such committee: J. McNaughton, D. Magone, William Peters, Leslie W. Russell, John Webb, Jr., D. S. Lynde. Mr. Peters moved that L. D. Hoard be added to the committee—it was so ordered.—N. W. HOWARD, Secretary.

"WE ARE FEARFULLY AND WONDERFULLY MADE."—Near Poake's Cross Roads, Virginia, March 5.—*Editor Forest and Stream:* I have come to the conclusion, after some thought, that our friends of the North are blessed with much more volubility of stomach than their brethren of the South. Some years since, a gentleman from Virginia was on a business trip to a town in one of the Northern States, and after he and the rest of the guests had finished their breakfast on the second day after his arrival, a man came into the general room of the tavern where the Virginian was and told the tavern keeper he wanted breakfast. My friend said, judging from his general appearance, he had been "making a night of it." Upon being asked what he would have for his breakfast, he ordered "a salt herring, two large cucumbers and a quart of buttermilk." My friend scraped an acquaintance with the fellow to see what his strange brood fast, and avers that "he finished off the mess with two biscuits and a half pint of molasses." "Mark West," in your bright elegant issue of the 23d of February, gives us the second bowler to this order, but takes his liquors after instead of before the feast. Hear him: "That evening, after we had reached home and had disposed of an enormous quantity of slippers (I believe they are fated in grass), stewed (?) grouse, milk and pumpkin pie, Sam set a big pitcher of cold cider upon the table." Mr. Glover, same issue, informs us that in his part of the country they "con-sign" undesirable whelps "to the water bucket."—R. M. C.

NOTES FROM WORCESTER, MASS.—March 10.—The annual meeting of the Worcester Sportsmen's Club was held Wednesday evening, March 7, at the Bay State House. The officers elected for the ensuing year are: Maj. J. L. O. White, President; Wm. S. Perry, First Vice-President; John B. Goodell, Second Vice-President; Chas. Hartwell, Secretary; O. L. Taft, Treasurer; G. J. Rugg, A. B. F. Kinney, C. A. Allen, O. A. Benoit, Executive Committee. The club was organized nine years ago, and was never in a more flourishing condition than at present, the treasurer's report showing a larger surplus than for several years. It was voted at the annual meeting to hold a "fishing day" sometime during the trout season, which will be conducted on the same general plan as the annual hunt, the fish dinner to be served on the evening of the following day. C. A. Allen and O. A. Benoit were chosen captains, who, with Secretary Hartwell, constitute the committee to arrange a scale of points and perfect all the arrangements for the affair. It was thought best not to fix the date till later in the season. The fishing is entirely new to the club, and was started by a member who is an enthusiastic trout fisherman; but anything that is to wind up with one of Landford Shepard's elegant dinners at the Bay State House is apt to take wonderfully well, and the members look forward to this affair with much pleasure.—K.

SUMMER SHOOTING.—Would not the law respecting deer be about as satisfactory as possible if it permitted the shooting of bucks in July, August and September, but forbade the killing of does before October? I know summer venison is poor stuff; still there is such a desire for it that perhaps the law would do wisely to allow it to be killed if that can be done without inhumanity or undue hardship.

The only objection to killing the males in July (as compared with September) is their poor condition. I suppose the supply would not be materially reduced, although the bucks should be much less numerous than the does. An apparent objection to this suggestion is the difficulty of enforcing the proposed law. But is it not generally nearly as easy to prove that a doe was killed as that a deer was killed, at a certain time and place? On the other hand, the temptation to break the law would be much diminished.—PICKET.

NEWS FROM WOLF POINT, MONTANA TERRITORY.—Feb. 25.—*Editor Forest and Stream:* We have had a very severe winter, but game of all kinds has done well. Buffalo, deer and antelope up to this date are in good condition. The Indians and white hunters have had quite a dispute over hunting on the reservation; but with the aid of the military and the Indian agent, N. S. Porter, the whites had to vacate the ranch. Ducks and geese will be along to visit us again in about twenty days. Have done very little hunting this winter, cause, as you expect, to hit it a lick in the spring.—TICPAPA. [We hope to hear from our correspondent when he hits the lick.]

CONVERTING THE GUNSMITHS.—Philadelphia, March 12.—*Editor Forest and Stream:* As a dealer and gunmaker I could at first hardly support Mr. Heath's astonishing statement; but there need be no doubt entertained by any reader who has heard of my premises, and I myself saw him fire his tests (he used in fact a large number of them) more than a hundred shots from the loads, the loads of which were "air-speed." Neither rifles nor shooters were injured.—C. A. M.

**GUINEA FOWL AS GAME BIRDS.**—I will give you my personal experience. In the year 1856, living in Dearborn county, Southern Indiana, on a farm that was not being cultivated, I bought a large number of common domestic fowl, also about a dozen guinea fowls. At first the guinea fowls stayed around the barns with the others. In a short time they missed them. Occasionally during the summer we would hear them in the neighboring fields, which were grown up with high weeds. In the month of September, while out with my dog and gun after quail, I noticed the setter act in a strange manner. He would come to a point and then start on again. Finally the dog flushed a guinea fowl; soon afterward two more. I came to the conclusion that they were my own birds, as there was no other house within half a mile. Soon my dog came to a very staunch point; I walked in and put up a guinea, and shot and killed it. In one hour's time I shot four more. This being all I wished, I returned to the house. During the fall months at different times I shot forty-one guineas, and had capital sport. When the weather got cold, in December, the rest of the guineas came up to the house (I should judge at least thirty birds) and roosted in the barns and sheds with the other fowls. As a game bird, they make capital sport, being somewhat quicker in flight than the prairie chicken, to which their habits are very similar, only that when the weeds are dry they would run a long distance before taking flight. Their flesh is quite dark, and when young they are very fine eating. I prefer them to the prairie chicken.—**BRAID.**

**MAINE LAWS ENFORCED.**—MOBSON, March 5, 1893.—*Editor Forest and Stream:* Warden Morse of Eddington, Me., has been making some official visits to this region, which have proved very effectual. Some members of the Piscataquis Game and Fish Protective Society informed him of the transportation of a quantity of deer en route for Boston, and Tuesday, February 27, he pursued them and seized thirteen venison saddles at the express office in Dexter. The Grand Jury being in session at Dover, he had the parties indicted, but up to this time they have not been found by the officers. They absconded as soon as they received information that their plunder had been taken. The game laws are being unusually well enforced here now. We have a sound public sentiment among nearly all of our citizens in favor of prosecutions, which is a great aid to the officers in their work. The bill before the Legislature to raise the annual appropriation to the Fish and Game Commissions from \$5,000 to \$7,500 will undoubtedly become a law.—**J. F. S.**

**MASSACHUSETTS.**—TAUNTON, Mass., March 10.—*Editor Forest and Stream:* I clip the following from the recent issue of a Cape Cod paper, the *Harwich Independent*: "Mr. C. A. Caboon is getting signatures to the following petition: 'To the Honorable Senate and House of Representatives assembled: We, the undersigned, do hereby ask your honorable body for a special act prohibiting the shooting or taking in any way any wild duck, commonly called black duck, by the use of decoys, whether wood decoys, live duck decoys, or any other kind, at any season of any year, except the months of October and November of each year, for the term of five years (such act to go into effect on its passage) in any of the ponds commonly called and known by the name of Child Ponds, viz., Big Cliff, Little Cliff and Lower Cliff, situated in the towns of Brewster and Orleans, Barnstable county, State of Massachusetts.'"—**CHESTER.**

**LONG ISLAND ASSOCIATION.**—The annual meeting of the Long Island Sportsman's Association was held at the headquarters of the organization, Gun Club, No. 431 Flatbush avenue, Brooklyn, Monday evening. The following officers were elected for the ensuing year: President—Henry Allen Brandt, Washington Club; Vice-Presidents—Charles W. Wingert, Fountain Club; Hugh McLaughlin, Coney Island Club; Robert Rinson, Long Island Club; Charles W. Rodman, Garden City Club; Samuel S. Conant, Nonpareil Club. Secretary—Henry Thorpe, Long Island Forester Club; Treasurer—N. D. Cooke, Fountain Club. Legislative Committee—Abel Crook, F. C. Chamberlain and F. S. Massey.

**THE ENDLESS DISPUTATION.**—LEESBURG, Va.—The shooting season having come to an end the gunners spend their time quarreling over the merits of their respective guns, each having advocates who claim to have several "the best gun in America." Then they quarrel over hammerless and with hammers made by same maker. All the disputants are disinterested, of course, though strange to say, each happens to admire his own.—**T. W.**

**STONEHAM, Mass., March 7, 1893.**—At the annual meeting of the Stoneham Sportsman's Club, the following officers were elected: President, P. H. Horne; First Vice-President, Elbridge Gerry; Second Vice-President, J. D. Pierce; Secretary, B. R. Houghton; Treasurer, F. M. Switzer; Trustees, B. W. Jones, John Norton, William Whowell.

**NEW JERSEY.**—LAYTON, Sussex County, March 8.—Quail have wintered good, and thus far have found plenty of good feeding ground; the prospects are that they will be more numerous this coming fall than for many years. Partridges are scarce.—**D. R. L.**

**NEW JERSEY.**—TOMS RIVER, N. J., March 11.—Quail have wintered well in this section. I do not believe that a single bird has perished from cold or want of food. Am looking out for snipe to be along very soon.—**H. CLAY GLOVER.**

Statistics of a quail hunt in Georgia, gathered by the *Atlanta Constitution*: The Marietta & North Georgia road is the great route for quail hunters. The other day there were 22,000 worth of dogs (cash valuation) in the baggage car on that road, attended by 26,000 worth of negroes (old valuation). The coaches were \$1,400 worth and \$20 worth of birds. On the return trip they had \$5.50 worth of birds, and they ate a \$20 lunch.

## Camp Fire Flickerings.

"That reminds me."

**READING** "Reidnolds's" account of a remarkable coincidence happening to him on Long Island, recalls to my mind as singular a coincidence: but I can hardly call it similar, as neither the place nor birds were the same. It was in the latter part of November, and we lay on a point in the Great South Bay, directly opposite Babylon. The sun was slowly looming up in the east, the wind blowing from the same quarter in a way that would have gladdened the heart of Wiggins, could he have foretold its coming; and as for the cold, well that can only be appreciated by those of you who have spent a winter's day in a cramped-up sharpie on the unprotected "marsh" of the great South. My bayard and myself were lying in the bottom of the boat shivering, and not the sign of a bird, excepting a great bunch of broadbills, that seemed to drift lazily along with the wind, at a distance of a mile or so from shore, but never venturing nearer.

You can well believe that I was not feeling extremely lively; so to make things agreeable as well as to kill time, my bayman (thanks to him for the attention shown me during that pleasant week spent on his trim little oyster sloop), led off with a string of marvellous shooting exploits, all of which had been performed by either himself or his father. I listened to a number without comment, until he came to one which struck me as being a "Davy Crockett," sure. The story went as follows:

He was gunning at the mouth of a small creek with a miscellaneous lot of "stoops" set out and upward, of forty birds heaped upon the stern. Suddenly he discerned a bird of enormous size making directly at him or his birds, he was in doubt which to shoot. To protect himself, he immediately fired both barrels simultaneously, but although he wounded it, failed to stop the bird's onward course. "I saw now," said he, "that it was an eagle, and a big one, too, so I did not lose any time getting overboard, although it was near the middle of winter. He struck square in their boat and in a minute was out in their water after me, but I took an oar with me when I went over, and although I killed him with it he tried to drown me to get his claws in me."

This yarn I received with an ill-concealed sneer, and suggested that probably he had indulged too freely in "tangle foot" that morning, and had fallen overboard, and I was ridiculing the idea of the bird falling into the boat, etc.; but I was cut short in my remarks by the sudden appearance of a dark object directly in the sun's rays which seemed to be coming straight at us. I took a snap shot at it and paused for results, which came in a very unexpected manner—*scrip, bang!* and here I received with duck our leader's "fat old sheldrake landed directly in the boat between us. "There now," triumphantly shouted my bayman, swinging the bird aloft, "you won't believe my eagle story?" "Yes," said I laughing, "I believe it now, after having it so well illustrated. We had a narrow escape indeed." **B. L.**

BROOKLYN, L. I.

## Sea and River Fishing.

To insure prompt attention, communications should be addressed to the *Forest and Stream*, Publishing Co., and not to individuals, in whose absence from the office matters of importance are liable to delay.

I enjoy a good joke or argument, but I don't think much of a man who uses such words as "bloomin'!" "so help me," "tosh!" "alorn wuss." Darns in stockings is signs of 'olish,' and unobjectionable poverty, but in conversational they show a poverty of language.—*The Kaukaigh Arlmink.*

### WITH HACKLES AND GENTLES.

VIII.

"Bright blaze'd the fire of crackling wood,  
And thence around a charming gleam;  
In front a vast oak table stood—  
A bacon rack hung from the beam;  
Pipes, mugs, the chimney-piece well graced—  
In rows the fishing-rods hung o'er;  
On each side other skins were placed—  
A rap!—cries danger, 'Who's at the door?'"

CHORUS.

"Some jolly anglers," loud they call,  
"T' enjoy the pastime at Trout-Hall!"

**WHAT** a pretty picture of an English angler's inn doth the above verse give, and especially to those "to the manner born"! The old song goes on to portray the good cheer of the dame's house, and often reminds one of the simple and pleasant conceits of the "Complex Angler," and of the "innocent trout" indulged in by the great master of the "gentle art" and his beloved pupils and chance-net fellow craftsman.

How effective are the "otter skins," hanging by the quaint old chimney-piece in that they suggest to the angler that, at least, just so many deadly enemies of the trout are well rid of. A brace or two of otter hounds should have been added to the scene to make it perfect! Left to the imagination, however, we can permit us to suit ourselves, and before that gorgeous blaze, or under that sturdy table, they ought to be. The old and cunning four-legged race of otters has given place to a new and less noble genus, wholly devoid of the better and fully endowed with the baser qualities of the extinct species.

This new pest of our trout streams goes about on two legs, and has not the discriminating taste for noble fish that the old-time catfish has, *et cetera*, and all fish he can lure within reach of his greedy clutch. It is a shame—a pitiful shame—that such human others exist, and it were well if a breed of hounds were "to the fore" capable of "drawing" them and giving to each and every one the fate of "vermin." Their skins, however, should never be displayed in any "Trout Hall," but, rather, at cross-roads and by streamside, as a warning to any existing whelp of the family of the probability in store for him.

It is the bounden duty of every sportsman, angler, shooter, or huntsman, to constitute himself, as far as may be, a game keeper on his own "preserve." In other words, to guard his own interests and those of his craft against the encroachment of any poaching pursuit of game in close season, the needless destruction of game at any time, and to see that the

laws are wise ones and rigidly enforced. There are many towns (alas! too many, in this beautiful age and country!) which have no more respect for the game laws than for the noble trees that are, one by one, felled to the ground. It were well if some movement might be made to post, in many conspicuous places, copies of the laws relating to close seasons, and the penalties for infringement of the same. The publisher of every local paper ought to be willing to publish such, if concise and digested, and in every village, post-office and shop there should be a copy, also. Ignorance (even in these enlightened (?) days) is an excuse for many a wrong doing, where, if it may be, the unwitting transgressor would be a model of propriety, if he but knew what the law declared right or wrong. The above point suggests itself: Early in April of last year, I was driven on a country road, and enjoying the first advance of spring and the songs of robins and bluebirds, when in a neighboring field I saw a man (the proved to be stuck after all) with a shotgun in his hands and two little boys at his heels. I kept "my eye on him," and he so doing plainly saw him level his gun at a robin and fire, evidently without effect. He then deliberately declared his intent, but before the charge was driven home, I challenged him to halt, and having the buggy, I scaled the fence, and a brisk walk brought me within talking distance and to confront him. Telling, by a glance, how best to address him, I asked him if he was aware that a law existed forbidding the shooting of song birds at any time and especially in the spring? He replied that he was not aware of any such law; that he came out to shoot a bird or two, to please his boys, who were teasing him every day to "go a-hunting"—as he expressed it.

He said he had not shot any nor injured any and promised me not to do so. I told him the penalty was ten dollars for every bird killed and that he should set the "boys" a better example. That I felt it my duty to tell him and that "a word to the wise," etc. I left him and drove on my way. A few weeks since I had occasion to take the cars at the little station nearest to the above mentioned road and field, and to my surprise the "hunting" party familiarly recognized and addressed me. He said that he found I was right and very courteously thanked me for "stopping his little game." In the few minutes before the coming of the train we had a little rational talk about game laws and humanity, and I was pleased to find that, barring this one graceless, thoughtless act, he had a fleshly and considerate heart hidden away under his coat. This man might have shot robins and bluebirds all day long had I not chanced to arrive, for he was in the habit of shooting them, and as known and respected quite as well as the forgotten one of the "Medes and Persians," but I have reason to think he was honest and that he will make others so likewise.

This is a long digression from my subject and intent—so long a detour is it that I shall not try to find my way back, but will "run riot" to the end of this rambling chapter.

This passing sweet once in a while to wander up and down a brook, with now a "pusher" back, and now a "May fly" on the leader, and to bring to dred only a few game of well-conditioned fish. To go from deep to deep, from one likely "hole" to another, pausing often to note the changes of the passing months on the banks of the stream, and to be quite as well pleased to know there are still trout in the favorite stream as to take them thence. Trout are not always "on the feed," and why should the angler be always on the greed to kill them?

There are waters in which I would not cast a lure for a "sizable" trout, even if I knew I could bring him to net. Why? They are sacred to the past! To the past jolly anglers, "who have fished with me there; to the past goodly trout that erst bent my rod there!"

"Vale of bliss; what joy to wander  
Where thy glittering waters flow;  
Here ere 'Guilt in peace may ponder,  
Here Despair forget his woe!"

'Tis sentimental? Nay, not so, good friend. Think for a moment what spot would be if robbed of sentiment—mere cold-blooded butchery! Who would go to an abattoir for sport? I will add, also, who would go to a battue, in the wildwood, when the half-tame birds almost touch the muzzle in their startled flight? The average life is too void of sentiment, as many a goodly dish is too void of seasoning, giving no zest to the palate nor vigor to the stomach.

The will and forethought only is needed to make his life less full of care; to place a rose here and a lily there in the pathway, to unbar the senses to all the genial influences that revel in wood and water, in the sky above and earth beneath, and let them in to join with sentiment in making life less a treadmill and more of a goodly pleasureance. At any rate, and however with others it may be, our beloved master, "honest Izaak Walton," set the craft a noble example of cheerfulness and sentiment, and we can but follow hard after. Few anglers can have a "Trout Hall" in every "outing" or at every corner; but, when arrived at the welcome portal, let him stay without doors who cannot sing with honest zeal:

"Begone, dull care! shouts every soul;  
To thee this is forbidden ground;  
Begone! Thou never can'st enthrall  
The jolly anglers of Trout Hall!"

O. W. R.

### SOMETHING ABOUT THE PIKE-PERCH.

*Editor Forest and Stream:*

Ever since your call for something concerning the wall-eyed pike, or pike-perch, I have been expecting to see a screed in praise of his beauty and goodness and game qualities. But so far nothing has appeared but the short and disparaging communication of "Wall E. Pike," which only goes to prove what I long ago said in your columns, that the habits of game and fish so differ in varied localities that it behooves those whose observations have been limited to their own neighborhoods to be careful of making sweeping assertions in matters of natural history. In instance, I observed, one of our foremost and most delightful writers on outdoor life held for twenty years that bees never gathered honey from the arbutus, but at last he caught them in the act, as eager for the sweet heart of the scented blossoms as any wood-haunting doer hunter for the blossoms themselves. If anyone else had reported such doings he would not have believed the tale, but his own eyes were witnesses whose testimony he could not deny.

If you were to ask those who "go a-fishing" in Lake Champlain what fish of its waters afford most sport, I am sure that nine-tenths of those who fish for sport would name, first the black bass, and next the pike-perch, and would tell you that the last is generally a bold biter and fights well, if not

to the last gasp, for life and freedom. Yet I do not know that he is ever scientifically fished for here, either with the traditional fly, which I have never known to be offered him, though Dr. Esler says he will take ("the Collick Gazette" or, with the minnow, which is the usual bait in these waters. At Thompson's Point and Spit Rock, which are the most celebrated places for taking this fish with the hook, and when the fishing is done entirely from anchored boats, as far as I know only heavy, stiff rods, with coarse lines are used. When the fish is struck the rod is laid aside and the line is pulled in hand over hand as quickly as possible, and the fish is then taken in the fight it is wont to believe the only aim is to make the biggest score among those who congregate there to "camp out," as they term it, in perfectly comfortable and well-furnished houses.

Of course such fishing is not sport; it is only fun, even when the fish are biting freely, and when they are not it is as stupid a pastime as sitting all day on a runway to which no one but mousie de hounds come.

But light rods and tackle would make a different affair of it, giving the fish some chance of his life and the angler some opportunity to exercise his skill. With such gear I remember having a tussle with a pike-perch, in "Sungahmetuk" while fishing for bass, which afforded me great sport for ten minutes or more, and I doubt not as much to the fish, barring the slight pain in his jaw, till he lay "gassing out."

In the latter part of May and in June the pike-perch is trolled for with a spoon in the streams emptying into the lake, and affords more sport than any other fish so taken here except the bass. At this time it is not uncommon to take them with worms on a drop line.

Our pike-perch seldom attain a greater weight than six pounds, and this is exceptional, the fish in general running from one to three pounds. Perhaps the Western fish are too overgrown and lazy to give much sport, or perhaps they are so old that they are tired of life, and do not think it worth fighting for. I do not pretend to know much about this fish, and have only set down this little concerning him in the hope that it may draw something better worth reading from those who know more of him. A. W. A. MOUSIE.

March 11, 1888.

[We repeat our call for further notes on this subject.]

#### ANGLING AT LAKE COPAKE.

THE weather has much to do with one's fever for fishing. After a summer shower, not serious enough to make the streams roily, but the least bit milky perhaps, the angler tells what he feels, and says, "Now the fish will bite," and under the spell of this conviction he is off with his rod for a bout. How glad the country boys are when the rain begins to fall, for the double reason that it affords them a respite from hard harvest work, and an opportunity to go a-fishing.

It sometime happens that the fever seizes the old farmers of a neighborhood, and that which has had long rest during the busy summer, is unrolled, spread out upon the lawn, inspected, and if needs be, hastily repaired, while others put the team to the wagon to carry them to the river. They all get their inspiration from the weather.

When our little party of three started last September from the Central Depot, via the New York & Harlem Railroad, for Copake Lake, the gentle rainfall of the day before had so refreshed the varied landscapes by its grateful baptism that our spirits were wrought up to a fever pitch. We felt that we were journeying on to sure success, and could hardly repress signs of impatience at the slow progress of the train, though it was running up to schedule time, in such haste were we to be upon the lake, fishing. At last, as the train slowed up, "Copake," shouted the brakeman. With a feeling of sweet relief, at reaching our journey's end, we seized our grippes and fishing tackle and hurried down the stairs, and with a modest dwelling on the lake shore, and who earns his rent and something more, boarding tramps like ourselves, letting boats and furnishing bait, had been apprised of our coming, and was waiting at the depot with a spanking team and commodious wagon to carry us to the lake three miles away. The ride over, amid beautiful scenery, was delightful, and grateful to our nostrils was the fragrance of the meadows, and the sweet melody of robins forcing their way through the "smoke." Mrs. Loup received us cordially, and with the gratifying announcement that dinner would be ready soon. Meantime we joined our rods, fixed our reels and lines, and provided a good supply of bait. Dinner once ready, it was soon dispatched, with right hearty relish, and we were upon the lake, enjoying the supreme moment, about which we had talked many days, for which we rode out from the city, and which cost half a dozen dollars.

It was soon apparent that we had come at an evil time, for as bad luck would have it, the lake was in "blow" or "blossom," as it is sometimes called, so that the bass would not take the fly, for the simple reason that they could not see it, and they could scarcely be enticed by the most luring lure. I never saw lake water so forbidding a condition for fishing. At some of the best fishing grounds the surface was covered with a dirty, greenish scum, such as is often seen on a stagnant pool chiefly inhabited by bullfrogs and snapping turtles.

Though, when we returned at noon or night to headquarters, we always had some fresh-caught bass for Loup's large floating creel, which he kept anchored near the shore in front of his house, yet during our stay of nearly a week we added nothing to the stock of fish in Loup's creel, which we entertain our friends upon our return home, barring the following about "mine host," Loup and his neighbor, Conklin. It appears that Conklin was a rival of Loup's; therefore, at the opening of the season, to draw custom to his house and boats, he purchased a handsome split bamboo rod, which he offered as a prize to whomever might take the largest bass, each competitor for the rod, however, was to pay Conklin five cents, the prize was to be paid to the winner, the best caught, and when caught it had to be weighed on Conklin's scales, in Conklin's presence, and the weight by him recorded. Loup paid the required amount and went to fishing with a will for the winning bass. Finally he caught a noble fellow, which he thought would win the prize, but to make sure of it he administered to the fish a regular allopathic dose of shot. Loup then called on his rival neighbor on the opposite shore, who was waiting for him, and weighed and entered, it being the heaviest by over a pound yet taken.

No sooner was Loup out of sight of Conklin than he proceeded to disgorge the fish of the shot, making clean work of it, as he supposed. Fortunately for the next highest competitor, but unfortunately for Loup, he gave the fish to a farmer friend of his, whom he found waiting to see him at his house, whose wife, in the process of cleaning it, discovered the fish, discovered a remaining shot that Loup

had failed to disgorge. She, of course, as any loyal wife would, disclosed the fact to her husband, and he again to his neighbor, and that neighbor to his, until it reached Conklin, who at once raised the record and thus Loup forfeited his claim. What added cream to the joke and chagrin to Loup, was the fact that his fish, without the half pound of shot, which in that doubtful and evil moment he had charged him with, would have finally taken the prize at the end of the season. Loup is a character. We called him "Old Loup," not that he was old in years, but old in tricks. For once, however, he held the winning card and played it, but he lost the trick, and he will never hear the last of it so long as he lives on Lake Copake.

On another shore of this lake there lives a very numerous family. Every day we would see the young urchins playing on the pebbly beach. One would actually suppose that the district school was kept there. But Old Loup insisted that one mother mothered them all. "Why," said he, "she has got so many children that one day three of them ran away, and they were not missed until the next Sunday," when the mother laid out the Sunday suits for the family.

The stories that Loup told in his dry, off-hand way, when the fish were not biting, helped wonderfully to beguile the time that we spent at Copake. Loup differs from his rival, Conklin, in that he is a joker, and a joker is good company in poor fishing, better than in good fishing, when his joking jargon is too distracting.

Hix.

#### BITS OF FLORIDA EXPERIENCE.—IV.

I HAVE followed Dr. Henshall in his coast trip with much interest and pleasure. Part of the way I have been myself, viz., considerable of the Indian River trip, and enjoyed very much memories, as I read, of well-known points, particularly St. Sebastian River, up which our party went several very crooked miles fishing and shooting cators and deer. And well do I remember the night I spent there, with our boat tied under a ten-foot bluff. The air was full of musquitoes. In fact there was very little air and more musquitoes, more all the time. We built huge smudges on the bluff, and they were a failure. We rolled ourselves in blankets until from lack of breath we were compelled to let the beasts at us again. We smoked and talked, and sleeping vigorously the meanwhile. We betook ourselves to the boat and tried to protect ourselves with netting, but there were too many cracks, and so the night wore away and nearly wore us out. It is seldom that a sportsman does not pay dearly for all his sport.

We caught a number of sea bass and trout, and sharks from the bar, making out from the south side at the mouth, and just where the bay is so doing. Sea bass are abundant for a while, but it becomes labor ere long. As for the black bass, they do not compare with the Northern bass for gameness, and one who has played a three-pound fish in Northern waters, particularly of the small-mouthed variety, will soon tire of Southern black-bass fishing. The big mouth tire soon and is willing to be led in. I have taken many with the fly when the sport is very good, but in many of the most favorable spots a still rod and absolutely necessary to keep the fish out of the grass and bonnets. The most successful mode was to float down stream fifteen or twenty feet from shore and cast in with a three-inch phantom minnow. I rarely failed to obtain all I wished in this way. The negroes use a piece of bacon rind two or three inches long by a half-inch wide, fixed so it will trail from the hook, and are generally very successful. These negroes do their first bass fishing in Florida as enthusiastically as men can well be. Fish are waiting almost anywhere to be taken. There are "bass hogs," too, as well as "trout hogs." Two or three years since I saw a man on the St. Johns from Brooklyn, N. Y., who was on the river above Lake Monroe, every day when he could get out, and his usual catch was from fifteen to forty. What could he do with them? The St. Johns has a large river and country innumerable fish, but many years will not elapse before bass fishing there will be hard work with very poor sport.

I have had good small sport catching bream with the fly toward night, using the white miller. A black bass, although a *Micropterus*, is not a bass at the South, but a trout. But is what is called a bream there really a bream, or is it a perch? These fish, although gamey and large size, consume too much vegetable food to be really toothsome from the fly. I should think, would detract much from the good qualities of the carp. I think I have enjoyed fully as much sport with the blue catfish as with any other fish in Florida. A ten-pound cat, with a moderately heavy rod, will give a person employment enough for a few minutes.

I notice Dr. Henshall mentions the man-o'-war hawk and frigate bird as being nuisances for health, none can be had. But I am sure, and believe it to be entirely different in habitat as well as form from the frigate bird of the ornithologists. Does not the latter make his home in the Southern hemisphere?

I am writing on Wiggins's day, or one of them, and we are having the heaviest snowstorm of the season. How different from scenes in Florida to-day. The boys are playing gardening and State and County fairs, nowadays. The claims by newspapers and real estate men that vegetables can be raised all the year there. So they can in tin cans, with a good many dollars. They do it this way sometime: Send to Mapes or Forrester, or Baker or Bowker, or some one else for a ton or tons of chemical fertilizers at \$34.50 per ton and raise vegetables or fruit to the amount of \$150.00 per ton. It is claimed that the State is growing wealthy.

In the hot weather there, when fresh fruits and vegetables are absolutely necessary for health, none can be had. But they can raise oranges and don't have snow-storms, both with limitations. It would tickle a Northern farmer all over to see a display of agricultural products at a State fair there. I have heard most ludicrous descriptions. But the people there fuss over it and cuddle it, and go into more ecstasies over it than a mother over her first baby, and really think they are making a wonderful thing of it—and they are.

Here's my hand to "Nessmuk." A gun isn't all of life. It's a pretty thing—to worry to spend money and time and enthusiasm on—to worry over, to keep in order; useful at times; costing too much generally; but "Nessmuk" and others of us are getting along in life, when the glamour of the gun begins to wane. We give a thought to God's creatures occasionally, and wonder if they are not entitled to life as well as we, except when we are pushed by hunger.

MARCH 10, 1888.

[The man-o'-war hawk and the frigate bird are different names for the same species (*Zeugopterus aquilus*). It is not confined to North America.]

#### STREAMS OF NORTHERN MICHIGAN.

FEAR be it from me to rail against an angler, or even at the peculiarities of one who loves the plant rod, but the letter of "Prairie Dog" is amusing to one who from year to year has fished the Michigan trout streams.

Wherever does "Prairie Dog" expect to find trout? Surely not on a mud-flat under a burning sun. Not under a dense growth of waving rushes, where his boat can lock and dip under the influence of the light ripples on the water, where he can sit and lazily take his ease on the festive perch and sometime a long-noise comes to worry his bait, and raise the hopes of our friend to the highest pitch as he queries what the luck is going to be, where he can spin his minnow attached to a treble flight of hooks and be sure of killing every time he catches on. The "Prairie Dog" considers this fishing for him enjoy it, want none of it.

I would like to see "Prairie Dog" on such a stream as was my fortune to strike during last summer, a feeder of the very Boardman River he writes of. A portion of the creek ran through a swamp in which we had to jump from log to log to secure a firm footing, but in that little creek we caught trout—pounders; as pretty as a picture, my boy said; and the streamers were there by tens of thousands. Please! didn't they lay on, and take their fill. When trout are biting who cares for "skeeters"?

I can imagine a tenderfoot in such a place. I have seen a young man go almost crazy until he used "dope" to keep them off him; then he laughed them to scorn. "Bite, you little cusses, I am going to have trout anyhow, if you do have some of my blood for it."

Loved him? I saw disappointed fishermen rail at them, and condemn their beautiful streams and lakes because they yielded no fish food by the hundreds of pounds to satisfy their ambition, but we who know them, who for years have visited its streams to tempt the trout and black bass, who enjoy a life in the woods, because it gives the weary angler the respite he needs, and takes him from the busy city life, and knows the home of his fishing place. Please! doesn't the home of the grayling under the dense forest growth, or to fling a fly for the lusty bass—we love there because they days are quiet and free from care, and they summer nights peaceful. The "skeeters" are not always as vicious as depicted.

"Prairie Dog," I can count anglers by the score who will endorse these sentiments, both men and women.

I fear it is a clear case. I saw my pleasure in the trout who fishes in the chain of lakes you passed through who would shame them, man as thou art, when bass are biting. She cares not for the dampness so dutifully depicted, but slipping on a rubber cloak she skillfully handles her rod and lands big bass, often scoring finer fish than her husband. If, perchance, she gets a little damp, laughingly says, "Oh, I'm not made of sugar, I'm too solid to melt."

I fear it is a clear case. Ephraim wedded to his idols: the mud flats of St. Clair River and the perch of the Detroit River are greater treasures than the clear springs and beautiful lakes of further north.

He can rest satisfied that if he seeks to avoid "skeeters" he will never kill trout, for it is an axiom older than either of us. When the "skeeters" are biting then trout will rise to the top of the lake.

Michigan to-day can hold its own to satisfy the demands of the angler who is content to remain an angler and not develop into the trout hog dear old "Nessmuk" has so graphically described. May the old gentleman live to see the dams of his loved fishing and canoeing grounds blown sky high by an outraged and indignant class of men whose homes are turned into a desolation and themselves slowly poisoned by a dank miasma that a corrupt and powerful monopoly have generated by flooding this once fair region.

W. D. T.

CHICAGO.

#### A CHINAMAN TAKES A TROUT.

SAM LUNG brought my shirts home one day lately, and after obtaining his trade dollar lingered as though something oppressed his mind.

"What is it, Sam? Dollar no good?" asked I.

"Yeh, dollar all litte, but want to talkee bout woodsee."

"Woodsee? what's that, Sam? Didn't I give you the right change?"

"Change alle litte too, alle same, but want to talkee bout Adirondacks. You been in Adirondacks, so Melican man tallee me."

"Yes, I have been in the Adirondacks, but what do you know about that place?"

"Know heap. I been Adirondacks too, catcatch trout on stling, no litke in net. Litke thlow fly, bloute bite, hookee in jaw, pull him topside. Wloopee! I go washee by Blue Mountain Lake, big hotel, lookee for heap washee when Melican ladce come in with whitee dress and nobby Melican man come, plenty washee, plenty money."

"Well, Sam, did you get rich there? Plenty washee and plenty dollar?"

"No washee, no dollar. Melican ladce blue dress, Melican man blue shirt, wear 'em two, three weekee, no wash. Paye on hillroad, walkee back. Catcatche tlout alle samee fore go."

"How did you get the trout, Sam? Tell me all about it."

"Old looster stoppe in hotel. He say 'Sam come in boat for guide on lake, me give half dollar day.' So I get in boat with looster and go topside lake to see him, scoope tlout."

He get out little bamboo stick and put on stling and little fly. He thlow fly but tloute no catce. Put on more fly, putty fly on stling when he see tlout come topside, and show tail way off. He thlow out and stick out hand, no catcatche. Leach out again, and plunk he got out boat and get all wette. Me no leavee him, but pull him topside in boat. He flaid to go back to hotel cause boys laff, so he tell me to make fire. Then I gottee old looster where hair is short. I make fire and he pull out big bottle whiskey and get dry. I say I go scoope tlout so boys don't laff when we come backside hotel when no catcatche. So I go out and thlow fly. Think got big bulgee on old slucker to get all fun and half dollar, an' he sit by fire so sick."

"So I thlow fly, alle same Melican man and say me no clye baht, but catcatche tlout on stling, and say bettee you livee; so I thlow and thlow and catcatche big fish and thinnke I shooke old looster, and go to hotel and showe tlout to Melican ladce and braggee alle same Melican man. So I takee baht and leave old looster on shore. He yellee likee lion, I no hear, just hove my own row, go on to hotel, takee fish on stling, and showe finee ladce big tlout. She laugh and say 'nicee flout,' and call 'Melican man. He I catcatche say 'downe be blowed, you maffee butt in daid.' So I cuttee stick fore old looster come longside hotel and kickee me topside stomach, and I hoof it down road twenty-five miles to hillroad and stealce lide to

Salatoga. Heap washee in Salatoga, water all taste like old tin, all but that."

"Well, Sam! was that all the trout you took, one horned dace?"

"Yes, trout, hav'n dace, all same, some call it floutie, some call it hawu dace. Call it trout when Melican man scoope himself, call hawn dace when other feller or Chinaman scoope. All same, I catche trout like Melican man in Aconitine. When you got topside Adlondacks again, you take me for a guide. I shovve you how scoope trout with fly on sling. Bye bye."

With a smile that was childlike and bland, Sam Lung pungled off in the direction of the flowery, scarcely soiling the white soles of his shoes in the mud of Broadway as he crossed it. I think I'll take him into the woods next season.

THE THIRSTY PELICAN.

### "SKIP THE HARD WORDS."

IF there be any among the readers of FOREST AND STREAM disposed to doubt the truth of that alliterative axiom embodied in the copy-book sentence of their boyhood, "Many men of many minds," they will find ample ground for the re-establishment of their faith in perusing the communications of some of your correspondents concerning weight of rods, position of reels, and other moot points in connection with the angling art. Their discussions certainly form most interesting and instructive reading, especially to those who, like the present writer, are tyros in the craft, or, at least, are not above seeking an addition to their stock of wisdom from that supply which, according to the Good Book, is possessed by "the multitude of counselors." Indeed, I presume that I am, as the genial "Nessmuk" observes, "well right" in supposing the arguments contained in those communications to be intended for the benefit and edification of all and sundry who may be interested in the subjects discussed, and not for the sole behoof of the disputants themselves; otherwise they would send them to each other through the usual channels of private correspondence, instead of displaying them in your columns.

Acting on this presumption, I am emboldened to offer (together with thanks for the share of their knowledge which I have thus received) the suggestion that in the discussion of matters of this kind, the "gentle" and, a little more correctly, might not be out of place, and that objection, insinuation and vituperation add nothing to the strength of an argument. Sitting humbly at the feet of these piscatory Gamaliels, I, for one, am willing and glad to hear all they may have to say about fish and fishing—the habits of the fish and the methods of the last—but it does seem to me rather hard to be compelled to listen also to the disagreeable things they may choose to say about each other; for, while it interests me to know what so expert a fisherman as X. thinks about the proper position of the reel, and what are the opinions of so high an authority as Y. on the subject of wriggle of rods, I do not in the least care to be informed that each of those gentlemen considers the other an ass, or that Z., who differs from both, holds them to be a pair of knaves; and I, meekly, but urgently, appeal to argumentative members of the craft to "study to be quiet," and to leave barking and biting, growling and fighting to Congressmen and truck-drivers, and not to degrade their vocation by making fish and calling names, especially after all that has been said and sung concerning the mild and refining influence of the pastime of angling.

What would our patron Saint Izaak say to such acrimonious dispute among his followers, think you? And would you care to encounter such an episode as this among the pages of "The Compleat Angler?"

VIATOR.—Methods, Master Piscator, that your which is misplaced on your rod, being behind your hand.

PISCATOR.—Humph!

VI.—And I would further make bold to say that your rod, in my opinion, is a trifle too long for the dexterous casting of a fly.

PS.—Humph!

VI.—And moreover, your line, to my eye, is prodigiously heavy for the light manner in which you are casting it. You are making the casting of his fish, but rather perforce than the pleasure of making fish in his sport shall arise from the skillful handling of his trout or crayling with his tackle.

PS.—Humph!

VI.—Also I think—(and here, I think, I quote) and pray, sirrah, who payeth thee for thinking and hath neglected to cure thine ears? Thou sayest varlet! dost thou undertake to instruct thy grandmother in the sucking of eggs? Why, thou malapert scrub, thou pol-wallerer, thou dolt, dost thou venture to vex mine ears with the senseless chatter? Look now, thou curvy-kaw, how I shall speak thy nose—so. And take thou this scurrilous and—this—and this—and now this study lack thee in number—thine into the brook! And so be thou then, and may thy manners be bettered by the wetting!

TRUTHFUL JEREM.

PIKE FISHING THROUGH ICE.—Oneida, N. Y., March 3. —On the 22d of last month, with a friend I went to Fish Creek, at the head of Oneida Lake, for a little fishing. Arriving at the hotel we found mine host, Spencer, of the "Forest Home," had some four holes cut and hooks ready set which we could use. After an hearty dinner, set to work. Five of us had all we wanted to do to tend forty hooks, and Thursday P. M. and Friday morning we captured one hundred and twenty-six pike, which weighed over one hundred and sixty pounds. If anybody in Central New York would like a few days' fishing next summer, they will do no better than to try Oneida Lake, Constantine being, in my opinion, the best point for bass. Some Vindictive Indians were wintered an unceasing war against trap-net, the past three years, and are to be thanked for the fine fishing, which was never better than last summer. They destroyed in one week as high as eighteen trap-nets. —E. C. W.

NEPESCON RIVER.—Indianapolis, Ind., March, 1888.—I usually get statements of the number of visitors to Red Rock after the close of the fishing season, but it was delayed, and I have only just received it for last summer. The number was smaller than the average, being only forty-two, twenty-four of which were from the "States." The catch reported averaged about sixty pounds per visitor. This is not large, nor can it ever be large if the rules of the river are observed, but it was the luck to supply fish for an Indian camp, as sometime happens. The season being cold, prevented many from visiting Red Rock last year. —H.

NATIONAL ROD AND REEL ASSOCIATION.—There will be a meeting of the association at the Metropolitan Hotel on Friday, March 10, at 2 P. M. Various interesting reports will be brought up, and it is possible that preliminary steps will be taken toward a tournament to be held some time next summer. All anglers are invited to attend.

## Fishculture.

### IMPREGNATING SALMON EGGS.

Editor FOREST AND STREAM:

I was much interested in the report in your columns of Mr. Stone's experiments on the impregnation of salmon eggs, having at various times made many similar trials myself, and as you express a wish for further reports on the same subject, I will give you a selection of my own experiments. If in some points my results do not agree with Mr. Stone's, it will be well to bear in mind that we were working with different species of salmon. Further, it is very true, as you say, that to establish a rule of procedure the trials should be often repeated. Contradictory results are sometimes obtained from what are supposed to have been identical methods; but as like will unerringly produce like, a divergence of results proves that there were some minor differences in the conditions of the experiments which were at first overlooked. Such minor sources of error can generally be selected by many repetitions carefully performed and carefully compared.

To-day I will give you the results of some experiments, all being on a single point, the one aimed at by the first three in Mr. Stone's series, namely: How long salmon eggs may safely remain in the air before the mill is applied.

EXPERIMENTS WITH SCOTCH SALMON, NOV. 17, 1877.

No. of experiments.	Spawn.	Mill.	Time in air, in hours.	No. eggs examined.	Impregnated.	Per cent. impregnated.
A. Good living fish.	Direct from living fish.	30 mins	123	121	98.1	
B. Same fish as A.	Direct from living fish.	30 mins	123	123	100	
C. Same fish as B.	Direct from living fish.	60 mins	136	123	97.9	
D. Same fish as C.	Direct from living fish.	2 hrs	50	46	95.7	
E. Same fish as D.	Direct from living fish.	2 hrs	50	46	95.7	
F. Same fish as E.	Direct from living fish.	7 hrs	59	41	74.6	
G. Same fish as F.	Direct from living fish.	24 hrs	39	37	94.6	
H. Another fish.	Direct from living fish.	2 mins	80	80	100	
I. Another fish.	Just taken from male.	0 min	135	45	41	
K. Same fish as D.	Direct from living fish.	(on 10th)	48 hrs	17	7.1	

\* This experiment will appear again in another series, which will show that the failure to impregnate was not wholly the fault of the eggs.

These eggs were placed in a vial, without water, corked tight, buried in sand under the water of the stream, and after 24 hours, after which they were treated with fresh milk from a new male.

Taken as it stands, the above would lead to the conclusion that it was much better to keep the eggs exposed to the air an hour or two, than to put them immediately. But I think I shall be able to point out in another communication the source of the error that leads to such a remarkable conclusion.

Compare H. with K. The eggs kept 24 hours, failed totally, while those of kept 48 hours almost half were impregnated. My note book says that the eggs of H. stood in a "dish without water," while waiting for the application of the mill, while those of K. stood in water, and moved, and were in a vial, and the water under water, where, of course, the temperature was uniform. It would, therefore, appear that in case of H., the eggs must have been influenced by change of temperature, or more likely been injured by the drying effect of unconditioned air, an agency that must be taken into consideration in all such cases. Leaving out of consideration H., J., and K., we should draw from the results of the other experiments, the conclusion that after the first 30 or 40 minutes of exposure to air, the eggs lose in capacity of impregnation, but that the loss is not very great for the first two hours.

CHAS. G. ATKINS.

GRAND LAKE STREAM, N. Y., Feb. 25, 1878.

### THE WISCONSIN COMMISSION.

THE ninth annual report of the Commissioner of Fisheries of Wisconsin for 1887 opens with a sketch of fishculture and a description of the State's fisheries. The buildings, tools, and appliances and the property of the State at this point, which is worth at least \$100,000, are in good repair and condition. The capacity of the institution now is 4,000,000, and it will be run to one-half its capacity, or 2,000,000, the coming year. The State has made considerable excavations in the earth, three to four feet deep, and of varying lateral dimensions, lined and bottomed with hemlock plank and supplied with screens so that the whole body of water may be drawn off, and the fish, thus exposed, afforded the opportunity of daily cleansing, and of considerable importance in view of the large amount of animal food that sometimes sinks to the bottom. A branch hatchery is being established in the building of the Milwaukee Exposition here, the latter city, which will be devoted to whitefish and lake trout.

The superintendent, Mr. James Nevin, makes a very good report of work done. He says: "The ova in the new hatchery are laid on wire trays instead of on gravel as formerly. We have at this date in the hatchery houses 1,500,000 brook trout eggs, with the expectation of half a million or more by the 1st of February. Unless some unforeseen event occurs we expect to be able to fill all orders for trout fry this coming spring. From the number of trout fry we have on hand we ought to be able to have some two hundred thousand fry to distribute during the month of June next. The Milwaukee branch of the State fish hatchery is in the basement of the Exposition building, and the new glass jar ovens can be found for the propagation of lake fish. During the past summer the hatchery has been overhauled and remodelled to harmonize with the improved apparatus for hatching, and its interior is a model of economy and convenience. The superintending hatcheryman, James Jar, makes the Holten hatching-box for the hatching of whitefish and wall-eyed pike was so apparent that the board directed their discontinuance, and authorized the purchase of one hundred glass jars to take the place of the Holten hatching-boxes, with a hatching capacity of 300,000 eggs to the jar, which makes a grand total for the holding of 20,000,000 of whitefish eggs. By this arrangement the commission saves some \$500 for help to pick and feed the eggs. The hatchery is now owned by one man, Mr. Martin O'Brien, an officer in charge. Otherwise, with the Holten box, he would require the help of four or five all winter through. These jars are 20 inches deep and 7 inches wide, with an oval-shaped bottom, with a glass tube extending down the center of the jar to within one-eighth of an inch from the bottom. The water is brought from the supply pipe by a half-inch wooden faucet, a small piece of hose connects the faucet to the center tube, and when the water is turned on, it rises in the tube, and the glass jar rises and falls with the increased volume of water the bad eggs rise and flow off, which saves a great deal of extra labor. I was not successful in getting our full quota of eggs this fall to the hatchery, but I have a strange feeling of satisfaction in the locality where we collected the eggs and not knowing where

the spawning grounds were. However, we succeeded in collecting in all seventeen millions, and will have in the neighborhood of sixteen millions of fry for the lakes this coming spring, as the eggs at this date are in extra fine condition."

An appendix contains extracts from the Michigan report, correspondence and "Statistical information" relative to the commissioners of fisheries. "We notice a trifle of carelessness in the make-up of the report, such as the retaining a printer's error in inserting a whole paragraph not intended to be printed here, and the New York report, where the title of fish culture was taken; and the publication of a two-year-old list of fish commissioners and superintendents, in which the name of their own present superintendent does not appear; other wise the report is very creditable."

### THE CONNECTICUT COMMISSION.

WE have the Seventeenth Report of the Fish Commissioners of Connecticut for 1887, also the Second Report of Shell-fish Commissioners. They call attention to the pollution of waters by the refuse of mills and factories, often lime or other bleaching material, which is deadly to fish, and quote the article on "Preventing the Poisoning of Fish by Bleaching Powder," from the *Chautauk Review*, which has appeared in our columns. The hatching and distributing of brook trout is increasing. In 1880 the number distributed by the State was 10,000; in 1881, 27,000; and in 1882, 35,000. Of land-locked salmon, over 11,000 were sold. Of the sea salmon over 265,000 were planted, 10,000 of them in Mill River, at Southport, and the remainder in Farmington River. Nearly five million shad were hatched and liberated.

The demand for carp continues to grow. Some that were only two inches long when received two years ago are now of two pounds weight, not as great a growth as in more southern waters, but fair for these colder ones. They have not been fed out, but have grown up on natural food.

The report on the shell-fisheries is somewhat larger, and contains a map of the triangulation of the Connecticut shore of Long Island Sound from the Connecticut River to Rye. The report contains much information concerning the oyster beds.

FISH CULTURE IN KENTUCKY.—Mr. Sterling, March 5. —Our fish commission has been so successful in obtaining funds could do, and work for glory, and our Senators have done all they could through our Central United States Fish Commission. We have planted in the principal waters of Kentucky, the California salmon, glass-eyed perch and Mackinac trout. In our private ponds we have also planted. The edible qualities of the carp have been called in question. "That reminds me!" Some people would grumble if they were going to be hatched; and the same party that says that a carp and a good catch (which properly cooked), most likely would snare a fish, and would do it in a minute. Now for the cooking. A carp of five pounds weight, nicely cleaned, wrapped in a towel, and cooked in a scale of boiling water. Then boil fifteen minutes; turn off the water; take out the carp, and serve it with a sauce of butter and baste as it roasts in the oven. Serve on hot dish and garnish to suit taste. Now I have eaten almost all kinds of salt and fresh-water fish, and say without fear of contradiction it is better to eat a fish, and will eat Col. Ferguson, of Baltimore, to back me. W. V. S. A. A. A. A.

THE KANSAS COMMISSION.—The Fish Commissioner of Kansas has issued his third biennial report for 1887. Many carp were stocked, and also a few of the California salmon, lake trout, land-locked salmon and shad. The total number of fish of all kinds received, hatched and planted in the waters of the State during the two years amounted to 200,000. An aquatic garden was done at the State House, and a monograph on carp and carp culture, with illustrations, by Capt. Milton P. Peirce, comprising forty pages, is also given. The latter is substantially the same as that given by Capt. Peirce in his book.

THE DELAWARE COMMISSION.—The first biennial report of the Commissioner of Fisheries of Delaware for the year 1887 is before us. As the State has just begun to take a hand in the good work and has made no appropriation for it, not much has been done except to distribute the carp received from the U. S. Fish Commission. A beginning has been made, however, and we have no doubt that the Commission will be granted the means to do more. A building house is needed and also money to do other work. The report is very creditable under the circumstances.

SOUTHERIDGE, Mass., March 5.—The Rod and Gun Club are perfecting arrangements for a weekly shoot. They have some good shots among them, and hope to make an enviable record. The few carp which they have received have been turned in one of the ponds. They also have applications for more.

### "NIGGER MIGHTY HAPPY."

PLANTATION 8036.

H O! start a-ramm'n' when de overseer callin';  
Whisperer holler when de dew-drops fallin';  
Duck-ee-a quackin' when de mule turn po'-in';  
Crows flock together when de young corn growin';  
Pig wince to squeal when de milk maw churnin';  
Nigger mighty happy when de ole overseer grinin';  
Sput' go to jump when de scaly harks comin';  
Bee-martin sail when de honey-bee hummin';  
Lean horse nicker when de punkin-rye spreadin';  
Rabbit kick his ear when de catnip-stalks beadin';  
Mooseer start a-cowarin' when de deer start runnin';  
Nigger mighty happy when de hoe-eake bakin';  
Big fish flutter when he done catch de cricket;  
Bullfrog likely when he sing in de thickets;  
Mule gal sleeker when he done eat de clover;  
Cot migh' zealy when you turn him in de clover;  
An' it come mighty handy to de nigger man water  
When he squint in de drum, wid de ole mule driver;  
Backsacke eatin' while de old ole bitches;  
Sparrow hawk bicker while de little chicken scratchin';  
Big owl when de little bird singin';  
Pigeon grine to cluck when de hawk flyin' swingin';  
Nigger mighty happy—eh he n't a't a dollar,  
When he startin' out co'tin' wid a tall tan in color."  
—J. A. Stewin, in *The Century*, "Bivouac."

A NEW FIREMEN'S DEVICE.—The Milwaukee Wisconsin is proud and happy in the belief that if the Newhall House fire were to occur again there would be little loss of life, because the firemen of the city, by the aid of the new device, the experts in the use of all sorts of fire-appliances (one scheme in particular recommends itself to every eye of imagination and experience. The plan in a future emergency will be to shoot ramrods into the burning apartments, into the burning rooms. The only danger of this is a practical question of this idea is that a terrified guest, standing in a window shrieking for help, will be very much surprised, and not immeasurably tranquilized or reassured, on finding himself subjected to a three-foot ramrod and a coil of string. And, unless the firemen of Milwaukee become vastly better marksmen than the police usually are, the probability is that not a window in the hotel will be broken, while the streets will be filled with the fire-stranger in the city, the citizens pulling ramrods out of each other.—*Philadelphia Press*.

## The Kennel.

### FIXTURES. BENCH SHOWS.

March 26, 27 and 28, 1883.—Dominion of Canada Kennel Club, Bench show at Ottawa, Canada. Entries close March 12. Charles Lincoln, Superintendent.

April 3, 4 and 5, 1883.—Western Pennsylvania Field Trial Society's Bench Show, Allegheny, Pa. Entries close March 19. Charles Lincoln, Superintendent.

April 8, 9, 10 and 11, 1883.—Western Kennel Club, Seventh Annual Bench Show, Nassau, South Garden, New York City. Entries close April 3. Chas. Lincoln, Supt.

### FIELD TRIALS.

November 19, 1882.—Eastern Field Trials Club, Fifth Annual Trials, at Fifth Point, N. Y. Entries close March 15. W. A. Coker, Secretary.

December, 1882.—National American Kennel Club, Fifth Annual Trials, at Grand Junction, Tenn. D. P. Tyson, Secretary, Memphis, Tenn.

To insure prompt attention communications should be addressed to the Forest and Stream Publishing Co. and not to individuals, in whose absence from the office matters of importance are liable to delay.

### N. A. K. C. DERBY.

FOLLOWING is a complete list of the entries for the fourth Annual Derby of the National American Kennel Club, to be run at Grand Junction, Tenn., next December. All were entered in 1882, except as noted:

1. COUNTRY VIC.—H. Bailey Harrison, Tilsburg, Ont., English setter bitch, January 8, Dick Laverack—Boll.
2. SAXON.—W. B. Gates, Memphis, Tenn., black, white and tan English setter dog, April 19, Count Noble—Bessie T.
3. LA BELLE.—W. B. Gates, Memphis, Tenn., blue belton English setter bitch, April 19, Count Noble—Bessie T.
4. LITTLE CHIP.—W. B. Gates, Memphis, Tenn., black, white and tan English setter bitch, April 19, Count Noble—Bessie T.
5. VAN HORNE.—D. C. Salmon, Dowling, Mich., blue belton English setter dog, May 21, Count Noble—Dashing Novice.
6. JOE BOWERS.—D. C. Salmon, Dowling, Mich., blue belton English setter dog, May 21, Count Noble—Dashing Novice.
7. STONE D.—D. C. Salmon, Dowling, Mich., black, white and tan English setter bitch, May 21, Count Noble—Dashing Novice.
8. NOVELTY.—D. C. Salmon, Dowling, Mich., blue belton English setter dog, May 21, Count Noble—Dashing Novice.
9. FRED H.—J. Hayward, Jr., St. Joseph, Mo., black and white English setter dog, June 6, Dash III.—Countess True.
10. LADY FAY.—J. Hayward, Jr., St. Joseph, Mo., black and white English setter bitch, June 6, Dash III.—Countess True.
11. PRIMOISE.—R. T. Vandeventer, Pittsburgh, Pa., liver and white pointer bitch, Oct. 2, Don—Luck.
12. LUCK'S BARY.—R. T. Vandeventer, Pittsburgh, Pa., liver and white pointer bitch, Oct. 2, Don—Luck.
13. MADON CROXTETH.—L. J. Pettit, Milwaukee, Wis., liver and white pointer dog, April 13, Croxteth—Lass.
14. MIKE.—E. B. Law, Chicago, Ill., red Irish setter dog, Feb. 25, Elcho—Rose.
15. BRIDGE.—Sidney Law, Chicago, Ill., red Irish setter bitch, Feb. 25, Elcho—Rose.
16. BESSIE.—W. H. Knight, Chicago, Ill., red Irish setter bitch, February 25, Elcho—Rose.
17. FAYE GLADSTONE.—Chas. Tucker, Stanton, Tenn., black, white and tan English setter dog, June 19, Gladstone—Lavalotte.
18. GRACE GLADSTONE.—Chas. Tucker, Stanton, Tenn., blue belton English setter bitch, June 19, Gladstone—Lavalotte.
19. KING HARRY.—B. T. Price, Memphis, Tenn., black, white and tan English setter dog, July 15, Gladstone—Donna J.
20. QUEEN BESS.—B. T. Price, Memphis, Tenn., black, white and tan English setter bitch, July 15, Gladstone—Donna J.
21. SUE.—H. M. Short, Atoka, Tenn., black, white and tan English setter dog, April, Prince Laverack—Native Bitch.
22. DON NELLSON.—W. F. Thurn, Lewisville, Ark., blue belton English setter dog, January 4, Druid—Nelson.
23. MAY PRINCE.—J. H. Hayes, Pittsburgh, Pa., black and white English setter bitch, February 19, Count Noble—May Laverack.
24. CORF GLADSTONE.—J. R. Henricks, Pittsburgh, Pa., black, white and tan English setter dog, April 23, Gladstone—Countess.
25. CORFESS GLADSTONE.—J. R. Henricks, Pittsburgh, Pa., lemon and tan English setter bitch, April 23, Gladstone—Countess.
26. DON OLYMPIE.—F. Huntington, Memphis, Tenn., liver and white pointer dog, March 20, Pat. Cleburn—Mag.
27. FRED.—Benj. Machauer, Trevorton, Pa., black and white English setter dog, February 19, Thunder—Peggy.
28. SUE.—Benj. Machauer, Trevorton, Pa., black and white English setter dog, February 19, Thunder—Peggy.
29. KATE S.—Benj. Machauer, Trevorton, Pa., black and white English setter bitch, February 19, Thunder—Peggy.
30. CONNY.—J. H. Hayes, Pittsburgh, Pa., blue belton and tan English setter dog, March, Count Noble—Spark.
31. JEFF D.—E. Maek, Hickory Valley, Tenn., black and white English setter dog, June 4, Gladstone—Ress.
32. GRAY.—E. W. Colburn, Honna, La., black, white and tan English setter dog, 6 months, Brussels—Jenny Lind.
33. ALICE DALE.—W. A. Buckingham, Norwich, Conn., orange and white English setter bitch, February 5, Waters's Grange—Daisy Dale.
34. ROSE DALE.—W. A. Buckingham, Norwich, Conn., orange and white English setter bitch, February 5, Waters's Grange—Daisy Dale.
35. TONY FAUST.—J. B. Rhodes, Moberly, Mo., liver and white pointer dog, July, Paul—Boudette.
36. NELLIE W.—M. P. Walter, Indianapolis, Ind., blue belton English setter bitch, 7 months, Rake—Minnetta.
37. LADY C.—B. M. Stephenson, La Grange, Tenn., black, white and tan English setter bitch, July 11, Coleman's London—Belle of Hatchie.
38. STABLE.—Elliott Smith, New York, pointer dog, August 20, Ruby—Minnie.
39. PRIGASS.—N. Rowe, Chicago, Ill., black, white and tan English setter dog, June 15, Penelope—Peg Wootton.
40. COUNTRY ELEGANT.—C. K. Drake, Burdick, Ky., lemon and white English setter bitch, March 2, Prince Loffy—Bonny Kate.
41. COUNT LOFFY.—C. K. Drake, Burdick, Ky., lemon and white English setter dog, March 2, Prince Loffy—Bonny Kate.
42. GLADSTONE'S BOY.—Dr. G. G. Ware, Stanton, Tenn., black, white and tan English setter dog, January 19, Gladstone—Sue.
43. PRINCE GLADSTONE.—P. H. and D. Bryson, Memphis, black, white and tan English setter dog, January 19, Gladstone—Sue.
44. LOTTIE GLADSTONE.—P. H. and D. Bryson, Memphis, black, white and tan English setter bitch, January 19, Gladstone—Sue.
45. DANIEL BOONE.—P. H. and D. Bryson, Memphis, black, white and tan English setter dog, January 19, Gladstone—Sue.
46. CARRON.—B. L. Mallory, Memphis, black, white and tan

English setter dog, July 11, 1882, Coleman's London—Belle of Hatchie.

48. DOT GLADSTONE.—W. L. McDonald, Tipton, Tenn., blue belton English setter bitch, July 22, 1882, Gladstone—Blaze.
49. SHADON H.—J. H. Burdick, Glasgow, Miss., lemon and white English setter bitch, May 15, 1882, Gladstone—Shadow.
50. NELLIE H.—S. Worthington, Glenora, Miss., black and white English setter bitch, April 9, Count Noble—Nellie.
51. FINE.—S. Worthington, Glenora, Miss., liver and white pointer dog, Croxteth—Royal Pan.
52. MADREX.—E. S. Wannerker, Elmwood, N. C., blue belton English setter bitch, February 23, Darkey—Rosey Morn.
53. PATRICK.—J. H. Burdick, Glasgow, Miss., black, white and tan English setter bitch, April 9, Count Noble—Nellie.
54. NELLIE R.—E. Odell, New Orleans, La., black and white English setter bitch, February 6, Rake—Meg Merles.
55. HAIN BOW.—J. H. Trezevant, Houston, Tex., black, white and tan English setter bitch, August 10, Gladstone—June.
56. LADY NOBLE.—E. Odell, New Orleans, La., black, white and tan English setter bitch, April 9, Count Noble—Nellie.
57. NELLIE R.—E. Odell, New Orleans, La., black and white English setter bitch, February 6, Rake—Meg Merles.
58. HAIN BOW.—J. H. Trezevant, Houston, Tex., liver and white pointer dog, August 10, Bow—Roxie.
59. LADY BOW.—E. Odell, New Orleans, La., liver and white pointer bitch, October 12, Bow—Tick.
60. STIRRO BOW.—E. Odell, New Orleans, La., lemon and white pointer dog, October 12, Bow—Tieus.
61. DUG.—W. L. McDonald, Tipton, Tenn., liver and white pointer bitch, February 20, Croxteth—Trinket.
62. DASH.—W. E. Hughes, St. Louis, Mo., liver and white pointer bitch, February 20, Croxteth—Trinket.
63. LADY BOW.—J. H. Trezevant, St. Louis, Mo., liver and white pointer bitch, February 20, Croxteth—Trinket.
64. LEAH.—E. C. Sterling, St. Louis, Mo., liver and white pointer bitch, February 20, Croxteth—Trinket.
65. PRINCESS TRICK.—Geo. C. Marsh, Sycamore, Ill., black and white setter bitch, February 20, Croxteth—Trinket.
66. BLANCH.—T. W. Sterling, St. Louis, Mo., liver and white pointer dog, February 20, Croxteth—Trinket.
67. KATE.—T. W. Sterling, St. Louis, Mo., liver and white pointer bitch, February 20, Croxteth—Trinket.
68. DON ROSE.—W. H. Robinson, Waluspa, Minn., liver and white pointer dog, October 20, Don—Gipsy.
69. COL. THUNDER.—A. G. Seaman, Marysville, Kan., blue belton English setter dog, May 25, Gladstone—Countess Druid.
70. PRIDE OF DIXIE.—E. E. Wallin, Montgomery, Ala., blue belton English setter dog, May 25, Gladstone—Countess Druid.
71. CLAYTON.—M. Parker, Memphis, lemon and white pointer dog, March 23, Bow—Belle of Memphis.
72. LADY BOW.—M. Parker, Memphis, liver and white pointer bitch, March 23, Bow—Belle of Memphis.
73. HOGENT.—E. Orgill, Brooklyn, N. Y., lemon and white pointer dog, April 5, Rocket—Belle.
74. RUSH OF DASH.—R. A. Brooklyn, N. Y., lemon and white pointer dog, September 22, Rush—Nan.
75. COUNTRY C.—J. Yearly, Jr., Coatsville, Pa., black, white and tan English setter bitch, March 24, Dashing Lion—Archie.
76. SAYS ROY.—H. H. Matlock, Riceville, Tenn., lemon and white English setter dog, March, Count Noble—Spark.
77. DASHING LINCOLN.—A. G. Sloo, Vincennes, Ind., blue belton English setter dog, March 24, Dashing Lion—Archie.
78. NOT NAMED.—A. G. Sloo, Vincennes, Ind., English setter dog, Count Windham—Novel.
79. NELLIE.—J. H. Crosman, New York, lemon and white pointer bitch, February 19, Sensation—Lily.
80. RUSH GLADSTONE.—J. H. Crosman, Hickory Valley, Tenn., black, white and tan English setter dog, July 18, Gladstone—Donna J.
81. FORTY.—M. A. Avant, Hickory Valley, Tenn., black and white English setter dog, July 18, Gladstone—Ress.
82. BANGOR.—E. B. Downing, Wilmington, Del., liver and white pointer dog, July 11, Bang—Jean.
83. NOT NAMED.—J. H. Kirt, New Albany, Ind., orange and white pointer dog, July 11, Bang—Jean.
84. KING BANG.—W. B. Stafford, Brazil, Tenn., lemon and white pointer dog, July 11, Bang—Jean.
85. BRACY G.—L. F. Patterson, Bainbridge, Ga., black and tan setter bitch, January 13, Coin—Beauty.
86. GAMBETTA.—E. B. Carr, M. D., Gallatin, Tenn., black, white and tan English setter dog, July 22, Gladstone—Blaze.
87. GRAND BOCKOR.—E. B. Carr, M. D., Gallatin, Tenn., black, white and tan English setter bitch, July 22, Gladstone—Blaze.
88. LUCKY-STONE.—R. M. Boyd, Racine, Wis., black, white and tan English setter dog, March 12, Gladstone—Flossy.
89. DAN ROYAL.—J. W. Rourke, Atlanta, Ga., black, white and tan English setter dog, July 22, Prince Royal—Venus.
90. FLOY.—Wm. Bowles, Jr., Memphis, Tenn., black, white and tan English setter bitch, April 23, Pride of South—June II.
91. NOT NAMED.—Wm. Bowles, Jr., Memphis, Tenn., black, white and tan English setter bitch, August 10, Gladstone—June II.
92. JIM.—Will Davidson, Niagara, Canada, black ticked English setter dog, July, Beacon—Fly.
93. FANTLESS.—C. H. Raymond, New York, blue belton English setter dog, July, Beacon—Fly.
94. MISTER E.—C. H. Raymond, New York, orange and white English setter dog, May; pedigree not given.
95. BRANDY PRINCE.—C. H. Raymond, New York, orange and white English setter dog, April, Brandy—Lemonade.

### PITTSBURGH BENCH SHOW.

I ENCLOSE a list of additional special prizes which have been offered for the show. The society are confident of having a grand exhibition. The Coliseum building is admirably adapted for a bench show, and is a great improvement over the old City Hall, as the plenty of light and air is well ventilated, beside having a spacious yard attached surrounded by a high, light board fence.

Mr. James Watson has written the secretary, saying it is impossible for him to act as secretary, the non-sporting classes, owing to business engagements, but the society have been fortunate enough to secure the services of Mr. J. F. Kirk, of Toronto, Canada.

The entries close on the 19th inst.

The following special prizes have been donated since the publication of the premium list:

1.—The Cleveland Bench Show Association, a silver cup, value \$25, for the best exhibition of sporting dogs, regardless of breed, as judged from Northern Ohio, quality to be considered in judging.

2.—J. H. Malochu, Esq., Baltimore, Md., a Gordon setter puppy, eight weeks old, by Malcolm out of Dream IV., for the best Gordon setter dog. To be competed for only by dogs owned outside of Maryland, Virginia and District of Columbia. Entry \$2, value \$50.

3.—J. J. Snellenburg, Esq., \$10 cash for best dog, bitch or puppy, of any breed, under 18 months of age.

4.—W. Lawford, Esq., Baltimore, Md., case Little's solid phenyle, through James Ken, Jr., for best setter dog, bitch or puppy, in the open class.

5.—J. W. W. Waller, Fifth Avenue, jewel casket, value \$10, for best male Laverack setter puppy under eighteen months old. Entry \$1.

6.—A friend of the Irish setters, \$10 cash for best Irish setter dog in show.

7.—Same gentleman, \$10 cash for best Irish setter bitch in show.

8.—Messrs. Grogan & Mertz, silver cup, value \$5, for best pig bitch.

QQ.—Messrs. O. M. Chutcock & Co., sheepskin mat, value \$5, for best white noddie dog or bitch.

RR.—J. R. Henricks, Esq., musical organina and music, value \$15, for best toy of pet dog owned and entered by a lady residing in Allegheny City.

SS.—J. J. Snellenburg, Esq., \$5 cash for best collie bitch exhibited with a litter of puppies. CHAS. LINCOLN, Supt. PITTSBURGH, March 9, 1883.

### LAVERACK PEDIGREES.

#### Editor Forest and Stream:

Mr. J. B. Bowers has recently made an attack on me in a contemporary, and published in support certain private letters written to him by the late Mr. Llewellyn which contain calumnies relating to me. I have dealt with the above in the following manner:

Mr. J. B. Bowers in his communication states that he continued for long terms of intimacy with the late Mr. Laverack. I could easily prove from a great number of Mr. Laverack's letters in my possession that it was not possible for anyone, being a gentleman, to long continue on terms of intimacy with Mr. Laverack.

I do not know whether I should have taken any notice of Mr. J. B. Bowers, had he not made a false accusation. Doubtless Mr. Laverack deceived him as to the ownership of the dog when he was given to him by authority the Stud Book for saying that I entered a Fairy as the trials under a wrong name, he makes a false accusation, which he certainly has the means of knowing to be false. In the report of the Vaynal Trials, in the very self-same volume of the Stud Book which Mr. Bowers quotes, Fairy is given correctly, thus proving that when her name occurs further on in the book, where she is called Fanny, it is purely a printer's blunder.

It has been pretended that I detracted the Laverack setter. The contrary I did more than any to render it famous, and I have refrained from expressing my opinion as to its faults, which I now, under provocation, allow Mr. Laverack himself to describe in his own words.

My own part, I am content, and should have remained content with giving to sportsmen a breed of setters, vastly superior to the originals, from which they were produced, but I could not allow that breed to be ruined by in-breeding, for that would have cost the fair sportsman, set up by those false pedigrees should to the ruin of my trials under the opportunity afforded by the first occasion of their being publicly accepted as authentic, to enter a protest, which has caused a thorough expose of the Laverack trials.

Be it remembered that my protest was in such that one in division of the Laverack breed was crossed, hence the verdict, which allowed those dogs which had through custom become known as "pure Laveracks," to remain as such, in consequence of my protest proved not only that one, but the whole breed crossed.

What I have taken the trouble to prove before the committee of the Kennel Club I do not intend to prove over again. Those who do not choose to accept the proof will in time have no alternative but to do so.

I shall not trouble myself to deny Mr. Laverack's charges against me, I shall merely place quotations from his letters before the public and others, against the letters I quote from, were many of them placed before the Kennel Club, his pedigrees were then proved unwelcome through his own words, and now some of the comest of his statements share the same fate.

Now see below Mr. Laverack's private opinion of his own breed, and what they would have been worth if in other hands than those he mentions. See also his change of front with regard to certain persons after he became inspired by his false pedigrees and the Llewellyns that had grown up stronger than his own.

(To Llewellyn—Saturday morning.)

"It agreeable to you I propose dedicating this book to you, viz: of Tregwyt, Mr. Haverford, West South Wales, as a tribute of respect, esteem, etc., to a gentleman who is endeavoring to restore the breed of setters, and who has spared no money, time, etc., in this pursuit."

(To Llewellyn—Oct. 15, 1871.)

"I give you and Buckell very great credit for your great perseverance. You are a man of great observation, and I can endorse all you say about the cunning displayed when out of sight, etc. Don't despair; carry on day after day when tired down and you will subdue. Remember me to Buckell, and he does deserve great credit."

(To Llewellyn—Oct. 1, 1871.)

"Your friend, Mr. Buckell, must have been in time to prepare, etc. I desire to be particularly remembered to him, and both of you richly deserve your success. Had Countess been in other hands would have been less successful."

(To Buckell—Jan. 1872.)

"Llewellyn, with all his venom and treachery, cannot injure the breed."

(To Bowers—Sept. 26, 1875.)

"Buckell and Llewellyn don't understand setters; how should they?"

Seeing that he (Laverack) cannot make head openly against the Llewellyn setter, he is driven to the petty expedient of calumny and abuse, and is a gentleman who is on back what he knows to be falsehoods in regard to Fairy and Pedigree.

(To Llewellyn—Sept. 7, 1871.)

"Privately keep quiet until spring, and you shall have the pick of some clippers."

(To Llewellyn—March 10, 1872.)

"If Pedigree and Fairy are no use to you for these Trials, send them back."

(To Llewellyn—March 11, 1873.)

"I duly received Fairy to-day by your keeper, for which I feel much obliged. I return by him a check for her, viz. £52 10s."

(To Llewellyn—Nov. 19, 1873.)

"As Fairy does not come up to your standard idea, would it not be more satisfactory, and avoid misunderstanding, for you to return her safely to me, and on receipt I will return you a check for the same you paid for her."

(To Llewellyn—March 14, 1872.)

"If Pedigree is useless for Trials send him back."

(To Bowers—Jan. 20, 1874.)

"The articles of Llewellyn and Buckell show the petty malignity of envious men, and all owing to my not letting him have the services of my Pedigree and not selling him Fairy."

(To Bowers—Feb. 3, 1874.)

"The sole cause of my animosity is my refusal to let or sell him Fairy and refusing him for love or money the services of her brother Pedigree."

The following clearly shows the truth of what the editor of the London Field stated some years ago, to the effect that Laverack habitually claimed everything that was good to his own, and repudiated whatever he did not find it convenient to acknowledge, although knowing it to be his own. Thus we see early in 1875 he claims the Laura and her owners as well as a very few months later, after he has failed to make people swallow it, he finds out that they are truthfully faulty, and abuses them as though he had been bitten by them.

By the way, how his fear and jealousy of Dan shows itself through all this.

(To Bowers—Feb. 3, 1874.)

"The sole cause of Llewellyn's vindictive animosity is,

Kelden and Stoddard respectively won second and third prizes. —J.

LONDON GUN CLUB. London, Oct. 1894. The annual

LONDON, WEDNESDAY, 14th March.—The Annual meeting of the members of the London Club Club, was held on Monday evening, 5th of March, to organize for the coming year. The following officers were re-elected: President, D. Skirving, Esq.; Vice-President, R. Wallace, Esq.; Secretary-Treasurer, A. G. Chisholm, Esq. Afterwards a vote of thanks was passed to Mr. A. S. Murray, for his kindness in presenting a valuable cup to the member making the best average score during the season. This cup was won by the

president, Mr. Stirling, after a hard struggle. The club is in a good financial position, having a large balance to its credit. After making arrangements for the season the meeting adjourned.—A. G. C.

**PITTSBURGH TOURNAMENT.**—Pittsburgh, Pa., March 10.—A grand shooting tournament will be held in this city during bench-shooting week. The guaranteed prizes amount to five hundred dollars.

*Answers to Correspondents.*

**✂ No Notice Taken of Anonymous Correspondents.**  
B. A. J. — Yes, the gun is strong and reliable.  
W. M., Jr., Boston, Mass. — For wild rice supply, see our advertising columns.

J. F. W., Talladega, Ala.—For wild rice supply, see our advertising columns.

S. & T., Providence, R. I.—For buffalo heads for mounting, write to parties named in answer to F. J. C.

L. C. C., New York.—Will you kindly give me the name of the game and fish warden living at Rochester? Ans. G. M. Schwartz.

J. E. H., Phillips, W. Va.—The combination gives general satisfaction, so far as we can learn, and you will doubtless find the arm suited to your purpose.

C. M. P., Scranton, Pa.—The term "2yds. rise" means that the trap is placed at a distance of 2yds. from the shooter. We do not know Dr. Carver's address.

F. J. C., Concord, N. H.—For birds' eggs write to Wallace, taxidermist, William street, New York, or to Bell, 355 Broadway, New York, or to F. Sauter, 199 William street, New York.

Typo, Falls City, Neb.—Will a short barreled gun shoot as well as a long-barreled one? Ans. Within certain limitations of difference there will be no practical difference in field work.

A. F. S., Hastings, Minn.—The rifle mentioned is a standard first-class arm, but we cannot compare its relative merits with others. It will answer all legitimate purposes. Sells at \$500.

H. R. G., Kittanning, Pa.—How large should English setters grow? Ans. They vary greatly. A medium-sized dog is of about 50 lbs. weight. We have seen them of all weights from 30 to nearly 100 lbs.

D. R., Montreal, Canada.—Will a gun with two sets of barrels of the following dimensions, viz.: 10-bore, 32in., and 10-bore, 26in., be balanced when using either set? Ans. You could have such a gun made to balance by selecting heavy 26in. barrels and light 32in.

H. D., Baltimore.—1. Would I, not knowing the points of an Irish

setter, he able to distinguish a good specimen of the breed by having a book on their points? 2. What is the best work on the judging of the Irish setter and what is the price of it? Ans. 1. Probably with a little experience. 2. "The Dogs of Great Britain, America and Other Countries," price \$2.50; we can furnish it.

J. E. Riverside, Cal.—Will you please inform me where, and at what price I can obtain Bidgway's "Natural History of North America."

W. H.—I. is a straight stern, made for hanging a ruler, a defini-

ment to a travel agent? 2. What type of canoes are considered the best for general traveling and sailing, the old "Rob Roy" or the modern straight bow, like that in Joyner's advertisement? 3. Can I get back numbers of your paper? Ans. 1. Straight post to canoe is no detriment. 2. Best canoe for general service is of the medium type; can be had from any of our advertisers. 3. You can get back numbers.

**OSTRICH FARMING.**—In reply to several queries we quote from a San Francisco exchange, the *Call*, of March 3: "A company, with a capital stock of \$30,000, has been incorporated under the name of the California Ostrich Farming Company. A tract of 640 acres, part of the old Abel Stearns ranch, near Anaheim, Los Angeles county, has been secured, and will be placed under the superintendence of Dr. C. J. Sketchley, who has had considerable experience in ostrich

farming in South Africa. One of the ostriches at Woodward's Gardens has commenced laying. Her eggs weigh three and one-half pounds each."

ONLY ONE MATCH.

A RESIDENT of Indiana has received the following letter from a friend at English Lake, Indiana: I have not had time till now to write you about John's adventure up the lake that terrible night. This is the way that Johnson was prevented from getting down the lake: He had noticed that the floating ice in the river was hard when he went up in the morning, and that it became soft and mushy in the afternoon. He thought that the lake would be partially open and the ice soft, so that he would have no difficulty in pushing through it. Everything went along smoothly until he struck the ice near dawn, and he was forced to go back. He had about two miles to go, and he was very tired. He was still daylight when he got there. He took in the situation at once, and said to Bell, the man that was with him, that it would be impossible to get down the lake that night; that it would be their death to undertake it. The weather was getting intensely cold, and the drifting snow was so dense that he could scarcely see the length of his boat ahead of him. They were about two miles from the north bank of the river; there was nothing for them to do but to turn the boat and seek shelter in the woods. Here they encountered much difficulty, as the boat could be scarcely moved on account of the ice and snow that had been frozen to it, and the river was so deep that Johnson had to put his hands down into the water so that the paddle would reach the bottom. They were fully fifteen minutes in getting to the shore. By this time it had become quite dark and bitter cold, with the snow setting down in torrents. They did not feel like making a fire, as they feared from the wind and to make a fire. An examination revealed that they had but one match.

The situation was getting desperate in the extreme, and a pitiless night before them. The boat was dragged a short distance into the woods. Johnson then dried off the decks with a paddle, took off his rubber coat, and crawled under the boat and whittled the deckboard into thin shavings upon the other coast; then taking his oil gun rags from his cartridge case, he soaked them with kerosene, and then used the match until he had exhausted other means, he proceeded to obtain fire by extracting the shot from some of his shells and putting dry rags therein, also putting rags in the barrel of the gun. In this way he tried several times to get fire by shooting under the boat, but did not once succeed in lighting the rags. By this time they were nearly frozen. The time had come when they were to give up the match. They could delay no longer and live, for they were perishing. Johnson told me the next day that he felt that their lives depended upon the match, that if it went out for half an hour to get a fire with the gun without great it upon the match was their last resort. Johnson again crawled under the boat to arrange the rags and shavings upon the rubber coat, and to keep the fire from going out. He imagined that the coat was damp and cold and might extinguish the fire, so he called to his friend to empty his shell-box and hand it to him. This being done, he carefully gathered his shavings and rags into it. Though already suffering with the intense cold, Johnson and Bell took off their outer coats and stuffed them under the windward side of the boat, between the gunwale and the ground, to prevent the possibility of the wind putting out the match when ignited.

This cautionary notice, telling the awful consequences of a failure, Johnson weakened and faltered and asked Bell to

strike the match, which Bell lacked the courage to do; so, with his fingers huddled and nearly frozen, Johnson took from his rubber coat the solitary match upon which the lives of two souls depended, and, with trembling hand he at first struck, oh, so carefully, on the end of the match-safe. The second strike less gentle than the first. The third strike, with more vigor, ignited the match, and they were safe. The rags and shavings in the shell box immediately took fire. A few dry twigs and limbs were immediately added. Near the boat was a hollow ash tree, and to this the shell box with its precious contents was conveyed. In another minute the ash tree was in flames from top to bottom. Other trees and stubs were set on fire. They kept as many as four or five fires burning at a time, during the whole night, so if the snow should extinguish one there would be others left. On account of the difficulty of getting a supply of fuel, they having no ax or hatchet, and nearly all the dead limbs lying on the ground being frozen into the mud, it became necessary to set fire to a willow tree when one could be found. Consequently the fire extended over two acres of ground. About 2 o'clock in the morning the faintest dawn asserted itself. A mallard was picked and cleaned and broiled. There was one piece of frozen bread and some salt left in the lunch box, which served as food purpose. The voyagers broke camp at 8 o'clock in the morning, walked down the lake over the ice, and were soon at the house. Johnson had one ear frozen and his clothes badly ruined. Bell was nearly done for. He slept all that day and night, and he and Johnson were home on the next day. They heard our guns when we fired, and were repaid by shooting also, but, as you are aware, we did not hear them.

POT LUCK FROM OUR EXCHANGES.

The Russian General Ignatieff is now living near the Winter Palace in St. Petersburg. A correspondent says: "The Russian General Ignatieff has a collection of historical arms, unique of their kind; each piece has a tradition, and each is marked by rich and curious workmanship; all have been given to him at one time or another by their owners. For instance, one sees the pistols of the last Sovereign Prince of Albania, a long poniard of Selim, and a gun richly chased presented to him by the Sultan Abdul Aziz."

The good observer of nature exists in fragments, a trait here and a trait there. Each person sees what it concerns him to see. The fox-hunter knows pretty well the way and habits of the fox, but on any other subject he is apt to mislead you. He comes to see only fox, fruits in whatever he looks upon. The bee-hunter will follow the bee, but lose the bird. The farmer notes what effects his crops and his earnings, and little else. Common people, St. Pierre says, observe without reasoning, and the learned reason without observing. If one could apply to the observation of nature the sense and skill of the South American *rastreador*, or trapper, how much he would track home. This man's eye is keener than a hound's scent. A negative can do no more elude him than he can elude fate. His perceptions are said to be so keen that the displacement of a leaf or pebble, or the bending down of a spire of grass, or the removal of a little dust from the fence are enough to give him a clue. He senses the half-vanished foot-print of a thief in the sand, and carries the impression in his eye till a year afterward, when he again detects it in the suburbs of a city, and the culprit is tracked home and caught. I knew a man blind from his youth who not only went about his own neighborhood without a guide, turning up to his neighbor's

gate or door as unerringly as if he had the best of eyes, but who would go many miles on an errand to a new part of the country. He seemed to carry a map of the township in the bottom of his feet, a most minute and accurate survey. He never took the wrong road, and he knew the right house when he had reached it. He was a miller and fuller, and ran his mill at night, while his sons ran it by day. He never made a mistake with his customers' bags or wool, knowing each man's by the sense of touch. He frightened a colored man, whom he detected stealing, as if he had seen out of the back of his head. Such facts show one how delicate and sensitive a man's relation to outward nature through his bodily senses may become. Heighten it a little more, and he could forecast the weather and the seasons, and detect hidden springs and minerals. A good observer has something of this delicacy and quickness of perception. All the great poets and naturalists have it. Agassiz traces the glaciers like a *rastreador*, and Darwin misses no step that the slow but tireless gods of physical change have taken, no matter how they cross or retrace their course. In the obscure fisherman he sees an agent that has kneaded and leavened the soil like giant hands.

-Geddy.  
It is a noticeable fact that the wholesale and wanton destruction of the forests in the northern counties is having a marked effect upon the annual rainfall and is seriously affecting the navigation of the Hudson River. The bill presented is a wise measure, suggestive of statesmanship of a comprehensive order. There is no subject to which the attention of the public should be more frequently called. The destruction of the forest lands in the Adirondack region is a menace to the Empire State. Every falling tree is a presage of drought. When the trees grow no more, the waters will descend, except upon the occasion of destructive storms. The felling of timber is the banishment of moisture. Every raft which floats lazily down the stream is an eloquent prophecy of drought and famine for future generations. Every blow of the axe upon the living tree is the knell of a drop of life-giving water. The moaning and crackling of each falling oak is a dirge and requiem for the loss of productive power. The buzzing saws, which hum and whiz through the inanimate logs, are but teaching the lesson of irreparable loss. -*National Republican*.

For some time the reckless use of firearms on and about the Yale campus has caused considerable comment. A shot entered the dining-room of a professor of mathematics, who has made the study of curves a specialty. He was determined to find out the reckless student, and he brought his mathematical knowledge into play. Knowing the breadth of the room, he measured the fall of the bullet in crossing it. Then he measured the distance from his house to the West Divinity building. With these data, and knowing the curve which a bullet takes, he computed the height from which the shot was fired, and fixed upon the very window from which the bullet must have come. The next day two students were greatly surprised by a call from the professor, who accused them of firing the shot. They denied it and the professor gave his proof. The proof was so strong that they finally admitted their guilt. A young lady tells of a plump dog in a family where she was making a visit, which she trained to lie under the table as a foot-stool. Now, whenever a chair is placed at that part of the table the dog locates in front of it, but cannot be induced to remain unless the young lady occupies the seat.

Tested by Time. For Throat Diseases, Colds and Coughs, Brown's Bronchial Trochans have proved their efficacy by a test of many years. Price 25 cents.-*Ad.*

**The Celebrated "Fluted" Spoon Bait.**  
Length of the Spoons of the various sizes:  
INCHES, NOS. 1 1 1/4 1 1/2 1 3/4 1 7/8 2 1/4 2 1/2 2 3/4 3 1/2 4 1/2 5 1/2 6 1/2 7 1/2 8  
ABBEY & IMBRIE  
NEW YORK  
FLUTED BAIT PAT.  
U.S. & CANADA 1876  
(Above cut shows exact size of No. 6.)  
We make these baits either treble-plated silver or extra heavy gold plated. The gold plated at a small advance in price. They are to be had either way of any first-class dealer in fishing tackle. The great and deserved popularity of these baits has induced some dealers to offer poorly made imitations which sometimes deceive anglers, but never deceive fish.  
Orders received from persons residing in cities in which the dealers keep a full line of our goods will not be filled at any price.  
**ABBEY & IMBRIE,**  
Manufacturers of every description of Fine Fishing Tackle. 48 Maiden Lane, New York City.

No Rubbers Needed. Leather Keep Dry. Applied without heat, cures the hardest leather, makes your boots waterproof, and adds one-half to their durability. A few hours after applying a polish can be made over it with shining. No sportsman should be without it. Price 35c per doz. 1/2 bottles. Sent on receipt of money order to any address. Liberal discount to buyers in large lots. Also fully endorsed by Forest and Stream and thousands who use it. G. L. BROWN, Sole Agent, 125 Federal Street, Boston, Mass.

NEW EDITION.  
**Canoe and Camera.**  
With sixty illustrations, and a new map of the canoe routes of the State of Maine.  
PRICE \$1.50. FOR SALE AT THIS OFFICE

**Schwatka's Search.** Kynoch's Patent "Perfect" Brass Shells  
Sliding in the Arctic in quest of the  
FRANKLIN RECORDS.  
BY  
WILLIAM H. GUILDER,  
Second in Command.

Price, 3.00.  
For sale by the Forest and Stream Pub. Co.

**The Maynard Rifles and Shot Guns.**  
NEW OFF-HAND TARGET RIFLE, MODEL OF 1881.  
PRICES REDUCED.  
WITH PISTOL CRIP STOCK, TIP STOCK, AND SWISS BUTT PLATE.  
For Hunting and Target Practice at all ranges, the "MAYNARD" more completely supplies the wants of Hunters and Sportsmen. No other Rifle in the world, as many barrels can be used on one stock; and for accuracy, convenience, durability and safety, is not excelled. Send for Illustrated Catalogue describing the new attachment for using rim and centre-fire ammunition.  
**MASS. ARMS COMPANY, Chicopee Falls, Mass.**

These shells are made of extra fine thin pliable metal, with reinforced base. Use either Winchester or Wesson primers. Can be reloaded as often as any of the thicker makes. Cost only about half as much. Weight less than paper shells, and in consideration of their reloading and other advantages, are really cheaper than the paper. They also shoot stronger and closer, and can be loaded heavier, as inside diameter is nearly two gauges larger. They possess a great advantage over all other brass shells, as owing to the thin metal they can be closed (or presented in cut) by simple use of the thumb wide and favorable reputation in Europe, and in the opinion of many prominent sportsmen, will soon supersede to a great extent the style of both brass and paper. Samples will, upon application, supercede to a great extent the style of both brass and paper. Samples will, upon application, be sent in any quantity by gun dealers generally, or in case lots only (\$3,000 shells) by  
**HERMANN BOKER & CO.,**  
SOLE AMERICAN AGENTS. 101 & 103 Duane Street, New York.  
WILLIAM READ & SONS, Boston, Mass., Agents for New England States.  
We also carry a large stock (at all seasons) of Kynoch's regular thickness brass shells, adapted to the Berdan Primer. Price materially lower than the American make of same quality.

# FOREST AND STREAM.

## A WEEKLY JOURNAL OF THE ROD AND GUN.

TERMS, \$4 A YEAR. 10 CTS. A COPY.  
SIX MONTHS, \$2.

NEW YORK, MARCH 22, 1883.

VOL. XX.—No. 8.  
Nos. 33 & 40 PARK ROW, NEW YORK.

### CORRESPONDENCE.

THE FOREST AND STREAM is the recognized medium of entertainment, instruction and information between American sportsmen. Communications upon the subjects to which its pages are devoted are respectfully invited. Anonymous communications will not be regarded. No name will be published except with writer's consent. The Editors are not responsible for the views of correspondents.

### SUBSCRIPTIONS.

May begin at any time. Subscription price, \$4 per year; \$2 for six months; to a club of three annual subscribers, three copies for \$10; five copies for \$16. Remit by registered letter, money-order, or draft, payable to the Forest and Stream Publishing Company. The paper may be obtained by newsmen throughout the United States and Canada. On sale by the American Exchange, 449 Strand, W. C., London, England. Subscription agents for Great Britain—Messrs. Samson Low, Marston, Searle and Rivington, 183 Fleet street, London.

### ADVERTISEMENTS.

Only advertisements of an approved character inserted. Inside pages, nonpareil type, 35 cents per line. Special rates for three, six and twelve months. Reading notices \$1.00 per line. Eight words to the line, twelve lines to one inch. Advertisements should be sent in by the Saturday previous to issue in which they are to be inserted. Transient advertisements must invariably be accompanied by the money or they will not be inserted. Address all communications,

Forest and Stream Publishing Co.  
Nos. 39 and 40 PARK ROW. NEW YORK CITY.

SEA AND RIVER FISHING.	ANSWERS TO CORRESPONDENTS.
Two Sonnets.	

With its compact type and in its permanently enlarged form of twenty-eight pages this journal furnishes each week a larger amount of first-class matter relating to angling, shooting, the kennel, and kindred subjects, than is contained in all other American publications put together.

BACK COPIES OF THE FOREST AND STREAM can be supplied.

### SAINT SALVELINUS.

ON the first day of April the brook trout season opens in California, Connecticut, Massachusetts, Minnesota, New Hampshire, New Mexico, New York, Pennsylvania, Virginia and Washington Territory. Other States and Territories make the season open earlier or later. In parts of the State of New York no trout fishing is done until May, but in the city the anglers look forward to the opening day as the coming of an annual festival. Long Island trout are early, owing to the fact that the ice is usually out of the streams early in March, and on the first day of April there is an exodus of New York city anglers to the island.

This year the opening day comes on Sunday, and we know of a score of enthusiastic anglers who will go down on Saturday night in order to be on the ground early on Monday morning, and who will fish on that day, no matter what sort of weather may be dealt to them.

At the South Side Sportsman's Club the members are feeling of their rods, oiling their reels and looking after frayed gut and moth-eaten flies. The well-stocked preserves of this club promise much sport in the way of extra-sized trout. All along the island from Shinnecock Bay to Canarsie on the south side, and from Port Jefferson to Whitestone on the north shore, there is a bustle of preparation that denotes a vigorous opening of the campaign. For our own part we usually prefer to wait until the blustering March winds have blown themselves out and there is no danger of one's marrow being solidified by a blizzard from Manistoba, which goes through a spring overcoat like a black-fly through a patent fly-net.

In Fulton Market there will be a goodly display of trout from all parts of the country, and also from abroad. Mr. Blackford has been quietly arranging for his yearly display,

and no doubt it will be equal, if not superior, to his former efforts. Trout and flowers are the attractions at Fulton Market on "trout opening" day, and they harmonize well together; gems of the land and of the water, the condensed poetry of the earth and the streams which flow upon it. Anglers, who do not go down to the seashore to take the trout from the streams, should not miss the sight of the beauties in the market, where their differences, caused by food and water, are better studied in an hour than by a lifetime on the streams.

### THE NATIONAL PARK.

A FEW newspapers, whose proprietors were interested in the attempt to capture the Yellowstone Park, are whining about the Government's loss of rent on the lands leased for hotel purposes. To these splenetic grumblers Mr. Assistant Secretary Joslyn adds his voice, and the querulous moans of the defeated gang are laughable to listen to. They say that if the original forty-five hundred acres that the Improvement Company so longingly reached for had been leased to it, the annual revenue to the Government would have been \$9,000, whereas it is now only a pitiful \$80. This is very true, but whether the loss of the \$8,920 to the United States Treasury is as serious a matter as these sad-voiced scribes would have us believe is open to a little doubt. If the Interior Department had, as it seemed at one time likely to do, bartered away all the rights of the people for ten years to this lovely spot for \$9,000, would it not have been thought that these dollars had cost the nation dear? We think so. It is to be expected that the vanquished will continue for a while to lift up their voices in sorrowful ululations. They still feel the effects of their beating. But life is too short to be devoted to such dead issues as the Park grab. The Improvement Company may yet try to seize on portions of the reservation, but it is for the officers of the Government to look out for this matter. The law is on the side of the people.

The Secretary of the Interior has, we are happy to say, called on the War Department for a detail of troops to guard the Park and its game, and this detail Secretary Lincoln has promised to furnish. Things are, therefore, marching along in a very satisfactory shape.

A dispatch to the public press credits Superintendent Conger with the statement that the reports to the effect that game was being killed within the Park are untrue. It may be that just at present the slaughter has ceased, but we can assure Mr. Conger that a short time ago, and during the progress of the fight against the encroachments of the Improvement Company, game was being killed in the Park and in considerable quantities. All this sort of thing must now cease, and we look to Superintendent Conger to see that it is put an end to at once and forever.

With the opening of the next session of Congress we hope to see a bill introduced embodying the essential features of Senator Vest's bill of last session, and providing for the enlargement of the Park on the east and south, as suggested by us recently. All who are familiar with the region are agreed that such increase in area is most desirable, and we trust that within a year it may be made.

NEW YORK FISH COMMISSION.—A bill has been introduced into the Legislature of New York forbidding any person who deals in fish to be a Commissioner of Fisheries. As there is no good reason for such a proscription it is evident that it is aimed at Mr. Eugene G. Blackford, who is both a fish dealer and a fish commissioner. The same bill was introduced last winter, and it is believed to be instigated by a man who was once in the employ of Mr. Blackford, but who was discharged for dishonest practices in connection with the capture of trout out of season, while pretending to do other work. The fact that Mr. Blackford is a large fish dealer and one who has paid much attention to fishculture and kindred subjects, fits him to be a commissioner of fisheries in a degree that no other man in the State is fitted, and the introduction of such a bill shows its animus. Last winter when the same bill came before the Legislature, the late George Dawson said to us, in a private conversation: "Why, you might as well pass a law that no man should be a professor in a college who is qualified to teach!" That such laws, framed to gratify a personal spite, will pass we have not the slightest idea, we only wonder why our legislators introduce them. The fish commissioners serve without pay, and none but those who have the best interest of the public at heart would burden themselves with the office. Mr. Blackford's well-known public spirit and his knowledge of the habits and values of fishes are of the greatest service to the New York Fish Commission.

### "AMERICAN KENNEL REGISTER."

THE necessity of a printed register of the breeding of fine stock is thoroughly appreciated, and for most kinds of stock, horses, cattle, sheep, etc., such records are regularly published. The demand for a similar promptly published registration of dogs is urgent and is becoming more imperative with the lapse of each succeeding month and the increase in the number of sporting and pet dogs. At the request of some of the prominent breeders of the day the Forest and Stream Publishing Company have undertaken the task of supplying such a record and will at once begin the publication of the *American Kennel Register*.

It is of the utmost importance for the convenience of all breeders, and owners and purchasers of sporting dogs, that there should be ready access to the pedigree and record of the stock in question; and this can be secured in no way more conveniently than that now proposed. The *American Kennel Register* will be published monthly in convenient shape for filing and binding in an annual volume. Its main feature will be the register of names and pedigrees and the supplying of a number to each dog entered. There will be also registers of "bred," deaths, sales, etc., all fully indexed under each breed at the end of the volume.

In addition to this registry, there will be given complete prize lists of all American dog shows and field trials, with summaries of such foreign shows and trials as may be deemed important; and a monthly compendium of all matters of interest in the canine world. The aim of the publication of the *American Kennel Register*, in short, will be to make it a *code meum* for breeders and owners.

The initial number will be published early in April. Fuller particulars will be given in our next issue.

### A BAD BILL.

TWO provisions of the O'Connor bill to amend the game laws of this State are most unwise. One opens summer shooting; the other extends the market time. The law is much better as it stands than it would be if tinkered as this bill proposes to "fix it." The bill bears very good evidence of having come through the same manipulation that not long ago produced the notorious "refrigerator amendment," in fact it comes from the same source. Section 24 provides that venison and grouse may be sold for two months after the lawful killing season has expired. Every man of ordinary intelligence knows what that means. It means that for two months game will be killed out of season and smuggled into market. This game will come from New York and from other States in which the markets have been closed. This State and others are expending money in salaries for game commissioners and wardens and detectives, and the originators of the O'Connor bill with their extended market hold out fresh inducements to the poachers.

The market ought to be closed when the killing season closes. The framers of the bill in question know this. The probable reason why they have not acted on the knowledge is that they are attempting to serve two masters. They want to make a "game law" that will answer the purposes of the market men. The market men want all the game there is, and they want it now. The O'Connor bill framers are perfectly willing they should have it; and if the bill passes, it will be just one advance in their favor. We do not believe that the O'Connor bill was framed in the true interests of sportsmen and game protection. It bears the signature of the men in this city who advertise for snared game birds, and of the hotel proprietors whose kitchen back doors are always ajar for the sneaking midsummer slayers of immature game.

### THE LONDON FISHERIES EXHIBITION.

THE American Commission will sail from Philadelphia on the 21st of this month on the steamer Lord Gough. It will consist of Prof. G. Brown Goode, Deputy U. S. Fish Commissioner; Mr. R. E. Earl, in charge of fishculture; Capt. J. W. Collins in charge of nets, boats and marine fisheries; Mr. Joseph Palmer, taxidermist; Mr. Reuben Wood, in care of the angling exhibit; a secretary, and perhaps others. Mr. Wood will remain in London until July 1, and then take a trip to the salmon rivers of Scotland. We hope that "Uncle" Reuben will remain over until the annual tournament of English anglers takes place so that he may be able to see how they conduct those things abroad, and if there are any points worth adopting our National Rod and Reel Association may have the benefit of his experience.

## THE ADIRONDACKS.

THE State of New York has been very remiss in not caring for the large tract of land, larger than the State of Connecticut, which is popularly known as the Adirondacks. It has sold land to lumbermen at a nominal sum in the vain hope that it would get into the hands of men who would pay taxes on it and so bring in a revenue to the State. This hope has not been realized. The lumbermen have bought large tracts, in some cases as low as five cents an acre, and after skinning it have allowed it to revert to the State for non-payment of taxes.

A bill has just been introduced into the Legislature authorizing Mr. Verplanck Colvin, Superintendent of the Adirondack Survey, to locate the detached portions of State lands with a view to the preservation of the forests, and the laying out of the boundary of the proposed State reservation in that region. It needs no argument at this time to show how these vast woods shelter the sources of the Hudson and give off the water gradually which, if the forests were removed, would come down in floods and sweep over the cities in the valley, as has lately been done in the West. We hope this bill may pass and protect the water supply of our rivers and canals before it is too late.

The forthcoming report of Mr. Colvin will be looked for with great interest. It will contain important maps, records of horizontal measurements of lines and the determination of the latitudes and longitudes, etc., of lakes, mountains, villages, and the corners of the great land patents. It will also give scientific papers on forestry, rainfall, water supply for New York and the cities of the Hudson valley, descriptions of the fish found in the region, and an historical and descriptive account of the Adirondacks, as well as an official list of the several pieces of State lands, amounting to 573,872 acres, with details of their location. This will make it a volume of exceptional interest, and one that the Legislature will do well to have widely distributed. The State cannot afford to treat the Adirondacks with the neglect that it has done. Already the Hudson River has hardly a steamboat channel in midsummer, where fifty years ago there was plenty of room for the sailing craft that carried the commerce of the upper Hudson.

## HORSES IN HOMER'S TIME.

THE ancient Greeks and the Trojans as well made great use of their horses in battle. Among these people the horse was as thoroughly domesticated in Homer's day as he is anywhere at present. Apollo looking down from Pergamos and urging the Trojans to fight calls them "the trainers of steeds." (II. IV., 506.) Elsewhere they are distinguished as those employing horses in battle. Diomed, a champion of the Greeks, is commonly addressed in a respectful way as a "tamer of horses." Horses were used in battle only when harnessed to the car. Thus Hector was driving to the field with his fleet steeds yoked to the chariot, when he reminded them of the wheat they had eaten from the gentle hand of his wife Andromache, and of the wine that had been mixed for them to drink as though they had been the favored guests of a luxurious house; and he called upon them by noon that day to prove themselves worthy of such favor.

Speaking after this way, he called to his steeds and addressed them; Xanthos and you, Podarge, and Aithon and Lampos divine one. Now repay me the cost of your keeping, which in abundance—Andrache, who was child of Ection, the crook-hearted, Put in your crime for your food as much as lighting the palate. Mixing wine for your drink whenever you should feel thirsty. Before bringing dinner to me who am proud of being her husband. Hastily make the pursuit to see if perchance we may capture Shield of Nestor, which now to the gods is familiar in story, S it is to be worthy of gold—the body and even the handles. And from the shoulders may strip of Diomed, tamer of horses. Breastsplate skillfully wrought—Hephaistos toiled at its making. If only these two we take, then—hope can I have the Achæans This very night for retreat will go on board their swift vessels. (II. VIII., 154-197.)

Hector calls his horses by their names which will be found expressive, and as appropriate as any pet names a modern jockey would find in English for his favorite steeds. There was Xanthos, the yellow-coated one, named after one of the horses given by Poseidon to Hera, and his yoke-fellow was Podarge, so called from the nimble movement of her feet. Next was Aithon, the fiery, named either for his bright color or for his impetuous spirit. This name had been borne by one of the horses of the sun. Last of all Hector calls on Lampos the divine, whose name is the same as that given to one of the horses of Aurora who brings the light of day to mortals. (Od. XXIII., 216.) These names of Hector's horses, and the many others which Homer makes famous by his verse, will remind the reader of Virgil of the name that poet gives the horse upon which Dido was mounted when she joined the hunting party. Its equivalent in English would be Foot-of-Sound. This is commonly taken as a mere epithet describing the horse by the heavy sound with which he strikes the pavement with his feet; that is, the horse of the sounding hoofs. But the queen's horse was a palfrey for gentle ride and of easy step, and it seems better to understand the poet as giving it a proper name, and calling it Foot-of-Sound to indicate the speed and ease with which it traveled.

The horses of Achilles were two, Xanthos and Balios, immortal steeds which Poseidon had given to Peleus. These were groomed and fed with a care no less assiduous than that bestowed by the gentle hand of Andromache. Often such care was shown by their master's comrade Patroklos,

and this we may suppose was the reason why at this hero's death these steeds so sensibly felt his loss. From his hand were they accustomed to receive their provender, and he used to wash their limbs with pure water, and pour the generous oil over their glossy manes. (II. XXIII., 281.)

Horses of Aiakides, aloof from the battle-field standing, Wept as soon as they had intelligence of their driver Having fallen in dust at the hands of man-slaying Hector. Surely Automedon, the stout-hearted son of Diores, Often with quickening whip used to urge them on with his lashing, Often with coaxing tones he spoke, and with threatenings often. Now no more to the ships on the shore where the Hellespont broadens, Longed the horses to go, nor to battle with the Achæans; But as a pillar remains firm fixed which has been erected Over the tomb of a man deceased, or that of a woman. So do the steeds wait and hold unmoved the beautiful carriage, Drooping their heads to the ground, more over tears that were wealding.

Fell from the horses' lids to the soil as they were lamenting Loss of the charioteer, and their flowing manes were polluted, Having escaped from the hand, and the yoke on both sides over-hanging; Seeing these two shedding tears, the son of Kronos felt pity. Nodding and shaking his head he talked with himself and he queried: Ah, me! why did we make you a present to Peleus the royal, Him who is mortal, while you are both free from age and undying? Was it that you among men most wretched should suffer misfortune? For there is not anywhere than man a more pitiful object. Of all, as many as breathe and crawl upon the earth's surface, Surely not by yourselves, and in chariots skillfully fashioned, Hector, of Priam the son, shall be drawn, for I will forbid this. (II. XVII., 439-462.)

The former of these two horses of Achilles was gifted by the favor of Hera with speech and with prophecy. The death of its master was foretold with confidence, and with too certain fulfillment. (II. XIX., 400.) This cannot fail to remind of the experience of Balaram as told in the Hebrew scriptures, the practice of the Persians to keep horses for purposes of divination; and what Tacitus says of the same practice being common among the Germans in his day.

The horses of Diomed had served to them for provender wheat which was sweet as honey. (II. X., 568.) This was fed them before going to battle. So, too, near by each of the eleven cars belonging to Lykoon stood a span of horses feeding upon white barley and rye. (II. V., 106.) When in camp and idle, the steeds of the heroes were kept on less expensive food. While Achilles was encamped apart from Agamemnon, indulging his resentment, the horses stood unyoked about the chariots munching the lotus plant and the meadow-nurtured parsley. (II. II., 775.)

It is worthy of notice that those portions of Greece abounding in meadow lands are such as were the favorite pasture grounds for horses. It was Argos abounding in springs, and Thessaly watered by mountain streams, that were famed for their steeds in Homer's day. This is a fact that should be taken into account by those who attempt to show that the intellectual and political deterioration of that country is due to the increased dryness of its climate. When Telemachos was about to leave Menelaos whom he visited at Sparta, his host presented him with three horses and a well-polished car, but the youth declined the present on the ground that Ithaka was fit only for the browsing of goats.

As to the gift you would make, pray let it remain as a keepsake. These horses I will not take into Ithaka, but in your keeping. Here will I leave them as pets, for you of a plain are the owner. One that is broad and in which grows lotus and hay from the marshes, Wheat and the kernels of maize; the white and the wide-spreading barley. Broad roads has Ithaka none, nor has it the least bit of meadow; Fit for the browsing of goats; too steep for the grazing of horses. None of the islands admit of tending, nor have they good pasture, As grazing as lie in the sea, Ithaka being first for its peacocks. This was the way he spoke; unmoved was loud-voiced Menelaos, Gave him a slap with his hand, and bluntness took up the discourse. (Od. IV., 600-610.)

Horses were always driven to the battle-field harnessed to the car; but that the ancient Greeks were familiar with feats of horsemanship that would excite wonder in our day appears evident from a comparison by which the poet tells how Ajax strode over the decks of the ships when he would urge the Greeks to battle:

But as for Ajax high-souled, not yet it suited his temper There to remain where the rest stood off—the sons of Achæans. Over the decks of the ships he strode and bunched his footstep: Sprung in his hands a spear that was long and fit for the sea-fight, Jointed with rings driven on—its length was twenty-two cubits. But as a man who well knows how to ride several horses, When from a numerous drove four horses he has selected Out from the pasture, he takes these steeds and drives to the city Over the public highway, and many, admiring, watch him, Men and matrons as well; not losing his balance, the rider, Springing he changes from one to another, while they are dying: So do Ajax upon the numerous decks of the swift ships Stride with a lordly step, and his voice rose up to the ether. (II. XV., 673-685.)

ISAAC BARRETT CHOATE.

DEATH OF S. H. TURRILL.—Mr. S. H. Turrill, Chicago, Ill., died at his home in that city, Wednesday morning, March 14. Mr. Turrill was widely known among the sportsmen of the country. Mr. Turrill was at one time a stockholder in the ROD AND GUN before the consolidation of that journal with the FOREST AND STREAM. He was for many years prominent as a trap shot, and took great interest in the Illinois Sportsmen's Association.

## The Sportsman Tourist.

## SKETCHES OF LABRADOR LIFE.

BY J. U. GREGORY, OF QUEBEC.

DURING the month of July, 1872, my official duties required me to visit the coast of Labrador below Point de Meuse.

The steamer *Druid*, upon which I made the journey safely, reached the snug little harbor near Egg Island and lay at anchor while workmen, taken down for the purpose, repaired the lighthouse and other buildings belonging to the station there.

Finding that the necessary work would detain us for two or three days, I organized a party to visit a small river some six miles off said to contain salmon. We started in the steamer's boat with the captain and four men, well provided with rods, flies, a tent, and provisions for a couple of days' camping.

On our way we kept near the shore, where we encountered quite a number of seals basking upon the rocks laid bare by the low condition of the tide. They would glide off their resting places at our approach and then come to the surface of the water, staring at us and often affording a fair rifle shot. We fired at them, but could not obtain possession of any, owing to their sinking as soon as hit. Next day, however, a resident fisherman passing picked up three which he found lying dead in the shallow water when the tide was at its lowest.

Near the mouth of the Little Trinity River, our destination, we found a fisherman's hut at the edge of the woods, with about an acre of cleared land in which was growing a patch of potatoes, a great luxury to the owner. We landed on the beach opposite the hut, and were met by a tall, powerfully built man, who bid us welcome in the language of his native country—French. We inquired about our chances of getting salmon, and were assured that about seven miles up the stream, at the foot of the rapids, we would find them. We went on this morning, and Mr. Gityon, to act as guide, and were soon en route for the fishing grounds. A tedious walk through a tangled foot-path brought us to the pool, where we toiled for two hours trying to get a "rise." We caught several fine trout, but salmon did not then show themselves, notwithstanding our changing flies, and employing all the art we were possessed of to make them do so. We therefore decided to return at once to our boat and row back to the river, but just as we had turned our faces toward the homeward path, each one shouldering his load of the supplies, we heard a splash, and a fine salmon disappeared under the water. This consoled our guide, who until then looked crestfallen at our want of success and apparent disbelief in his report that salmon would be found in the river. Feeling convinced, however, that the fish, although there, would take the bait, we had recourse to our faces toward the boat which we reached tired and hungry after our fourteen miles' walk. Fortunately we had hauled our boat well up on the shore, for a stiff breeze had sprung up, and the waves were rolling on the beach with such force as to render it impossible to launch her; we were therefore compelled to remain overnight, and accept the shelter of our guide's one-room dwelling, of which his wife and himself were the only other occupants, as they had no children.

Mrs. Gityon soon prepared a good meal out of our own supplies, and when this had been partaken of, pipes were dilled, and the men began to relate adventures of different kinds to while away the time. Our hostess not taking any part in the conversation, I looked around, and through the thick tobacco smoke could just distinguish her form sitting in a corner, and also the glow of a lighted pipe which she was quietly smoking. I asked her to come near and tell me how she enjoyed her Labrador life, at the same time placing a three-legged stool near me for her to sit upon. She complied with my request, and after some conversation I noticed that she was very intelligent, and rather well educated for a person of her position. This led me to inquire into her past life, as far as such a subject would be recalled.

She appeared to be quite communicative, and informed me that she was born in Quebec, of respectable and well-to-do parents, had been educated in a convent, and intending to become a nun, had studied with that object in view, but, owing to some illness which unfitted her for the calling, her doctor prescribed a sea voyage or residence near salt water, and she only came to the coast. Her uncle, who owned and sailed a trading schooner between Labrador and Quebec, afforded her the opportunity of making the desired sea-trip. They left Quebec late in the summer, bound for the Straits of Belle Isle, but were wrecked near Esquimaux Point, barely escaping with their lives. She was kindly treated by the inhabitants and thoroughly recovered her health. While there she met Gityon, a Frenchman and a cooper by trade, who had come to the shore with a small boat. She managed to build up a fortune making barrels for Canadian fishermen. This he did not succeed in accomplishing; but he wooed and won the would-be recluse, and they were duly married, when a life began for her such as she had never even dreamed of.

Not long after their marriage Gityon built a fishing barge and with his young wife, provisions and traps, crossed over to the Island of Anticosti, put up a small hut. She was one of the most isolated localities, and then led the life of a trapper; often leaving his wife for days and even weeks at home, her only companion being a large Newfoundland dog—not a neighbor within twenty miles of her. It would be difficult to imagine a more solitary, cheerless life for anyone, particularly a woman, and one whose early training was so calculated to enervate the system. Her uncle, however, was provided with a common single-barreled gun, and plenty of ammunition, and soon became an expert shot. During one winter she killed five black bears and a large number of geese and ducks. Her description of the utter solitude, her mental depression, and the vicissitudes through which she passed was most touching.

Once, during the severest winter weather, when entirely alone, the hut took fire and was burned down. She managed to save her gun, ammunition, some flour and clothing; everything else was destroyed. She made for herself a suit of men's clothing, with old boat sails, which she lined with her own warm female apparel, and thus she passed six weeks in a cabin made by her own hands from the trunks of trees which she cut near by, stuffing up the interstices with moss to keep out the bitter cold. Upon her husband's return they set to work and erected a new hut.

The following summer, her husband being away on the

other side of the island, she was again alone for several days. One fine calm day, an American fishing schooner, which had remained almost stationary for several hours opposite the hut, cast anchor, and made preparations to land part of the crew, with the evident intention of visiting the house. She, fearing that her unprotected state would expose her to insult and danger, hastily caught up a pair of scissors, cut her hair short to make it resemble that of a man, slipped on some of her husband's old fishing clothes, besmeared her face so as to give it the appearance of being covered with a young growing beard, and quietly awaited the arrival of the visitors who soon made their appearance, carrying with them a jar of whiskey, cards and provisions. Not being able to speak English, by signs she made them welcome, and all that afternoon until next night she was forced to drink, play cards, smoke, and take part in a perfect orgy with the unruly set. However, she acquitted herself so well as to excite no suspicion in the minds of the rough seamen, and parted with them the best of friends, but feeling thankful to have got rid of such unwelcome guests. For many years she spent such a life on Anticosti as few women have ever experienced anywhere.

At last Gityny decided to come over and live on the north shore, where I met her. She often begged her husband to come to Quebec, but he refused to do so. Once she managed to get away from home while he was absent, with the intention of sending him word to follow her on her arrival at Quebec, this being the only plan she could conceive of inducing him to leave such a desolate place, but he, reaching home earlier than she expected, followed her footsteps in the sand on the beach, and overtook her on the road to a locality where she hoped to find a schooner to bring her back to the civilization she longed for.

My presence appeared to give her new courage, and I strongly urged her husband to come up, promising to procure work for him. The next summer he did so and soon found employment at his trade, but after a few months' residence in town Mrs. Gityny's health broke down again, and I was surprised to learn that they had returned to Labrador once more.

A year afterward a woman dressed in black was shown into my office, and I again beheld Mrs. Gityny, this time a widow. She told me that upon their return to Labrador they had gone far back into the wilderness with the necessary supplies to spend the winter trapping. They had two dogs and a "commette," or sled to assist them in carrying their outfit; but they had hardly reached their destination when her husband was stricken with paralysis and died in her arms. Fancy her dreadful position! A hundred miles away from any habitation, the body of her dead husband lying on the ice, and her only means of support being the sled up all her courage she strapped the lifeless form on the sled and traveled the long, lonely journey back to a neighboring fisherman's, when she buried her husband and came up to Quebec, intending never to return to Labrador again.

Recently, however, I was astonished to learn that, although now past forty years of age, she has married another fisherman, and made it possible for him to that desolate coast, to resume the life that she once so dreaded, but she now evidently prefers to any other.

Some persons eventually become so fascinated with the wild, free life of a trapper or fisherman, that, notwithstanding its hardships and vicissitudes, starvation often staring them in the face, a few months' residence in a large city becomes so irksome to them that they long to return to their former occupation, and eventually do so.

I have known a well educated, born and brought up near Quebec, formerly a storekeeper, married to an educated woman, who accepted a situation as lighthouse keeper on the island of Anticosti, and afterward obtained, through family influence, a good government appointment with sufficient remuneration to enable him to bring up his family well and live comfortably, actually shed tears when he left his isolated island home, and a year afterward trying to get back to his former position. I have also known others to get out of their minds from the dreariness and monotony of their lives. These were invariably men. Women appear to bear up better, and frequently do the most of the work, keeping the station in order, while their husbands look the picture of unhappiness. Again, there are some stations, where husband, wife and children seem to be perfectly contented, the family well educated and even accomplished in music and other refinements. The station is well supplied with literature, and their conversation is free from slang so often noticeable in town-bred people.

Professor Linden, in his interesting and truthfully written papers published in your last volume, mentions one of such families, that of Mr. Edwin Pope, of Anticosti, whose amiable daughters, who have never till last year left the island, would do credit to any city family. His sons are well educated, and all but one appear to advantage anywhere, and Mrs. Pope was born and brought up on the island, and to the best of my knowledge has never left it.

There are others in my district on the coast of Labrador who are possessed of considerable education and even refinement.

At the solitary Bird Rock Station, where the lighthouse is perched on a square rock a few hundred feet in extent, where one can reach only by being hauled up in a box by means of a crane 120 feet from the water, the keepers have been sadly tried. The first keeper there, after two years' residence, became insane from the monotony of the life. He was replaced by a very respectable man who, after having filled the situation for nine years, was one day tempted to leave his station to hunt seals on the surrounding ice, but was overtaken by a storm and perished with his son, their bodies never being recovered. His successor, one of the most able and intelligent of our keepers, while firing the fog-bell, by some means ignited a barrel of gunpowder at hand, and with his young son and assistant was blown to atoms; yet notwithstanding these fatalities, no sooner does a vacancy occur than applications for it pour in, invariably from those possessed of all the necessary qualifications to earn a living elsewhere.

Two years ago I visited the coast in the steamer Druid, together with His Excellency the Governor-General and his suite. We stopped at many of the most interesting localities, among others Seven Islands, and anchored in the beautiful bay of that name. His Excellency and myself, taking guns, embarked in a canoe paddled by two men, hoping for a shot at something. We had been informed elsewhere that porcupines were plentiful, and were eager to shoot them. When nearing the shore we were hailed by a Canadian fisherman, who, coming up to us, and, having landed, I asked him if there was anything in the neighborhood worth shooting. He answered, "Yes, if you know what you want. As we did not know which direction to take we requested

him to procure us a guide, whereupon he said he knew a young Indian, an excellent sportsman, who, he thought, would answer our purpose. His Excellency whispered to me to try and get a full-blooded Indian, no sham, for some of those he had employed on similar occasions elsewhere bore Scotch names, such as McLeod, etc., and resembled too much the white man; he would like to see the real Indian, and expected to find him in such a good place as this. I told the fisherman to bring us a real Indian, and he said he would do so. Fancy our surprise when he brought a distance toward an encampment of some twenty wigwags, on hearing him shout at the top of his voice to a perfect looking Indian, whom he called by the name of McKintzie—Scotch again! However, since then His Excellency has not the "Simon pure" in the far West, without a Scotch name, and doubtless enjoyed the novelty.

## NIMROD IN THE NORTH.

BY LIEUT. FREDK SCHWATKA, U. S. ARMY.

### V.—Nimrod with a Fish-rod.

TO the devotees ofzaak Walton, the sly old trout fishing himself with his line in the deep shadow of the overhanging willow or low brush, on a hot summer's day, winking and blinking at the feathered hook with a sort of I've-been-there-before expression; the grayling with his voracious endeavors to swallow hook, line, pole and fisherman; the bass, the pike, the pickerel and all the gamy gladiators of the genial climes are wanting in the frigid zones; yet there is some grand old sport, excitement spiced with danger—that sauce of man's noblest essays—in many of the fisheries of the frigid zones, from the huge whale cleaving the clipper-built boat of his pursuers into fragments with one stroke of his huge tail, to the tiniest little finny fellow that scratches his head on the under surface of the treacherous ice.

Ever since Captains Edge and Poole on the 12th of June, 1611, struck and captured the first whale, and the amphibious sailors of the Dutch, English and Scotch have developed this rude sport. It has been a wonder that so many sportsmen in search of gladiatorial games—games that could give as well as receive defeat—have never crossed waters with these tigers of the sea. Perhaps their pursuit proves to profit and loss; but so does the buffalo in the hands of hirelings. Perhaps his haunts are too remote to be invaded cheaply, but whoever heard the true sportsman stand on such ground when we consider the great expense of excursions to such lands as Africa and elsewhere to kill the lion, tiger or leopard? However may be the reason, the noblest "game" given to man is left to the hands of those who kill him for the coin he will bring in the markets. I can imagine nothing more exciting than a good whale chase, and I think it would send any sportsman's blood up to (buck) fever heat. I had been promised a royal old chance to participate in such a chase by the mate of the Eothien, the whaler that bore us to Hudson's Bay, should they ever "leave" for one before my little party was set ashore to prosecute its Arctic explorations, but no such chance ever came, although no one probably watched the mate in the crow's nest at the masthead for "there he blows" more than I, not even those to whom their pocket was more than their pride.

The Esquimaux catch considerable numbers of whale and trade their bone and oil to the whaling ships, and this fact creates considerable rivalry between the different vessels to reach the whaling grounds first in order to barter with these native fishermen, who have been plying their trade for a month before the ships can get in. The ancient Esquimaux, or purely native method of killing a whale was to pursue him with the harpoons and bladders we have described in the walrus and seal hunt, by a large number of natives in their *kiksks* or skin canoes and literally fill him so full of them that when exhausted after a long chase he was unable to sink beneath the ice and fell prey to their sharp lances. A mode of wood tipped with walrus ivory heads. Many of the old Iwlikik Esquimaux told me of their ancient whale hunts, the flesh of these monsters keeping a fair sized village in dog meat for the winter while the skin about an inch thick was used by them—elves; the whalebone cut into strips was used to lash their *kiksks* frames together, while the bone proper from the jaw was sawn into long batten-like strips twelve or fifteen feet long, three or four inches wide and an inch thick, with which the slender whaler was given them a broad running and bearing surface. This with the oil and blubber for light and food made the whale one of the most useful game they could pursue.

Now they hunt them like the whalers, oftentimes in boats supplied by them or obtained from wrecked whaling ships, and sell the proceeds for almost insignificant results, the fruitful results of the contact of civilization with savagery. The Esquimaux also form, wherever they can, for anywhere can be found more hardy harpooners, braver beatmen, than these natural fishermen in their seas of ice and storms.

The skin of the whale is considered the best part for eating. It is "as black as the ace of spades," and when boiled in the trying pots its taste is not unlike that of tripe. It is an excellent article of diet, in that it assists to keep away that bane of the sailor, the scurvy. Before their contact with white men they would die "in" out of the whale blubber in such a wholesale manner as now does for their benefit, as they believed, and probably with some truth, that the smell of the rendered oil would drive away the reinder and musk-oxen, especially if there be an insular wind. Game once frightened away in this manner is very slow to return.

If the natives are "whaling" from a station on the coast, the *ang-ah-ah* or medicine men on the shore, assisted by those who have remained behind, beseech their god of the seas to give the whalermen luck by their coifforous *ang-ah-ah* in the system of dynastic devotion more fatiguing than the chase of the whale.

One use of the whalebone to which the natives put it, and one case of which came under my personal observation, I must not allow to pass unnoticed. Whenever wolves have been unusually predatory, have destroyed a favorite dog or so, or have dug up a *cache* of reinder meat just when it was needed, or in any way have aroused the ire of the whaler hunter, he takes a strip of whalebone about the size of those used in corsets, wraps it up into a compact helical mass like a watch spring, having previously sharpened both ends, then ties it together with reinder sinew, and plasters it with a compound of blood and grease, which is allowed to freeze and forms a binding cement sufficiently strong to cut the sinew string at every second or third turn. This, with a lot of similar looking bands of meat and blubber, is scattered

over the snow or ground, and the hungry wolf devours it along with the others, and when it is thawed out by the warmth of his stomach, it elongates and has the well-known effect of whalebone on the system, but having the military advantage of interior lines its effects are more rapid, killing the poor wolf, with the most horrible agonies, in a couple of days.

The narval, narwal or marwal, or, as it is sometimes called, the sea unicorn, gives the natives of the North much sport in its capture, which, in general, is by the old stereotyped method of inflated bladder and harpoon, a method which has never been improved upon, even by the ingenious Yankee whalermen, for their whaleboat is nothing more than the float, and their harpoon looks wonderfully as if it had been borrowed from that of the Esquimaux, with civilized workmanship in its detail. The natives in Hudson's Strait brought me some to barter, but I have never been able to see any in the bay, and in fact the Esquimaux there know of no such fish at all. Its peculiar twisted ivory tusk of from about five to eight feet in length, is its weapon of defense, and it is not altogether a bad one if it can be once gotten through the frail covering of the native skin canoe, but accidents from it are rare; in fact the pursuit of the narwal is not a common sport even in waters where it is the most numerous. The flesh of the narwal is considered very fine by the Esquimaux, and as they are from fifteen to twenty feet in length, exclusive of the horn, it is not so singular that they are not pursued more when they obtain so much meat in one animal. Probably the tusk or rather its active use mostly influences their practical minds. The fish themselves use it to transfix fish which they pursue, to break the thin ice so they may breathe and blow, and as a weapon of defense. It has been known to bury it in the wood of ships, into the sides of whales, and even run it through the copper of ships; in truth it is the hardest ivory known, being worth double that of the best elephant ivory.

As we were entering the eastern entrance of Hudson's Strait we managed to while away a few hours pleasantly from time to time in shooting with our revolvers at the grampus whales that came sporting alongside of our ship, with a familiarity that seemed to take us to be one of their kind. It is needless to remark that we "bagged" none, for a pistol shot would have to more effect on their black, scaly backs that protruded from the water than upon a Creedmoor butt; in fact they really seemed to enjoy it, as their sportings became greater and their familiarity stronger in direct ratio to the amount of firing we would do at them, a sort of satire on our shooting. It is probably their penchant for seal meat that attracts them into the sub-Arctic regions, some of the sailors believing that they dislodge them with their tail or back fin from their frail abode on the edge of the ice or rocks, when they come out to back in the sun. When the Arctic sky is deeply overcast and the water of the sea by sympathy have taken on the same garb with the blackest lung swells, there is nothing more beautiful than a school of white whales passing by, their ivory white skins contrasting conspicuously with the dark green fluid in which they swim; or when the sun is shining brightly their backs, as they roll gracefully along, shine like so many mirrors so bright as to give their pursuers a headache.

It has been seen in Hudson's Bay early in the spring (traveling along the coast as soon as the shore ice breaks up, generally toward the east at Depot Island, and then again become numerous in the fall just before the new ice forms, traveling in the opposite direction. The natives are eager in their pursuit, as it gives them some variety from the summer walrus hunt, and nearly as much blubber and meat. One thing I could not help noticing in their movements, while they were occupied in their sport, and I then as they passed, and that was the almost simultaneous manner in which the whole school, however widely dispersed, would appear at the surface. It almost seemed as if they were figures joined by immovable rods and raised and lowered by machinery. Even when the island split them apart this synchronism was still observed, and on one occasion this happened when there were but two which were thus separated. These well-remembered incidents were viewed to be in their highest state of discipline in their fat maneuvers, when they appear to have more leisure; their spring actions being more the method of a mob scurrying along in a hurry to their feeding grounds. The porpoise is sometime seen and caught in the Arctic, but it is, in general, a very scarce game, not to be depended upon. I know that in a strict scientific sense all of the above are mammals, and therefore not strictly speaking fish, but are introduced, and their catch described in their most common names. They are really no more fishes than the seals and walruses already described.

Those old piscatorial pirates, the sharks, often invade the Arctic, no doubt tempted by the carcasses of the whales or seals and walruses left to rot by white men engaged in their pursuit. Natives angling from their skin canoes in deep water occasionally catch a sluggish shark who has engulged the bait, but there is no use pulling against such a mountain of flesh and relying upon their strength to bring him up; and this the Inuit, Izaak Walton fully knows, and overcomes his strength by sagacity. At every brisk pull by Mr. Shark, showing him to be irritated, the line is lowered to appease him, but cautiously hauled in again almost immediately, the shark slowly rising to this strategic manipulation, until "like a finny fool" he rests upon the surface of the water, well exhausted by his exertions. The weakest fishing-line, when with a long knite the fisherman extends and disengages him by a well directed thrust through the spinal cord. From their well-known voracity in warmer climes it seems singular indeed that they do not often attack the native fishermen in their little skin canoes, but there is not a recorded or known instance of such attacks even on the west shore of Greenland, where they are most numerous and the shores are visited by large numbers of them—from ten to twenty thousand a year, according to Dr. Riik, Danish inspector of this coast for a long number of years. The most useful method of catching these fish can hardly be said to be fishing at all. Near a hole in the ice a lighted torch is placed, and two natives stand on opposite sides of the hole with two sharp hand-hooks, like deck bands of a steamer at the end of a shute waiting for merchandise, until the shark sticks his nose out, when he is treated in about the same business-like manner as the Inuit. There are some shark carcasses often accumulated by hundreds, as this shark fishery when once commenced is generally carried on through the whole winter. The cartilaginous bones are the favorite parts for food, as the raw frozen flesh seems to have a depressing effect when long continued, and to it is attributed the dog disease of the North when fed to them, and which every few years carries off so many of these useful animals.

can't prove it by me. He was headed to the northwest, and I have always believed that he went straight to the Bad Lands, which was bad enough sure. But the serpent didn't go—not a bit of it. There is no record that he was driven out, and I have conclusive evidence that he stayed in this place a long time, boys, that serpent was a massauger! He stayed and multiplied and multiplied and multiplied.

"Massauger! What's that, Major?" shouted a little nrchin on the outer circle of the crowd with his shoe-brush and blacking-box slung over his shoulder, as he adjusted his tattered straw hat.

"There, now," shouted the Major. "What is this world a-coming to that a boy born and bred right here should ask what a massauger is! Where is the schoolmaster now, that says, 'I don't know'! What prevail in the rising generation? Yes, it is one who is growing up to make a voter, may I decide a Presidential election, it may be, and I dare say, my mamma thinks he will be President himself—most mamma thinks so in this country. But you tell her for me, sonny, that such ignorance looks bad for her hop-fol. Massauger! That is the little black prairie rattlesnake. He is the meanest little cuss that ever walked the earth. I just knowed it was the reason that presented that apple to Eve. The evidence is abundant. He is found in the most places. He is just mean enough to do it, and then he is just the size. When the record is silent we must look to probabilities. Now, if it had been a big snake it would have scared away the timid maiden, and he could never have accomplished her ruin. No, it was a little serpent that she was not afraid of that offered her the apple."

"Now, Major, a moment," howled Tom Slack, "and tell us how such a little snake could have held such a big apple in its mouth?"

"There it is again," cried the Major, "another presidential candidate going under very fast. Don't you know that a snake's mouth is a great deal bigger than he is himself? Don't you know that a snake can just unbinge his jaws when he pleases and open his mouth as wide as a quoncho if he can make anything by it; and you just bet that little fellow did his very best to handle a big apple, and I have no doubt it was a real feat at that."

"Mean, did I say, yes, indeed. Would you believe it, in the nesting season of the prairie chicken, they prow around and find all the nests and eggs, which they gulp down as if they were sugar-coated. One will swallow a whole nest full, till he is bloated out like a bologna sausage. But this is not all. If a nest escapes them they are always on the lookout for the little chicks, which they seem to like even better than the eggs, and I honestly believe they are mean enough and smart enough to do it. The nests, that they may thus profit by the patient industry of the old hen. On some prairies I have seen them so thick that not a prairie chicken could be raised there, and how they supported themselves I don't know, unless they eat each other, which I am sure they did, for they are just mean enough to be cannibals. Why, if I were to tell you of some of my experiences with the massauger, you would actually think me exaggerating, and I should lose your confidence in my veracity which I prize so highly."

"No! No!" they all cried. "Tell us about it, we know we can depend on every word you say."

"Well then," said the Major, as he smoothed down his long white beard and changed the position of his legs by swinging the right over the left, "I will venture this once to tell you how it was. When surveying in the prairie in winter, by these cold, I always wear heavy boots and a buckskin suit throughout."

"I was once running a line across a large prairie when I came up to the flagman on the top of a swell in the prairie, which overlooked a valley about a mile wide, and in the middle of the valley was a wide swale where the grass was very high. I told the flagman to go quite across the valley. I set the compass and sighted across, when I observed in the exact line a clump of the compass plant in full bloom, which stood a little by itself, though many others like it were near by on all sides. I thought if I could keep my eye fixed on the object till I could reach it, I could save some time, and I determined to try it. The compass under one arm and the tripod under the other made a pretty good load, but I was young and strong, and I fixed my eye on the object a mile away and started. The first half of the distance I got over very well, but after that I began to grow weary, and before I reached the object from which I ever once removed my eyes, it seemed almost impossible to drag one foot after the other, and I felt as if I must stop and rest. I however persevered to the end. So soon as I reached the object I looked down and saw that more than fifty of those cursed massaugers were fastened to my buckskin leggings. The pisen pests had been striking at me all the way across, whenever I came near one, and from the peculiar texture of buckskin, whenever one struck his teeth into it he could not let go, especially in a sudden motion. Well, boys, they just covered both legs nearly to the knees and they made it lively down there, I tell you. My legs then would have made a good match for the Medusa's head. To draw my hunting-knife was the work of an instant, and I struck off heads faster than you could count. That was the biggest massauger funeral I ever attended, and the ceremonies were the shortest."

"But massauger is not without its uses, and proves the truth of the saying that nothing is made in vain. The early settlers, before they had time to raise a crop of corn, used to fatten their hogs on massaugers, finishing off with acorns in the groves. Now the hog is an omnivorous animal, and—"

"Hello, Major, what is omnivorous? What breed of hogs is that?" cried a little nrchin, whose pants were rolled up to the knees and who was leaning over, listening as a suspender over the left shoulder and whose mamma had been paid time to repair his breeches torn on a picket fence, which he had climbed the day before to plunder a neighbor's garden.

The Major stroked his long beard as he looked at the inquirer with a benevolent rather than offended expression, and said:

"Come here, sonny, till I tell you. Here is another case where a candidate is likely to be elected by means of ignorance. What did your mamma design you for? Not the General of the Army, I am sure. You will make a man of peace, for I see you always carry a white flag. But let me advise you hereafter to carry it in front of you rather than behind, that your flag of truce may be seen before you are injured. Omnivorous, did you ask? You are an omnivorous yourself, and eat everything you can lay your hands on, and that is the way you get fat. You are not always over scrupulous how you get them. All creatures are divided into three classes—carnivorous, omnivorous and

herbivorous. Will you remember that, sonny? The carnivorous eat only the highest organized kind of food, namely flesh, and would starve to death in the midst of all the vegetable food in the world. Of this class is the massauger and the tiger, for instance. The omnivorous are those who eat anything that comes along, whether flesh, fish or vegetable food. You are of this class, as I said before, and so is the hog as well as the bear, the coon and the possum, for example. This class can live anywhere where anything can be got to eat, and so may be called lucky."

"The herbivorous is a class of animals that live on vegetable food alone, of which there is a much greater abundance than of animal food. Of this class the elephant, the camel and the horse and the rabbit are examples, so you see that these vegetarians embrace the largest of all our animals. Now you know what omnivorous means, there may be some hope for you."

"But why didn't the serpents bite the hogs?" inquired a bright-eyed, round-faced lad, who stood with gaping mouth listening to the Major's lecture on zoology.

"There, now," said the Major, "what a question for a boy born and bred in a prairie country. The hog is the only animal I know of that the rattlesnake can't hurt, and what's more I don't know of anything that would poison him. I once tried a pesky mean one with arsenic and he grew fat on it, and I reckon it was because they are so contrary. Why, he just goes for them like a terrier among a lot of rats in a pit. A hog will smell a rattlesnake as far as a pointer will a prairie chicken, and will go for him twice as fast, and the more there are of them the faster he goes. I once saw an old sow who had winned a big lot of these varmints run up wind so fast that it fairly took all of the kinks out of her tail, and when she broke in upon the silence of the meeting as they were basking in the sun on an old muskrat house, she dashed away right and left in a most astonishing way. One nip and one shake was enough for one, when she would drop it and go for another, and before you could say Jack Robinson, the ground was covered with the slaughtered reptiles, when she roared over the old muskrat house, where she found a few more. She then plied them all up heads and points, and went off with her litter of pigs that had come trailing and squalling after her. They had a choice family dinner that day, I tell you."

"Without that supply of hog fodder many an early settler would have run short of meat."

"What kind of bacon did those hogs make? you ask. I tell you it was first-rate. A little strong, it may be, but we had strong men in those days, and they needed strong meat. It's more than thirty years since I have tasted a bit of it—more's the pity."

"Massaugers hate civilization as much as civilization hates them; so soon as white men began to come in they began to leave, and I don't believe there has been one this side of the Mississippi River in the last twenty years. That is why I say if they hadn't cleared out Adam the first time they tried, they would all have left themselves, long before Cain was grown up so he could strike a hard lick."

"But was Adam a white man?" asked a strapping lad near the outside of the circle.

"There, now," said the Major, a little tartly. "There is another promising piece of timber spoiled for some great place. No amount of teaching can ever get him out of a log cabin or raise him above the plane of a rail-splitter, a tanner, or a canal driver. But never mind, for there are enough left to keep trying, and it may be some of them will grow up to be the schoolmaster. Was Adam a white man? To be sure he was. Wasn't Ham the first nigger? I say again, where is the schoolmaster, to let such nonsense find a place among the rising generation? What kind of rulers will he make of you?"

"You ask again what breed of hogs those were? I tell you they were the plowshare breed, or the 'prairie rooters,' as some called them. They had snouts as long as a tapir, and as stout as a crowbar, and the way they went for the wild artichokes was a caution. They would break up a ten acre piece quicker than you could with six yoke of oxen, and twice as well. And many a settler who was short of a team depended on them to break his land. But then they were always troublesome, for they would come back for the crop after it was raised. Fence them out! As well fence out the prairie chickens or the spotted gophers. I have seen one clear a ten rail fence without touching a hoof, and I once saw an old sow with a litter of pigs at her heels slip through a space in a paling fence not six inches wide, as slick as if both sides were greased, and the way she went into those flowerbeds was a caution. But a circus soon followed—the old woman and the stalwart girls rushed out of the cabin with shovel and tongs, mop and broom, and set up a yell that would have drowned Gabriel's horn, and you might have seen that old sow scoot back quicker than she came, and all you could see after that was a blue streak leading away to the prairie, and the pigs squealing along after. That was a remarkable instance, I admit, for a hog is the contrariest animal ever civilized by man, and if you want to get him out of a lot the surest plan is to try to keep him in."

"But," said Jack Tubbs, "didn't those hogs sometimes run off and the settlers lose them?"

"There now," said the Major, "there is some sense in that question, and the answer is not long in coming. It only licks him often enough."

"Yes, a good many of those hogs did run off and set up housekeeping on their own account. The hog is a strange animal after all. He is a direct descendant of the wild boar of Europe, which your story books tell you is so fierce and ugly. But he is easily domesticated, and in a few generations, if he is kept close, treated kindly and well fed, especially the latter, becomes the quietest porker you see at the country fair. But then he goes wild still easier. Turn out the fattest hog into the range and make him shift for himself and in a few years he becomes as wild as his grandfather was a thousand years ago. He gaunts up, becomes bow-backed and long-legged, and will run like a deer and will fight like a tiger, and even his children will become striped like the pigs of the wild state. This is what they call reverting to the wild state, and this he seems rather fond of doing."

"Yes, forty or fifty years ago there were a good many gangs of wild hogs in the great prairies of Illinois. They kept clear away from the timber if there were any settlements there, and took to the most secluded places they could find many miles away. Those plowshare brutes didn't want much change to make them wild, either. Once I was surveying on the Grand Prairie, not a hundred miles from here, and came across a lot of these wild hogs. An old bear challenged us at once, and I loaded up my gun and directly that I had lost no hogs in that neighborhood, and left. The flag-

man, who stumbled on them first, ran as he never ran before nor since, hotly pursued by the boar, who was clamping his teeth and frothing at the mouth, and pitched right in among us, as if he thought he was Samson, and wielded the jaw-bone of an ass, and only a ride bullet changed it from a man funeral to a hog funeral. We went a long way around the settlement, and I calculated the distance without chaining it. I tell you I would turn out a prairie wolf pack against the best in the old country and would ask no odds, either."

"But, boys, I only told you about half of that snake story. When the pesky massaugers handicapped me so, when crossing that valley, you know both hands were full, and I couldn't take my eyes off the bunch of pilot plant. When about half way across, a flock of gallinippers lit on me, like a cloud of pigeons on a grain field. They could not make much headway through the buckskin shoes or the buckskin clothes, though they did some; but the face was naked, and they soon found it out and fought for the chance. That fighting alone saved me, and not much, either, for when I got through and planted my foot at the object, my face was covered as thick with them as a squash patch. I laid down my tools and brushed them off by the handful. Before I could see to cut off those snakes' heads I told you about, a thousand of them, at least, had got their snouts in so far that they tore away when the owners went to grass, and it took one of the chain men an hour at least to pull them out with tweezers. He was a prudent and considerate youth, and when I saw him carefully laying them down on an old letter which he took from his pocket, heads and points alternately, and asked him what he saved them for, he said that Jane (she was his sweetheart and had written that letter) had told him she was nearly out of pins, and had asked him if he could, across any field, get a hundred or so, from the center of the cluster of leaves, on the top of which a burr grows, which contains seeds which will germinate and bear seeds again the third year and the two succeeding years, and then it dies. Near the top of this seed stalk a number of branches are thrown off, upon each of which a small seed burr is grown, but their seeds are generally blasted."

"Besides, such an affair for mosquito bites used to carry a piece of this root in their pocket, and when they reached the end of it a little and hold it on the bite for a short time, when the irritation almost instantly disappeared."

"Whether the sap of the leaves or the stalk is an antidote for poisonous bites I do not know, but the root certainly possesses properties worth examining by the doctors, and this is true of many other plants of the prairie which were used by the early settlers for medicinal purposes. One I had tried myself, which grows in a grassy field, and in place of quinine, and with similar effect to cure the fever. It grew up in a single stem from the root and bore a number of small white flowers with short, small leaves. The leaf of the plant grew out from the stem two and a half inches long and one and a half inches broad, and was very bitter [*Verbena stricta*].—Ed.] Of these leaves a strong tea was made, which was drunk freely, and produced a sensation almost intolerable. The tea was sometimes boiled down and made into pills, one of which is as big as a small pea, was as much as I cared to take at once."

"By the time Jim had finished collecting hairpins, I had the big head badly. But the poultice was ready, and applied all over the face. Almost instantly the burning pain ceased, and in an hour I was as well as ever."

"But what are gallinippers, Major?" cried out one of the boys who seemed to have an inquiring mind.

"Well, now, I don't blurt out for you," said the instructor in natural history. "For they, too, were all gone with the massauger long before you were born, and it is lucky for you that they were. They are a kind of mosquito, only a good deal more so. They are most as big as grass hoppers, with speckled or barred wings and legs, and they have bills long enough for hairpins, as was shown by what Jim did for his sweetheart. They are as sharp as a two-edged needle, and as strong as a wooden comb. I in a big smoke and agreed to divide it by each one taking one swallow—honest. Each swelled his cheeks out big and it disappeared fast, but before it got round there was more than half an inch of gallinippers on it, but the last fellow didn't mind it, and said he got more good out of it than any of the rest."

"Why? a half-dozen smart gallinippers would clear that bottom of the mosquitoes and lay in half an hour. Once, when I was surveying a government contract on Lake Superior we camped on a beautiful lake—Lake Gratio. It was a charming little lake of clear sweet water. 'Now, boys,' said I, 'we will have a nice dish of trout for supper. You, Bill, get some bait, for that lake I am sure is full of the speckled jacks.' 'What shall I get,' said Bill, 'for you know there are no anglers within all this country.' 'And I knew Bill was right—not an angle worm ever existed in the Lake Superior country, till they were taken up there, and planted by white men. I myself took a pair of them up there about twenty-five years ago and planted them along Eagle River, and in a few years they were as plenty as blackberries on Indian Creek. Angle worms are migratory and follow civilization, but they won't follow the Indians, they are too refined for that."

"I told Bill to tear an old log to pieces and get some grubs, and I said they would do better than any worms, since the trout were not used to these. An old Chippewa Indian had sauntered into camp and heard what I said spoke up: 'No trout in that lake.' I was too polite to tell him that I knew he lied, for I thought no trout could keep out of such water, but after fishing the lake all over in every nook and corner for three days, I found the old savage was right. So let no one fish for trout in Lake Gratio."

"When Bill had found any grubs in the crowd of gallinippers, which he had scattered all over the place, he came like a whirlwind and settled down on us. Then such a jumping for bear's grease

mixed with gunpowder you never saw before. We smeared ourselves all over a white flint, when the laugh was on our side again. I took care out of that threat, or we immediately baited our hooks with gallinippers, and although we caught no trout we caught a fine string of yellow perch, and some black bass.

"Now, boys, I think I have told you enough for one day. If you remember it all you will do well. It is of no use for me to tell you things if you turn away and think of them no more. Right now, when I have said to you, 'I have said and see how much you can remember of what I have told you, and the oftener you think it over and try to remember more and more of it, so much the better, and if you will talk it over among yourselves and see which can remember the most, so much the better still. If you try hard you may have it all well turned into you so you will never forget it. Those who do this will have good hopes for the future, but those who turn away and forget all had better keep to shining boots, for they will never be fit for anything else."

"One important difference between great men and little men is that the former think over and ponder and try to remember what they learn, while the latter immediately forget it. It leaves no more impression on their minds than a passing shadow. Those who want to remember what they may meet with hereafter, must, as I have said, at o'clock and I will tell you more about things as they were in the western country in the olden times of long ago, if only the day is pleasant."

As the Major closed his discourse and bade the boys a good morning in a kindly tone, I slipped my note book into my pocket and looked as innocent as a lamb when he gave me a nod of recognition as he passed me.

[TO BE CONTINUED.]

## OUR WINTER BIRDS.

BY GEORGE E. EYRE.

VERY few of the many persons that are interested in birds in summer time ever think of studying their habits and habits during the winter months. Except the snowbirds and one or two others, all birds are supposed by the general public to go south at the approach of winter. And yet, if people only take the trouble to look around them a little, make an occasional tour of their park or some wood, go along some hedge or tramp through the brown fields, they would be surprised to find so many birds that were willing and able to defy the fiercest weather. The brave spirit shown by the birds that winter in our northern States and Canada excites our warmest admiration.

The snowbird (*Junco hyemalis*) is the most common of all our winter birds. Breeding in the British Provinces and the mountains and high wooded regions of the Northern States, it comes, in wonderful numbers, to pass the winter with us. They usually arrive during the first weeks of October, and tarry again for their homes in the woods about the middle of March or first of April. While here it is one of the most cheery of birds. When the snow has fallen enough to entirely cover the ground, then the snowbird is in his glory. How he swings from the tops of the brown ragweed! How he twitters! A flock of a hundred will be feeding thus, and their united voices make a harmony that it will pay us to go far to hear. In the evening, when the night threatens stormy and cold, we see them scurrying across our gardens, stopping long enough to glean a few scattered seeds, and then hurrying on to find some old barn or thick evergreen tree in which to pass the night.

In the country, when the snow has covered the ragweed and the catnip, from which they get a large part of their daily food, they fly along the rough rail fences that are everywhere to be seen, and pick the seeds out of the crevices where they have been deposited by the wind. How noticeable are these little birds. We swept away the snow and threw seeds and crumbs to a dozen snowbirds. The next morning there were more than a score of snowbirds and a few song sparrows enjoying their breakfast. In two days we had more than one hundred boards of the feathery order, all of whom came regularly, morning and evening, to pick up their food, making us and with their music a twittering. When nothing else can be had, stacks of hay and grain afford them a subsistence.

Next to the snowbird in point of numbers come the song sparrow (*Melospiza melodia*). It must have a strong love for home associations, for the patch of brambles, the grassy knoll, and the field of grass and stubble that it frequented in summer, are also its haunts during winter. Its deep, mellow chirp is heard in the same places, and it is often seen hid away under some grassy or bushy thicket; but when the sun shines clear and warm, he will even sing as a song, such as he delighted to sing last summer. When the warm days of March—fair promises of spring—come, then singing commences in earnest. Perched on the strong cane of a blackberry the song sparrow pours forth his varied songs. His bill of fire is much the same as the snowbirds, only he does not make so much ground in cold feeding, and he is usually frequent-flower and damper ground.

The fox-sparrow comes among us only when forced to do so by the severity of the weather, and the chirping sparrow remains with us so irregularly, that he is seldom seen in winter.

The goldfinches, those exquisite little songsters, resembling in color some varieties of canaries, always winter in our northern States. They are found in the fields and woods in flocks of forty or fifty, and move about the country in search of food. Sometimes they will not be seen for several weeks in a locality, and then they will come sailing around with their unmistakable undulating flight for several days. Occasionally a pair of birds, usually young, will leave the flock and take care of themselves for a day or two, and then, tiring of solitude, they seek the main body of flocks.

The soft feathered chickadees, when the snowflakes were falling fast, we heard the song of a *Chimarra tridactyla*, and upon going to clump of sumacs, saw a young male and female goldfinch. The male sat on a twig, a foot or two below the object of his affection, and sang most sweetly. Few old birds, in balmy June even, could equal this bird, on this gloomy day. We listened for half an hour, and went away wishing that we had it in a cage so that we could hear its thrilling song every day.

Bluebirds (*Sialia sialis*) and robins (*Turdus migratorius*) sometime brave winter's cold and snow, and stay in the land of the apple and pear. Rarely more than a half dozen of each species are observed in one neighborhood, and never in cities or towns. They are usually quite silent and cheerless during the time that their friends are sojourning in the Gulf countries. The robins feed on dogwood berries, buds,

green plants, and whatever of insect life can be obtained in cold weather. They are never seen near dwellings, but love solitary woods and points of hills, and are sometimes seen in hemlock or other evergreen woods. At this season he is ever silent, and seemingly sad. When seen he sits quietly away, not that he is afraid, but that he desires solitude. But in the spring, when the warm days do come, our hardy robin will be the first to triumph over fallen winter, and sing the praises of genial spring.

The bluebird has his habitation in the cavity made by a woodpecker in the usually seen in an open wood of large timber, or what in the New England or Middle States would be called a "woods field." They do not venture forth in very cold or rough weather often than every two or three days, and then they only make short excursions among the neighboring trees for the purpose of finding a few bearded flies and bugs to appease their appetites. Ah! how sad is their "Cherichy-cherichy-cherichy" as on a warm evening they fly to their hole in the dead oak, while the mercury in the thermometer is dropping to zero and the wind whistles a dirge through the leafless trees. But when the snow is melting on the eastern hill, and the ice upon the river is broken, their "Cherichy," now so sad, will be a gushing note of joy.

What a gay and dashing fellow is the blue jay, the *Quercus canadensis* omnithology. He is just as vicious and spirited in action as he is in dress. Then, too, he has the virtue of being a permanent citizen of whatever locality he deigns to honor with his presence.

The jay's mode of obtaining a livelihood in winter is, of all our hibernating birds, the most interesting. During the fall months he is ever industriously concealing chestnuts, acorns, corn and sometimes hickory nuts. Only one nut is buried in a certain place, and then they will have their winter's supply scattered over a mile or more of all sorts of rough ground. But how they find these nuts again is beyond our comprehension. And yet, we suppose, they find every buried treasure, for after having examined many hundreds of places where the jays had been scratching, we have never yet found one where a nut of some kind had not been unearthed. What a wonderful memory for locality must they have! No wonder, for they are independent, even if the snow does lie white and deep on the ground. For do not each one know just where to alight upon the smooth surface, to dig to find his dinner?

When the winter comes with too grim a visage our blue jays retreat to some hollow tree or thicket of white oak shrubs to shelter themselves from his fierce blasts. Then, too, to shorten operations, do our jays stoop to methods that are somewhat unbecoming to the noblest mammals. They will apply to the worthy granary for a breakfast of corn, and without waiting for consent, will help themselves. Perhaps they think that they have earned that much by destroying slugs and noxious insects during its cultivation. Most social bird! Come and see us, as you do, often, and fear us not. Ah, you saucy, inquisitive fellow! We wish you no harm.

The black-capped titmouse (*Parus atricapillus*) is one of our happiest winter birds. He is sung of by poets, and rightly, for no other bird shows a more brave and cheery spirit. The chickadee, as this bird is commonly known, really is not in his happiest element until winter time. Then he will swing from the peach trees that grow by our garden walls, and all the time talking so cheerily in bird language. And, we suppose, that if we could only understand bird language we really would hear him say—

"In picking the gum from the old peach tree,  
And the seed doesn't trouble me,  
Pee-dee-dee."

The country children have a beautiful habit of hanging bits of bread upon the posts or trees near their homes, for the birds to eat. The chickadees, with their near kinsfolk, the woodpeckers, will come every day to feast on the bounty so generously given. And while they are so happy, the children are more so, as from the windows or doorway they watch their protégés of the time being. This little bird is very sociable. It is usually seen in company with a half dozen of its fellows, and sometime, a couple of woodpeckers are present. It is all a lively crowd, and it is not infrequently butters. It is surprising the confidence that is shown by the titmouse. They will suffer you to approach within a few steps of them, and then will only cock their head on one side, look at you critically, and then go on about their ever busy task of searching for food.

Several varieties of woodpeckers are more or less familiar as winter residents. And wisely so, for these are the sap-eaters of winter, whom we could during the entire year in the vicinity of their nesting ground. They will make us "flying visits" at intervals of several days or weeks, according to the amount of food to be found and the sort of reception they receive. These birds are very fond of working on the locust tree, as beneath its rough bark many bugs and their larvae are found. They are not only pleasing to the eye, but are of much practical use to the horticulturist and fruit grower. The woodpecker and sapsucker both, like the bluebird, have a permanent home, even though they are rarely "in" excepting at night. Into some dead tree a hole is bored horizontally two or three inches, and then down five or six inches, and made large enough to contain the owner comfortably, lined with a nest of fine wood or grass, and it is completed.

And the most interesting of the Virginia quail (*Ortyx virginiana*) hibernates in the vicinity of their summer homes. Of the grouse, the ruffed is justly famed for his intrepid spirit and hardihood. No hills are too wild or craggy for him. No thicket is so brambly but that he will pierce it with crashing wings. Let the snow be ever so deep, and the winds ever so fierce and wild, he will only condescend to pluck the buds from our apple trees, and with his apology for a supper he will return to his cozy abode or to some hole in a dense thicket, and sleep as becomes the king of game birds. Sometime, however, a more domestic whim will seize him, and he will pick up the grains of oats and corn to be found along the roads, when he can do so without approaching too near to civilization. That he cares little for the average winter, is proved by the fact that we have frequently heard him drumming in midwinter.

We would not probably have the same of the quail. His "spirit, indeed, is willing, but the flesh is weak." He is such a happy, good fellow, that, for his sake, we wish 'twere always autumn. How proudly they strut among the brown chestnut leaves in balmy October! How swiftly courses the blood through our veins—

"When the sun's face is red,  
And the quail is piping loud  
In the blackhead where he fest."

But there comes an end to such days. Winter spreads his hoary mantle o'er field and wood, and then all this gay cheer and laughter is thrown to the winds. Now, your saucy or merry "Bob White," as the German is most correctly say, "Fear God," will be given for the plaintive "whe-e-e, w-e-e-e." Now, you no longer have the buckwheat fields to revel in; but struggling through the snow, a disheartened troop of little birds, you seek for food and shelter, and your cry of anguish is but the overflowing of your cup of bitterness. And he who will not give you an armful of brush or straw to nestle under, will not give you an armful of grain or crumbs to sustain life through the bitter night, is not worthy of the breath of life, or the protection of him who loves alike all the good and beautiful of his creation.

## BRUIN'S VARIED MOODS.

WILL a bear attack a human being? Yes, one bear will attack a strong and courageous man and another will flee from the presence of a child, though far in the woods and alone. How is this all true? There is as much difference in the courage, tempers and general dispositions of bears as there is in the human family, or the dog family, or the horse family. Who has not seen a litter of little dogs who, when raised upon the same food, and with the same varied dispositions, although of one age and under the same parents. One will meet you in the arena, one will scamper away under the bed yelping murder; a third sits down unconcerned and awaits the results and feels willing to stand his chance, and so on. Is not this true of nearly all animals?

Once I saw three cubs, all of one litter, one was tame and quick and loved to be petted, and when scratched would turn up his back like the pet pig. Another was shy, wild and cautious, but not angry, still when convenient, he would snuff a chance presented itself. The third was a demon, and was confined with a chain; he was untamable and showed no quarters, kept up a moaning howl and whine, and wanted no visitor, but would climb up and dig down, and when I tried to hit him with a stick, he would settle the question? These bears, I think, were by the same man, in the same room, and on exhibition together.

This is a bear country, and from personal observation and conversation with scores of men who have had to do with the animals, I feel justified in asserting that the foregoing is the only true theory. When a man meets a bear he is in a precarious company, and knows not what he is to encounter. Bruin's arrival is from the forest, and he may come in and sit down or stand up and look at him, or may pretend not to know he sees him, or may creep away easily for a while and then run wildly. I have lots of evidence of all these appearances without regard to age, size, time of year or sex. The mothers of all animals stand by their young and fight for them as a general rule, especially if the infant is in trouble and gives the alarm of distress by no means is broken an exception to this rule, neither is the untamable fox, and to go outside, we will add the partridge. All females will defend their young.

Some people think bears kill sheep naturally as the bee sips honey. This is not so, if it were we could not keep sheep in the border towns in Maine. Some bears learn to kill sheep the same as dogs, and some of these sheep killers arrives in a neighborhood his mark is made and sheep have to suffer. I will confine the foregoing to the State of Maine, as I am not so well posted in other places, but presume the statements will apply generally. P. E. B.

WATA, MAINE.

## EXPERIENCE WITH WATER WITCHES.

I WAS much interested in reading the several articles on water witches, as they have appeared in FOREST AND STREAM, and, judging from your remarks, I infer you are disposed to doubt the fact of finding water in the ground by the aid of a green stick or twig.

Something over fifty years ago, being a lad of some ten years old, I was on a visit at an uncle's, who desired to procure water in a certain field on his farm in Hillsdale town, Columbia county, State of New York. He called on his sister, who, it seems, was a water witch, to go out into this field and find it. If there was water, she was to be rewarded. It is surprising the confidence that is shown by the titmouse. They will suffer you to approach within a few steps of them, and then will only cock their head on one side, look at you critically, and then go on about their ever busy task of searching for food.

I did not see nor think of water witches until many years afterward. In the mean time I had married, and afterward settled in the city of Detroit, about 1844 or '45. I bought a lot at the extreme southern limit of the city; one line of my lot was the city boundary. It was adjoining an orchard. Before we moved to the location, I was told by some of the water pipes had not been laid, so the citizens of that section depended on wells. I built, and residing on my lot, and not having put down a well, depended on my neighbor for water. We had long dry spells or drouths, when most of the wells were dry. I delayed putting down a well until the next season of drouth. Then the question to be decided was, how far to locate it, the lot being about a mile and one hundred feet. It happened that one of my young sisters, aged about ten years, was visiting us. She had never heard of finding water with a forced twig. One Sunday afternoon, at the very latter end of our periodical drouth, I was talking with my wife about digging a well, when all at once there rushed into my mind the remembrance of Anna finding water in "York State" for uncle on his farm. I told my wife and sister of this, and they told me some twigs, and let my wife and sister try them, and see if they would work in their hands.

The next trouble was to get the willow forked twigs, for, as I supposed at that time, nothing but willow would work, and as there was not a willow in the city or State that I knew of, my wife proposed that I should go into the orchard and cut down some apple tree forks, twigs. With no faith in them I prepared some, and placing one each in my wife's and sister's hands, in the position as nearly as I could remember having seen it held, and holding one myself, we sallied out into the yard, and went marching around pronouncing. All at once my wife cried out excitedly, "The twig works in my hands." Walking a little further on, down went the single upper end, and, as my wife was in the operation of pulling up the stick, she stumbled down it turned, frightening her so that she screamed and

dropped her twig. I was as much surprised as they were, and at first thought they were playing a joke; they declared they were not. However, I quickly marked the spot, and to remove all doubt I blindfolded both and led them all around the yard; whenever we came to where the stream of water ran underground the twigs would point down in both their hands. At one point, on one side, and nearly at the back end of the lot, the twigs worked so strongly that one of the branches would generally twist so much that it would be broken half in two, when a fresh one would be required. In leading them toward this one central point the twigs seemed to feel the influence of the water, commencing to turn in front of them toward the underground water, on approach to the nearer, down, down, further and further, until the crock or butt pointed directly plumb at the point designated in former trials. Passing on straight ahead (now going from the water) the twig would bend back toward them, coming up to nearly a horizontal position, or, in other words, making nearly three-quarters of a circle. Keeping on straight ahead the single ends will go back, the reverse to an upright position as at the first, when the distance traveled (say two or three rods) is beyond the influence of the water. We then reversed the order of approach by walking toward the point backward. In this case the crock will commence to lean toward the person carrying it, their back at the time being toward the water. Keeping on in that way the twig keeps bending in and down, until it strikes plumb at the time they arrive over the stream. So keeping on backward, now receding from the stream, the twig will gradually come up to nearly a level in front of the person. The tendency of the twig is always to point to the water, whether approaching or receding from the stream or spring, whichever it may be. After this thorough test I had full faith to dig a well around the point indicated, and to find abundance of water. Even in times of drouth, while my neighbors' wells gave out, mine had plenty; so much so that my well furnished our family and neighbors and their domestic animals during such periods.

**FOXES OF THE EAST.**—We receive frequent inquiries from fox-hunting riders of the Eastern States giving descriptions of foxes of unusual colors which they have seen, and requesting their identification. East of the Mississippi are found but two species of fox, the common red (*Vulpes vulpes pennsylvanicus*), and the gray fox (*Vulpes cinereus*). The former is distributed over the whole country, from the Mississippi to the Atlantic coast, and from the British line south to the northern tier of the Southern States, and even further southward. The gray fox is most abundant in the South, and is less so than its larger relative, north of Virginia, Kentucky and Missouri. Of course it must be understood that there is no fixed line beyond which neither species intrudes. The ranges of the two overlap each other, and the red fox is often killed in Virginia and North Carolina, while the gray has been killed in New England and is abundant in Ohio, but is not common so far north. While the common pelage of the red fox is, as its name implies, red, it varies considerably in color, and is thus into so-called varieties, such as the cross and the black or silver gray fox. The best authorities regard these colors as examples more or less perfect of the not very unusual phenomenon of melanism. A red fox may give birth to a litter of puppies, in which there will be red cross and black individuals, and the converse of this is true. An essential difference by which the red fox, whatever his color, may be distinguished from the gray is to be found in the tails of the two species. The tail of the red fox is covered with soft fur and long hair uniformly mingled with it, while the gray fox has a concealed ridge or mane of stiff hairs without any soft fur intermixed with them. The so-called melanism is a red fox with a peculiar crisp, woolly condition of the fur. Professor Allen is inclined to attribute this peculiarity of pelage to some disease.

**SPRING NOTES.**—Stanley, Morris Co., N. J., March 14, 1883. The birds are here with the very first indication of spring. On the morning of the 12th the air resounded with the songs of robins, bluebirds, sparrows and blackbirds. As I went from my window at sunrise this morning, a kinglet in the apple tree near the house was fairly red-dressed again by the score of robins, whose bright breasts reflected the earliest rays of the sun. The snowbirds, which have been closely occupied all winter in securing food, were chasing each other joyfully on eager wing in their love making. Great flocks of blackbirds were seen passing north. One flock lit in a tall acacia tree, arraying it in fluttering funeral garb. An immense cloud of house flies was nuzzling game of our poultry. Two hens took to the water, and the next day were killed and partly eaten. This evening I saw the first woodcock, within a stone's throw of the New Providence depot of the Delaware, Lackawanna & Western Railroad, a favorite place every spring. As I sat in my carriage expectantly waiting, one lit in the muddy road but twenty feet away; I heard several others in the adjoining fields. They are a week later than last year. —GEORGE SHEPARD PAGE.

The first robin arrived February 9, the earliest on record here. Bluebirds February 27; Killdeer March 4; crows, kingfishers and meadow larks have been here all the winter. —J. OTIS FELLOWS (Hornellsville, N. Y., March 15).

**THE GREAT CAROLINA WREN IN CONNECTICUT.**—While out collecting on Friday, March 2, 1883, a warm pleasant spring-like day, in passing by an old abandoned granite quarry, I heard a bird's song quite new to me. I found the bird perched on a low bush, among a pile of rocks, singing almost incessantly. I shot it, and on examination it was found to be a great Carolina wren. It now makes a valuable addition to my collection of birds, as noted in C. H. Merriam's "Review of the Birds of Connecticut," says it doubtless occurs as a rare summer resident from the South in the Connecticut Valley. I find no record of its being taken in this State previous to mine. —C. H. NEFF (Portland, Conn., March 10, 1883).

**THOSE MIGRATORY QUAIL.**—New Market, N. H., March 12.—Editor Forest and Stream: I have read with interest two notes in FOREST AND STREAM, Feb. 22 and March 8, both from Dover, N. H., and referring to migratory quail. I think that "G. A. W." is correct in making his statement. I was in Dover the 10th of February, and while passing along Chapel street, about 200 yds. above the gas works, I saw what is now known as a migratory quail. I do not claim to be an ornithologist, but can tell a quail from a pine grosbeak. I think it probable that they were seen the 1st inst. —W.

**REDPOLE LINNETS IN CONFINEMENT.**—Seeing in FOREST AND STREAM of March 8, Mr. Cahoon's account of a linnet he has caged, reminds me to give him my experience with them. Early in February I was fortunate enough to capture a pair of the little fellows, male and female, and I have had them caged since that time. They show signs of nesting now, and I am in hopes to be able to report the fact before the end of the present month. They eat freely of all kinds of seeds, but seem to prefer canary seed to anything else. They eat sparingly of cracker, and not at all of bread crumbs. They drink a great deal of water, and are very uneasy if I do not give them a dish of fresh water every morning. I have never seen them offer to wash or bathe as canaries do, but I think they may do so in the summer time. I have not observed the habit of hanging downward from top of the cage, but my birds use the little swing hung in the cage, and will sometimes fight fierce battles for possession of it. They are very chatty and sociable, and the "guide wife" says are a deal of company. —J. E. M. (Deering, Maine, March 10, 1883).

**SPRING IN MONTANA.**—Helena, March 11, 1883.—Editor Forest and Stream: Spring has fairly opened with us yesterday the 10th. I had the pleasure of hearing for the first time this spring, the song of the bluebird, but unfortunately I was unable to see it. To-day I was more fortunate, as a pair, male and female, took possession of my bird house, seeming to make themselves perfectly at home. I would state that this is the earliest arrival noted for the past three years. Last year and the two preceding years the first arrivals were on the 20th of March. I think all of our migratory birds will arrive earlier this year than usual, as our spring has been exceptionally mild and clear. Some few mallards have been shot in the open ponds and creeks, but they are very wild, making for the river as soon as shot at. I recently had the largest sage cock brought in to me to be stuffed that I ever saw. It measured thirty-three inches. The party bringing it in stated that he saw at least fifty in one flock ten miles north of Helena. —R. W. D.

**A CAPTURED GOSHAWK.**—Charleston, Mo., March 12.—I have a goshawk which was captured one day last month under peculiar circumstances. He was observed flying round the house, each time bringing him nearer and nearer, until he suddenly dashed through a closed window, on the inside of which being a cage of canaries. The force with which he struck the window stunned him and he was secured. Is it a common occurrence for hawks to fly through windows? He has several flocks of grosbeaks wintering with us. Grouse and deer in this section, especially the latter, have become almost extinct, but owing to vigorous enforcement of our game laws are once more on the increase. We have several disciples of Izak Walton. Notwithstanding the severity of our weather the common crow has once more appeared on the field of action, and his melodious notes warn us that spring is near at hand. —BLAKE JAY.

**PLEW AGAINST THE HOUSE.**—Rockville, Conn., March 15, 1883.—An occurrence happened here to day worthy of note, being very strange. Yesterday was our first warm day, and last night the first one that ice has not made for ten weeks. This morning the janitor of the school building found a dead woodcock by the side of the building. His head was somewhat crushed, having struck the side of the brick wall. The bird was large and in very fine condition. —S. K. JR. [We have occasionally known of ruffed grouse flying against houses, as well as quail and the Virginia rail.]

**FOOD OF THE CHIPMUNK.**—Is it known to be a common thing for the chipmunk to ground squirrel, to feed on animal life? I once shot one which had just killed a small green snake, it then had two or three small sections of the snake in its cheek pouches. The chipmunk might be added to the list of "enemies of reptiles," brought forward some time ago in your columns. —C. B. H. (Attleboro, Mass., March 12, 1883). [The ground squirrel's fondness for animal food is well known.]

**LARGE WHITE OWL.**—Fort Covington, N. Y., March 8. —I have just stuffed a female white owl, shot in January, 1883, near Huntington, P. Q., which measured from tip to tip plump five feet, five inches. The spots on it are unusually dark, almost jet black, and head very large and broad. Pine grosbeaks have been abundant this winter, but are about all gone now. —GYRACON.

## Game Bag and Gun.

**GAME RESORTS.**—We are always glad to receive, for publication such notes of desirable game resorts as may be of help to the readers of FOREST AND STREAM. Will not our correspondents favor us with such advice?

## NEW YORK GAME LAW.

[Special Dispatch to Forest and Stream.]

**THE TOWNSEND BILL** came up to-day in Committee of the Whole in the Assembly. The clause prohibiting the hunting of deer in St. Lawrence county was so amended that the clause applies to the whole State. Mr. Boynton, of Essex county, attempted to have this amendment stricken out, claiming that it was unjust to New York city sportsmen. He also put in a plea for the Adirondack hotel-keepers, and said that while the city sportsmen would not undergo the fatigue of still-hunting, they would be on hand in the autumn, when the guides would drive the deer to them. Their stay in the autumn would put money into the landlords' pockets. But it was the decided sentiment of the Assembly, however, that hunting ought to be prohibited; and the amendment stood.

An attempt was made by Mr. Rogers of Seneca to have a part of Cayuga Lake exempted from the provision forbidding the catching of fish through the ice. The proposition was defeated. When the clause offering a bounty of 50 cents on hawks and owls came up there was

a debate by Messrs. Irvn, Johnson and Roosevelt. Mr. Roosevelt stoutly defended the owl as a friend of the farmer and useful because it caught mice and other rodents. He thought that a fine ought to be imposed for killing owls. The Assembly voted to protect owls and fish-hawks.

The attempt to open the month of July for woodcock shooting failed. Mr. Roosevelt contended that no true sportsman would take pleasure in shooting half-grown woodcock in mid-summer.

The bill was ordered to a third reading.

## SUMMER SHOOTING.

"And he snote them lap and thigh with a great slaughter."

**Editor Forest and Stream:**

No matter is a law passed, or in active force, than a cry for repeal comes from some quarter, and it is as true of the game laws as of any other code. There are instances where this is proven necessary, and it seems to be the case with that which legalized summer shooting.

For one I cannot understand how any humane sportsman can advocate or practice the destruction of game in mid-summer. A shooter of this sort always calls to mind the "rail of Samson on the Philistines, and although he may make no "great slaughter," he is a butcher in will if not in deed.

The killing of game (even in a sportsman-like way) out of season is sheer butchery. "Is a cruelty to animals, in that it interferes with the breeding and the rearing of the young; 'tis a thoroughly selfish and ignoble pleasure or pursuit, in that it diminishes the chance of a legitimate sportsman to secure his quota of game in the "open" season, and 'tis hardly a violation of a wise and just enactment of the "powers that be."

Now, the making of laws to protect game is, first, in the interest of the natural procreation and sustentation of the game itself, and second, for the benefit of sportsmen who have respect for "the times and the seasons."

Should summer shooting be made legal (which God forbid it ever be), what a death-dealing gauntlet would bird and beast have to run! Not only those who appreciate and enjoy the use of a gun would be "to the fore" (some of these, at any rate), but the vast army of cockneys whose rank and file go forth into the sweet country-side when the reign of the star Sirius approaches. To be sure, these shooters might not make a "great slaughter," nor have plethora bags to hear to quarters, but the peace of the game would be gone, and the peace and quiet also of wood and field. Game has been treated like the Philistines were in far too many ways and places, and the time has fully come when every sportsman should protest against this "slaughter," and rise *en masse* to protect both game and himself.

And to the making of laws—of wise and just ones—let the enforcement of the same be supplemented. Is it not contrary to law that the sale of venison is now made? It is killed, it is shipped, it is sold! These three assertions are short, but they are suggestive and cannot be denied. Who is to fault such answers? They are not, but, like many others, it does not prove satisfactory.

Where, when and what to shoot are the three W's that are most significant to legislative bodies and to protective associations.

We cannot change, without dire result, the laws of nature, and the safest guide for lawmakers to follow is these same laws, especially as regards the protection and preservation of game, and giving reasonably wise laws and proper enlightenment of the people as to their need and worth, together with an impartial execution of them, and the whole body of honorable and intelligent sportsmen will be satisfied. These laws will not include summer shooting, however! For the sake of humane principles do let us give fur, fin and feather time to be born and to be hatched; time to be nourished and reared and in proper estate, both for the hunter and for man. Let us not allow to elude the doubt, "in season and out of season," for the pleasures and privileges of moor and mere, of rod and of gun. —O. W. R.

**Editor Forest and Stream:**

In your issue of March 8 I understand you to open the columns of the FOREST AND STREAM for a free discussion of "Clericus's" claims for summer shooting. I therefore take the liberty of giving my ideas of it.

The shooting of game birds, except for the purposes of game, is a wanton act of murder. Therefore to shoot a game bird when it is not fit for game is murder. Now, is a woodcock fit for eating in July or August? I say no, and my reasons are that the young birds in July are not fully grown, have no fat about them, and are weak, immature things, while the old birds, having just raised their young, are poor and scrawny—precisely in the condition of a hen which has just hatched her chickens, and which no one would think of eating. How then can it be that a woodcock in the same condition can be good to eat? And as woodcock raise but two or three young, one is just as liable to shoot an old as young bird, neither of which is fit to eat.

In August the birds, both old and young, moult, are weak, feeble, sick and feverish, from which they do not recover and become fat and too some at the earliest till late in September. No one will attempt to claim that the condition of the fowl is fit to eat when moulting. How, then, can a woodcock be? I say it cannot, according to my taste. Green quills and feathers no doubt help to thicken broth and give it a rich dark color, and "Clericus" may consider them a most savory addition, but I do not.

"Clericus" seems to think that the poor farmers are receding too much in consideration, etc. The fact is, the farmer, who has the land, they own it, and their own profit, for the purpose of cultivation and grazing, and not simply to raise birds for "Clericus" to shoot. And they know it; they know that every time he comes on their land without leave he is a trespasser, and they know from experience the trouble and loss it is to have pot-hunters, as most of the summer shooters are, tramping over their fields, sending their dogs through their cultivated and growing crops, picking them off their fences, leaving bars down, and gates open—for the pot-hunter acts on the theory "that farmers have no rights which he is in the least degree bound to respect." What is it to the pot-hunter if the farmer's cows follow him into the corn or potatoes? What cares he if an acre of corn is ruined? Nothing. Neither does he care how many pellets of shot the farmer finds in the side of a choice cow simply because she was in range when he was out to a trap. But the trigger is in his hand, and he can blame him when, as it frequently happens, that the dam-

age the summer shooter does him in a single day is more than the value of all the birds that are on his place in a whole year. Neither does he admire a charge of shot arriving among his cows when he is milking—a circumstance that has occurred in this town.

So great has the early shooting and fence-destroying nuisance become in some sections, that the farmers, to protect their own interests, have been obliged to post their lands and punish friends and foe alike from hunting on them.

When October has closed, and the first frost has laid on his crops, and he frequently turns his stock into the fields where the crops were grown, so that he suffers but little if a fence is left down, and as the birds are then in the swamps and pastures there is but little necessity for crossing his cultivated fields. He does not then feel the animosity toward a hunter he does in the summer.

Game birds of all kinds are rapidly disappearing; and unless great care is taken to preserve them, in a few years they will be entirely gone. It is a self-evident proposition that the longer the season for shooting the more birds will be shot; and as their numbers are decreasing so fast under the open season, restricted as it is now to the short late one, how much faster will they disappear if the season be lengthened by adding the summer!

In order, therefore, to keep the present scant number of birds good, it would seem the correct policy rather to shorten than extend the length of the present open season. W.

Would it not be well for such as "Clerics" to rent a trap and buy a lot of clay pigeons for use in the vacation season? They could then get their shooting "without sacrificing the game," and my opinion is it would be much more honorable than to kill any kind of game in the close season. It is good sport, and let me say here, he or anyone else will find it about as warm as warming the hands, and the "brain workers" will find no trouble in sleeping the sleep they just after a contested shot at glass balls or clay pigeons from rotary screened traps.

APPLINGTON, WIS.

#### WILD BOAR HUNT IN SANTO DOMINGO.

THE winter of 1870-71 found me with my companion Conroy and a guide (Monway) encamped on the upper waters of the Rio Mon, at the junction of Rio Cedra in the province of Selow, Isla Santo Domingo, enjoying existence in as fine a climate as the world affords. I cannot conceive of a more pleasant or more conducive to health and longevity. As I write a level of pleasant memories of the exquisite pleasure of existence in the mild soothing atmosphere of this favored clime, all my heart with longing for enjoying once again those happy hours. The location of our camp was in the foot-hills of the main range, small savannas, deep gulches, and high hills with almost perpendicular sides. The gulches were clothed with a dense growth of tropical timber, shrubs and at the plants, with their broad, rich colored foliage, and at the foot a stream of cool crystal water. The savanna was adorned with pitch-pines, tall and straight, from four to eight rods apart, with a carpet of a variety of grasses.

At the point where we were encamped there were some wild hogs. By crossing the river we set foot on wild land, and it was some time before the hunter's bag. I had not at this time had a single word of the word, but I had only known him by the representation of Sir Walter Scott and others, but I was anxious to become more familiar with his ways. Monway and myself, accompanied by a mongrel lot of the canine species to the number of eight, one day crossed the river, following slowly a path on the ridge of a spur for half an hour, when the pack gave tongue. Monway moved off at a gallop, giving him time to follow as best I might. When I came up to him he was standing by the side of a grizzly gray bear with a monstrous head and neck running off to almost a peak behind, the whole forming a striking contrast to the plump porkers of the Western States. I informed me this was the second one he had killed, there being one other a short distance from there. After partially dressing them we each shouldered one and started for camp, where they were skinned and the bones removed. The meat lying upon the skin was decorated with sour orange juice and sufficient salt, and hung over a pole to dry.

At this present moment I am debating in my mind if the stew made from this meat would offer their delicious flavor to a gameness derived from the pig's diet of palm nuts and roots of various plants, or to our sharpened appetites and roasting surroundings. I am not sure, but I would give much for the condiment that would make my meals once again so palatable.

Weeks passed by and although we were indebted to the wild hogs for our supply of meat I had so far failed to be in at the death. I felt somewhat chagrined, for I fancied myself something of a hunter, having hunted and killed deer and bear in Canada and in different States of the Union. Time that brings all things even to me, brought me my opportunity. We had clauged camp three times, and at the present time our camp was made high up on the Rio Cedra. Cassava, rice, sugar and coffee were getting at a low ebb. 'Twas decided that carna de puorko would not satisfy all our cravings; therefore Con would keep camp, and myself and Monway would go down to the nearest ranchos for a supply of the necessities. Two days' ride over a mountain trail, and I thought of the possibilities. Monway's horse, following day we purchased a jack ox (oxen are used very much for packing in the West Indies) and provisions consisting of plantains, rice, sugar, coffee and cassava.

Monway wished to stay at home for a few days, and Thursday I started for camp, driving the ox ahead loaded with a portion of provisions purchased. The Thursday night I camped, and Friday I traveled until afternoon, when the three dogs gave tongue. They passed in front of a large hog then I had yet seen, and I was once seized with a strange desire to add him to my cargo. Tying the animals I followed the sound of the baying dogs, armed with a sharp knife, fifteen-inch blade, and a navy revolver. On coming in sight of the quarry (which had taken his stand on a level piece of ground, not entirely clear from brush and plants) I was somewhat troubled to get a fair shot without fear of maiming some one of the dogs. I was within fifty feet of his port-hole, as I stood with pistol cocked watching their play, the bear occupying a circle the periphery of which was formed by the dogs and myself. Whether his formidable tusks, the foam dripping from his jaws, his tormentors keeping up a constant barking, with an interval of the one at his stern, as he slyly approached, and giving the bear a nip, then retreating with all his power of speed, pursued by the bear, he in turn pursued by the other dogs who were

very cautious not to make too intimate an acquaintance, just giving a nip and in their turn retreating. Forward and backward, advance and retire, went the fray. I enjoyed the sport, and in one of the critical moments, when he and he advanced with a speed I did not suppose could be kind to possess. In a moment's time he had received a bullet in the back of his neck, and had torn my pistol hand with his wicked tusk. The dogs had nipped him, and before I could give a second shot, away they went with the bear in hot pursuit. Then I began to realize that a wild boar is really formidable. He ran about twelve rods, and again stood for a few rods, with his eyes all the while directed toward his ears, writing his tail, which projected far above his snout, the froth dripping from his jaws and his head-like eyes throwing forth their malicious hate. He looked the embodiment of twenty devils instead of one. I approached within four rods, taking the precaution to stand under a tree, the lower limbs of which I could reach with my hands. The knife in my left hand and pistol in my right I opened fire. The chambers were emptied in quick succession without visible effect, when he seemed intent on coming to closer quarters, observing which I put myself above that line with an agility that would have done credit to a professional gymnast. He stopped under the tree and saluted me with some sonorous grunts, then disappeared in the woods with the dogs in hot pursuit. I then decided to hunt no more, but to take my rifle or double gun, which I never ever after religiously kept.

On arriving at camp and relating my adventure, Con complimented me by the information that he had not supposed me so great a coward; that if so good a chance had offered him, there would have been pork for supper. The next day, armed with a double gun, I secured three hogs.

Later we demonstrated the fact that a ball fired from a navy revolver three feet distant, would not enter the vitals of a full grown wild hog if directed toward any portion of the forward part of the body. Con did not often indulge in hunting, as he preferred keeping camp and letting Monway and myself look for pork. About six weeks after my first bag for a week. Taking a blanket and tin cup each, and a tin pail to hold rice and make coffee in, and some other things, we went into the heart of the main range, and probably went over ground that was never before gazed on by mortal man. We placed our reliance for pork on a breech-loading rifle and one dog, the others having become disabed.

Toward night of the first day the dog was set loose and soon gave tongue. Con followed with the rifle. In a few minutes a report, followed by distressed hallooing, impressed me that the shot had been a failure and Con was being badly dealt with. Armed only with my knife, I made haste to the spot from which the cries proceeded. There stood Con, in vain endeavoring to withdraw the empty cartridge, his excitement preventing success. Taking the rifle and reloading I fired a shot at the hog, about four rods distant, the ball breaking his spine and one shoulder. Con explained that the first he knew of the hog's whereabouts was making a charge, and that he fired a snap shot when the game was scarce eight feet from the muzzle of the gun. The dog immediately closed but was shaken violently off and pursued. Con's shot had broken one hip and the opposite gambrel. This young porker had pursued the dog four rods in this crippled condition. After my shot the dog again closed with her, and he thought at best she might until life ebbed in crimson flood from his side and he lay dead. There was a very good opportunity to return Con's compliment of cowardice, but I forebore, simply asking his opinion of wild hogs, and if he thought there was any fight in them. He replied that never again would he venture near one until he was sure it was dead. L. KEXT, M. D.

#### THE NEGRO AND THE GAME.

Editor Forest and Stream:

Perhaps a few more words about the negro as a sportsman may not be uninteresting. Some days ago I was taking a little recreation with my gun not far from Palestine. I noticed two negro men beating about the bushes in company with a solitary stump-tailed "yaller dorg." As they had no dogs, I was very much surprised, and I can't imagine what they were about, but I have concluded that they were rabbit-hunting, and that their stump-tail dog was their sole dependence for catching the rabbit. This dog's peculiar build was such that it did not seem to be possible that he could be very swift. I therefore concluded that these two sportsmen would be quite sure to go home at night without any rabbit. At last it chanced that the two sportsmen and my dog came to have a good rabbit pie on Sunday. One of these gentlemen was a powerful man of at least 240 pounds weight; the other considerably less in size, but a full grown man. They had secured no game yet, but were in high spirits and enthusiasm. They were entirely confident that they would revel in all the luxury of rabbit pie at noon the next day. Now, it is my opinion that these negroes would have been a good deal more successful in securing rabbit pie, had they believed that they had an inestimable treasure in it, and that as they contemplated the formidable relic of antiquity, the ancestral instinct to go a-hunting broke out within them in an ungovernable manner and hurried them forth into the road and briar-patches. I was curious to know what they loaded their artillery with. They shot of the biggest sort, such as our white folks would use for turkeys. I noticed that the smaller of the two used a much bigger shot than our white folks do. They have nothing smaller than No. 4 in their vocabulary. Even if they would not turn out to shoot a wren or a tomcat, they would use a smaller shot than No. 4.

Shortly after separating from these two gentlemen I came upon another colored sportsman carrying an old army musket. Just before I reached him a flock of mallards passed within a few rods of him. He shot at them with his gun. With such a chance I would fire every time, but the colored sportsman merely looked at the ducks without putting his gun to his shoulder. I asked him why he did not fire upon them. Said he, "I never pulls trigger till I sees dat the thing I shoots at is gwine to be my meat. Ef I had shot dat ducks I might get one, but it wain't too reasonable dat I might not. Mebbe de ducks wain't too

fur, but I never had a bit o' luck on de whing, and I can't risk my ammeration on onsartainties. Afore I pulls de trigger I must see my meat shore."

Before the unpleasantness the only hunting enjoyed by the negroes was rabbit hunting on Sundays and "possum and 'coon-hunting" on nights. They had no firearms in those days, and had to depend exclusively on the dog for their rabbits, and on the dog and ax for their 'coons and 'possums. Great was the fun which they had on such occasions, as the writer heretofore can testify, he having often been with them both in their Sunday rabbit hunts and their night 'possum and 'coon hunts. To be with them on their Sunday hunts he had to go away from home, but the parental consent was generally readily obtained to go on the 'possum and 'coon hunts, they having the utmost confidence that "our black folks" would take good care of their boy. This was in North Carolina, a good many years ago.

The negroes pursued these sports, particularly 'possum and 'coon hunting, with a wonderful enthusiasm and enjoyment. 'Possum and 'coon hunting may be said to have been their race amusement, just as bullfighting is the race amusement of the Spaniards. And yet since they have become free they have totally abandoned the 'possum and the 'coon as far as I can learn. I cannot speak of the other Southern States now, but it certainly is a fact as regards Texas. The negro now seems to regard it as almost an insult to talk to him about a 'possum. He can stand reference to the 'coon yet, not, however, with a very good grace, but the 'possum is entirely too much for his pleasure. He seems to consider that he has entirely outgrown the 'possum, and looks above him in the social scale, and to look upon any reference to that animal in his presence as an intentional and heartless reminder of his previous condition of servitude. I have noticed this so frequently among our colored people that I am now very careful to abstain from all allusion to the 'possum when in their hearing. I have the negroes in the other Southern States grown so proud as this, I hear, that they have, but could not personally say so. If the negro then the poor 'possum has fallen from the proud position of a glorified monarch to that of a very humble individual, indeed, with a bare tail.

"Since he miscaled the morning star,

Nor man nor fiend hath fallen so far."

The ducks and geese are now leaving us in immense swarms. I hear them during all hours of the day and night and their wild cries are very annoying. They go to the polar snows to do their love-making, but they always come south to live well and grow fat. You hyperborean people send them down to us in the fall dead-poor; we send them back to you in the spring seal-fat. This I suggest is no fair exchange. But is it not strange that these birds should go to the cheerless and barren hyperbores to do their love-making? Why not stay south and attend to that business under the full perfume of the orange blossoms? PALESTINE, TEX., March 13. N. A. T.

#### THE LONDON SOCIETY.

THE annual meeting of the District Fish and Game Protective Society was held at the Revere House March 13, the president, Mr. Gill, in the chair. The minutes of the last meeting were read by the secretary, Mr. Skirving, and adopted. The annual report, read by the president, was also unanimously adopted. The report was as follows:

SEVENTH ANNUAL REPORT. In presenting the annual report of the work of our society, we feel that there is ground for congratulation on the continued success which has followed the efforts made toward the protection of game and enforcing a proper respect for the game laws within the county of Middlesex. No violation of the game laws has been reported to the society since last year's report. Posters containing every information necessary for acquainting the public with the periods of the close seasons, and all persons in the county and to many points beyond our special limits, and we have felt satisfied that our past efforts have been successful to a very great extent in imparting to a large community a thorough knowledge of the advantages to be derived from a proper observance of the game laws. In accordance with a resolution passed at a meeting of our society held in November last, the House of Commons, the Legislative Assembly of Ontario for the passing of an Act to regulate the exportation of game from Ontario, were distributed at various points in Ontario for signature. These petitions, containing the signatures of 1,981 of the ratepayers of Ontario, were presented to the Assembly at its last session. That body, however, decided that though they had not the power to grant the desired relief. The papers have now been placed before the House of Commons. The members of the society have promised his best endeavors to get the much required law enacted. Other sister societies are also assisting with their influence in the same direction. Unless such relief is granted either by way of an Act of Parliament to prevent exportation of game, or by placing a heavy duty on game intended for exportation (either by residents or non-residents of Ontario), for purposes of sale in foreign markets, the game of Ontario will soon disappear from the country. The only exception in a law of this kind should be in the case of wild ducks and geese, as these are mostly shot on large preserves owned by small bodies of sportsmen, who shoot for their own use and pleasure and not for market purposes.

A bill was also brought before the Legislature to amend the present game laws, but as it did not in any way meet the views of the sportsmen, it was thrown out by the House. Our worthy vice-president, Dr. Niven, was delegated by the society to attend in our interests before the committee. Our game laws certainly require amendment on some points, and as it is proposed to hold a meeting of sportsmen at Ottawa shortly, to which our society has been asked to send a delegate, the matter will be fully discussed there and a bill agreed upon so as to obtain legislation at the first opportunity.

The standing of our society numerically and financially is satisfactory. We now number seventy-five members, and as our objects are solely to protect game, fish and insectivorous birds, and to assist in the rigid enforcement of the game laws which sometimes entails a good deal of expense and trouble, it is to be hoped that the public at large will so far encourage us in our efforts by giving the liberal support of becoming members of our society, so that our membership may be at least doubled during the year. The influence of our society is not, however, confined to the limits of the county of Middlesex. We are often called upon for advice and assistance from places where there is no game protection society, but which our large posters have reached. In all such cases the society, either through its individual members or officers, has always cheerfully afforded the ad-

vice or assistance required, and under their directions prosecutions for the illegal killing of game, followed by convictions, have been the inevitable consequence. Some parties have been tried and convicted in the neighborhood of Oil Springs for killing deer out of season through the intervention of one of our energetic members, and another of our members is now investigating a matter of a similar kind in the township of Down. Our society may safely congratulate itself upon its being the only game society in Western Ontario that has taken any interest or prominent part in game protection and the extension and observance of the game laws, and in the future as well as in the past will always be found to the fore. In conclusion, we would suggest, in the hope that it may be acted upon, the formation of really good and strong game and protective associations in West Elgin, Kent, Bothwell, Lambton and Essex, and that such societies keep up constant correspondence with each other, and act in unison in obtaining any further legislation that may at times appear necessary to protect our game and to further the interest of game protection generally. It is to the interests of every genuine sportsman to take the matter up and carry it through, and the assistance and experience of this society will be at his disposal.

The very energetic fishery inspector of the district, Mr. Peter McCann, one of the vice-presidents of this society, reports that there have been no prosecutions for the violation of the fishery regulations since our last annual report, which shows that he is attending faithfully to his duties.

W. C. L. GILL, President.

LONDON, MARCH 13, 1883.

The following were elected officers for 1883: President, Dr. Woodruff; Vice-Presidents, Messrs. W. C. L. Gill, and P. McCann; Secretary, D. Skirving; Executive Committee, George Kelly, Jno. Puddicombe, T. H. Smallman, R. Wallace, Dr. Niven, C. A. Stone, R. Mercer, A. Chisholm, John Cousins; Finance Committee, Messrs. Puddicombe, Stone and Kelly.

Dr. Niven reported that he had appeared before a committee of the Local Legislature in reference to legislation bearing on the protection of fish and game proposed to be passed at the last session, and had found the bill proposed by Mr. Monck somewhat unsuitable and inhospitable. It proposed a tax of \$25 upon any stranger shooting within the Province, which precluded the possibility of taking a visiting friend for a day's shooting and would permit American residents to send into the Province and shoot to any extent they choose on payment of the prescribed fee.

Mr. W. C. L. Gill was appointed a delegate to attend the meeting at Ottawa referred to in the president's report.

#### HINTS FOR NEXT SEASON.

THE other side of all enchanting tales would not come amiss, as sportsmen are now making preparations for future trips to unmolested game resorts.

1. Never locate camp near the feeding ground of large game, to enable you to get the best and first chances at what could be seen there. I will give the reasons after you return to your homes with bad luck pictured on your faces.

2. Do not go fishing or hunting before October 1 without a good fly mixture, in which the odor of tar can be detected.

3. My diary, date January 23, 1879, says: "Don't do down the Suwanee, River, Fla., without an antidote for the bite of water-moccasins and scorpions. Remain under shelter until the dew disappears, and do not drink the waters of the State until it has been boiled. Provide shelter for mosquitoes outside your tent before sunset."

4. After establishing headquarters remember that game and the sportsman in American forests will not be around to dine with you.

5. In Northern wilds rubber clothing is as necessary to your enjoyment as a good fly-rod.

6. If you think a gun with single grip to hold the barrels down as good as the best, put it in some other fellow's boat. If a \$5 gun shoots well, find the mark the striker made when it backed out of one shot a year ago. The gun has strayed since. No information worth!

7. If you fail to find a guide whose services are worth enough in summer and autumn to enable him to get a winter supply of meat without criss-hunting it, get along without one. NED NORTON.

COLERBROOK, New Hampshire.

#### PHILADELPHIA NOTES.

CAPT. A. H. CLAY has lately returned from his favorite ducking grounds near Chinesteque Island, bringing with him eleven wild geese and one hundred and fifty baldpates. These he and a friend killed in a few days' shooting. He tells me all the oystermen of the Chinesteque and Sinepuxent waters carry carbines or muskets in their boats and shoot into the flocks of geese and brant at long distances with ball as they sail by. This has the effect of frightening the fowl from the feeding grounds, and they leave the bays, make their way outside the beach, and sit beyond the breakers until evening, when they return to the bay to feed.

About Sinepuxent Sound there appears to have been a strange mortality among the little ruddy ducks. Many have been found dead on the mainland some distance from the water, and not a few have been picked up on the beach. During the past week it has blown so hard on the days allowed for box-shooting at Havre de Grace, that it has been too rough to comfortably lie out in a box, consequently there has been but little shooting, although redheads and blackheads were plentiful. A duck supposed to have been an English teal was brought into Kinder's for stuffing last week, it was killed at Havre de Grace. No snipe have arrived here yet, the first of the past week was warm enough to bring them, but it closed wintry and blustery, and we have given over looking for them until the next pleasant spell.

Brant are in great numbers in both Barnegat and Tucker-ton bays, but the fowl shot poorly.

In our own river springtails are very numerous and the marshes on the Delaware shore are now black with them. It is very hard to get shooting at these ducks on these marshes unless one sinks a box in the mud where they come to feed, puts a few decoys out and waits for the arrival of the fowl. The job is a dirty and hard one, and scarcely repays the trouble, for the ducks soon steer clear from the place where the hide is made after being shot at a few times and resort to other feeding grounds, of which there are hundreds of acres.

Last week a large flock of Canada geese was seen flying northward high above our city. HOMO.

EXPANSIVE BULLETS.—Pittsfield, Vt.,—Editor *Forest and Stream*: I called on our gunsmith and had him turn a bar of steel, about  $\frac{1}{16}$  in. in diameter at base,  $\frac{1}{8}$  in. at point,  $\frac{1}{4}$  in. long, filed like a twisted drill, for drilling a hole through bottom of moulds to receive pin which projects into the point of the mould  $\frac{1}{16}$  in., tapering from  $\frac{1}{8}$  in. at point of bullet to a blunt point  $\frac{1}{16}$  in. from base of ball. This I find just the thing to turn a Thomas cat or ground-log inside out. For deer make the point a little shorter, leaving more solid base to increase penetration. On the shank of bar, at the base of ball, force or clamp on projecting lips, with cutting edge to face the mould and make the ball perfect. To make it solid, use a pin that will just reach the point of the mould; the pin can be finished to make the point of the bullet flat or round, as desired. My mode of loading the Winchester rifle, model 1873, with this bullet is as follows: Into the rifle put a primed shell; then into the muzzle turn 70grs. of P. G. rifle powder; next over the muzzle place a fine linen patch 1 in. in diameter, using care to place the bullet in the center of the patch; then with the driving rod, the end of which is countersunk to fit the bullet) drive it home. Owners of Winchester, with this bullet cast solid, and loaded as described, will find the arm very accurate at long range. They will also find the flight of the expansive bullet up to 250 yds. (which is as far as I have tested it) very accurate, and with the magazine full of regular cartridges you are prepared for any game that breaks cover. The regular ammunition for the rifle made expansive in this way increases the killing power of that arm fourfold.—EDWARD SMITH.

THE BOX-HUNTER OF BASH-BISH.—From a letter sent to us by our occasional correspondent, Charles Lannan, we copy the following: While recently looking over some of my notes of summer recreation, I found a fragment which I think will interest your readers. I had been spending a few weeks with a relative who has a summer home in Berkshire, and where the ruling spirit was a boy—a wild and noble little hero—about thirteen years of age, who has the unspeakable pleasure of spending his school vacations among the mountains, and it was from one of his journals that I filched the following:

ANIMALS' CATCHES.  
June 23—1 small woodchuck.  
June 24—1 large woodchuck.  
June 25—1 medium woodchuck.  
June 27—2 large woodchucks.  
July 15—1 large woodchuck.  
All killed by my dog Major.  
Chipmunks and rats in cornfield—a good supply.

SNARKS.  
One rattie killed and brought home.  
Of common snakes—a big killed.  
TROUT.  
In eighteen days in June killed 284—one day 34.  
Sunfish, suckers and pickeral a big lot.  
Expenses for gear tackle in June, \$1.00.  
My Crampton-Lannan rod has been all smashed to fragments.

One night when all the family were in ecstasies over a magnificent aurora, this Nio-rod came rushing out of the house with this exclamation, "What a glorious night for 'coon hunting!'"

THE POUGHKEEPSIE CASES.—Poughkeepsie, March 6.—Editor *Forest and Stream*: G. A. Maas, the game dealer, was found guilty of having in his possession seventeen rabbits on the 2d day of February, which he offered for sale on that day. This man, in connection with others, were indicted for a violation of the game laws. It is only a small affair; you simply had a rabbit at the wrong time and although I know you have committed perjury, I will make the penalty more severe in your case and fine you ten dollars." This very judge has sentenced persons to the State prison for milder offenses than perjury. How very encouraging all this is to persons who are anxious to protect our game. Kaess was indicted for having in his possession 20 partridges and 10 quail; Smith Bros. for having in their possession 20 quail, and March 17 rabbits, of which were seen and examined by Brayton, the game constable, and in Kaess's case many more. The two first are let off with a fine of \$5 each, and the latter, with perjury thrown in, \$10. Is there any use in trying to uphold the game laws?—S.

NEW HAMPSHIRE NOTES.—New Market, March 12.—Partridges are scarce; there were some woodcock in their season. Within two or three years there have been a few quail around here, whistling Bob White almost always from an apple tree. We have never heard of any being shot around here. Gray squirrels were very plenty last fall; and a great many were killed. Foxes and white rabbits are abundant this winter, but it has been a bad time for the sportsmen, as after most every snow storm it would rain and form a crust, thus making it impossible to see a track. But on every favorable snow every man that owns a dog, (no matter what he is as long as they can call him bound) is out either foxing or rabbiting. Quite a number of both kinds of game have been killed. A party of nine, with three dogs, went out the other day and got fourteen rabbits. The handsomest fox we have seen this winter was shot by a young man at Parkers Falls. It was a cross between the red and gray and weighed over eleven pounds.—W.

THE SHONGUM COMPANY.—At the annual meeting of the Shongum Company, of Morris-town, N. J., held March 13, the following officers were elected: President, Henry W. Miller; Vice-President, Charles H. Raymond; Secretary, J. Frank Lindsey; Treasurer, Henry T. Hull; Counsel, Mahlon Pitney. Directors—H. W. Miller, E. M. Quimby, H. T. Hull. Committee on Membership—Francis Child, J. Frank Lindsey, Geo. B. Raymond, Henry M. Smith, Mahlon Pitney.

AMERICAN WOOD POWDER.—In reply to several queries in regard to the American wood powder, we would state that the Forest and Stream sent at some time ago submitted a quantity of the material to a chemist for an exhaustive test which is now in progress. The result will be published in due time.

SOUTH AMINGTON, MESS., March 19.—As the season for hunting foxes in this part of the country expires by mutual consent about the first of March, I will give the number of foxes, minks, coons, etc., captured by members of the South Amington Sportsman's Club during the last five months: Wm. B. Lincoln, 19 foxes, 4 minks, 4 coons; M. Hall, 13 foxes; Seth P. Gurney, 1 fox, 4 minks; C. B. Smith, 1 fox; D. B. Howe, 1 fox; E. E. Bates, 1 fox. Total, 36 foxes, 8 minks, 4 coons. At our annual meeting, March 1, Mr. Wm. B. Lincoln had his entire collection of fur on exhibition. David, who has been very unfortunate considering the number of days, and promises to show a better record next season. Mr. P. H. Smith wishes to inform his numerous friends throughout the country that his total score for the season was one squirrel.—SASACTS.

MUSKOKA DEER.—Draiford, Ont., March 12.—A friend of mine who has just come from Muskoka says: "I never saw such a slaughter among the deer by wolves. The snow was deep with a heavy crust, so that a man or a wolf could go with safety on any place, but the deer would break through at every step. He said their legs were skinned to the bone, and some were found with their throats bitten through, and others partly eaten, in places where they had yarded up for the winter. He thinks not one has escaped. Then, in some localities where there are no four-legged wolves, two-legged ones are, if any thing, worse. Muskoka was a good hunting ground for deer. I was there last fall and found deer in plenty; in five days I got five deer. But I am afraid it is all up now.—G. A.

CHICAGO, ILL., March 17.—The ducks have captured the local sportsmen, and every house about the city is covered with them. At English Lake there were plenty of ducks sported. The Kilmannans are at Lake Saucashine hunting, and have sent in plenty of the feathered animals for the boys. Reports from Putnam, on the Illinois, are that ducks are now plentiful and the feeding fine. The overflow of water is fast passing away, and in a day or so the boys will be taking a turn down on Illinois Bottoms. The Kankakee is full of mallards, redheads, and all sorts of ducks. Messrs. Howe, Taylor, Gillespie, Cronin and others are out.

TENNESSEE.—Savannah, March 3, 1883.—The season just past has been the most discouraging I have ever known here. Warm weather and consequently dense cover made the bird shooting a failure, and notwithstanding the excessive crops of mast and corn the ducks go in the go-by. Since January 1 the weather has been unfavorable to all kinds of sport, nothing but rain and mud repeated ad nauseam. There is this consolation, that if few quail were shot there are all the more left to breed for next season, and I trust that next November Bob White and relatives will "bob up serenely" and in great numbers.—W.H.

MICHIGAN.—Detroit, March 17.—The market hunters are sending in large numbers of redhead ducks of excellent quality. In fact, the market is glutted with them, but as the weather is still cold the dealers hold them at seventy-five cents per pair. Although the winter has been one of much severity, and many sportsmen have come to hand, I estimate that grouse and quail have had plenty of food and fuel and are promisingly numerous in number.—B. F. W.

#### THE FUR MARKET.

THE following prices are for prime skins only, according to size, color and quality, as realized by the New York commission merchants. Ship in bags or boxes add to freight, Mark bales, etc., with your initials:

Antelope—North America, raw, 7 lb.	\$ 3.00	35
Dressed, as to quality, 7 lb.	1.25	1.50
Beaver—Labrador, 7 lb.	2.75	3.00
Rocky Mountain, raw, 7 lb.	2.25	2.50
Elk—Pacific States, raw, 7 lb.	2.75	3.00
Elk—Pacific States, dressed, 7 lb.	1.75	2.00
Western skins, 7 lb.	2.00	2.25
Dressed, as to quality, 7 lb.	8.00	10.00
Mountain Deer—Western, 7 lb.	9.00	10.00
Reindeer—American, raw, 7 lb.	2.25	2.50
Dressed, as to quality, 7 lb.	1.00	1.25
Deer—Labrador, 7 lb.	2.75	3.00
Lake Superior and Canada, 7 lb.	3.00	3.25
Upper Missouri, raw, 7 lb.	1.75	2.00
Lower Missouri, raw, 7 lb.	1.50	1.75
Badger—American, large and full turred, each	8.00	10.00
Bear—Hudson's Bay, black, large, each	15.00	20.00
Bear—Hudson's Bay, brown, large, each	10.00	15.00
Southern U. S., black, large, each	7.00	10.00
Cuts from 25 to 35 of the above.	8.00	10.00
Bulls' robes, in bales	1.25	1.50
Buckskin—Western, 7 lb.	1.25	1.50
Pacific Coast, 7 lb.	1.00	1.25
House, each	1.00	1.25
Ermine and white weasel	5.00	6.00
Fur—Dark, each	4.00	5.00
Pale	9.00	10.00
Reddish	5.00	6.00
Fox—Red, United States, each	1.00	1.25
Red, Territories	1.00	1.25
Cross, ordinary	3.00	4.00
Gray, United States	1.00	1.25
Kill, North America	2.00	3.00
Silver, North America	2.00	3.00
Minnesota	2.00	3.00
Marion Dark	2.00	3.00
Pale	1.00	1.25
Mink—Pale, Southern U. S.	1.00	1.25
Pale, Western United States	1.00	1.25
Dark	1.00	1.25
Dark New England	1.00	1.25
Dark, Quebec and Halifax	1.00	1.25
Muskrat—Canada and Eastern	1.00	1.25
Spruce, Western United States	1.00	1.25
Spruce, Southern United States	1.00	1.25
Fall, Canada and Eastern	1.00	1.25
Fall, Western United States	1.00	1.25
Fall, Southern United States	1.00	1.25
Opuscula—Ohio, Canada and common	1.00	1.25
Other—Labrador, casual	1.00	1.25
Northern United States	1.00	1.25
Western United States	1.00	1.25
Southern United States	1.00	1.25
Raccoon—Michigan	1.00	1.25
Upper Missouri	1.00	1.25

Green skins are worth less than clean, dry, well-handled skins		

respected hermit, was born in Enfield, N. J., October 4, 1816. He worked on a farm until he came to Lawrence in 1846, when he went to work on the dam, and drove team. He established himself as a fisherman at his present location, paying the Essex company as high as two hundred dollars a year for the privilege of fishing between the falls bridge and the dam. He followed the business here for many years, employing about eight men during the season, and it was not unusual to see thirty to forty teams call at his market daily to purchase fish. He has sold his many as 3,000 eels in a single load to Lowell parties, for two cents a piece. He has been fish warden for twelve years, and is paid by the city forty-five dollars annually. Fishing within 400 yards of the dam is not allowed. Beyond these limits fish can be taken with hook and line at all times, and with net and seine only three days of each week from March to June; a fine of fifty dollars is imposed on each fish taken inside the prohibitory limit, but this high reward does not stimulate Mr. Noyes to any unnecessary arrests. Thirty years since this March, he resolved to live in solitude during the years allotted him, in a one-room cottage beside the Essex Company's dam. The entrance to his retreat is from No. 3 South Broadway. From this barren ledge he has reclaimed about one-eighth of an acre for his vineyard, yielding about fifty gallons of wine annually, for which he finds a ready market, at four dollars per gallon. This little cot and vineyard he has laid out for the Essex Company for many years, but to retain the title of the property the company was obliged to charge a nominal rent. He has been married twice, and has been a widower over forty years. He had one child, who died in infancy, and has no living relatives. He is the only survivor of a family of seven sons and six daughters. He has voted the Democratic ticket from Jackson to Hancock with one exception, when he voted for Abraham Lincoln. For a man of eighty years, his appearance, physically, is very good. His sight and hearing are well preserved; he reads without spectacles, and does his own house-keeping, cooking, washing, and mending. He smokes and uses tobacco in other forms, and is not averse to the use of liquor. He has not been sick nor had a doctor in twenty-five years.

**FISH AND FLOWERS.**—That there is a vein of poetry in the rough fishermen of the coast is shown by the following testimony taken by Prof. Baird, from a fisherman of Narragansett Pier, and published in "The Professor's report. It shows that under a rough exterior there was not only observation and memory of the sequence of events but also a poetic feeling that is charming." Question.—"Did they [the squeteague] come much earlier than used to Point Judith this year?" Answer.—"About the same. They expected them in February and got the seines ready. They had them in the water in March. I always judge by the dandelions; when I see the first dandelion the sea come in. I catch the herring, and when the buds are swollen fall then our traps go in. When the dandelion goes out of bloom and run to seed the seeps are gone. That is true one year with another, though they vary every season. I am guided by the blossoms of other kinds of plants for other fish. When high blackberries are in bloom we catch striped bass that weigh from twelve to twenty pounds; when the blue violets are in blossom—they come early—you can catch the small eels. This struck me as very singular, but I thought it was in blossom—my own forefathers."

**BOMOSEEN LAKE.**—(Chesham, Vt., March 16.)—At last Vermont has awakened to the necessity of preserving the fish in her waters. For several years we have had a law protecting trout. Last fall a law was enacted for the preservation of fish in the lakes of the State, and a special law for Lake Bomoseen in this place, the largest body of water in the State. The fish have been caught by nets and gear in the spawning season, and this was impossible to stop them from doing so. The fish were sold for a low price. Legitimate angling will now be free. The lake is some nine miles in length, and from one-half to three miles wide; clear, deep and cold water with bold slate shores and fine feeding grounds. It is stocked with rock bass, pickerel and Oswego bass that weigh as high as eight pounds. The pickerel attain twenty-eight pounds. A beautiful island is in the lake whose shores are dotted with resorts. The village, five miles from the lake, is a pleasant place. In August and September about the color of betahabara wood, there is another feature in the wood that is somewhat unique and singular. I mean its cleansing and softening qualities. I have noticed when I have been rod-making—amateur rod-making—and I have sometimes had dirty and oily hands, if I take the dust and scraping from the betahabara wood and rub into the hands thoroughly with the soap, it removes every particle of oil mark, keeps the hands soft and clean, the finger-nails especially so. This struck me as very singular, but I thought it was possible that anyone working this wood all the time might get used to it and not have the same effect.—W. DAVIN TOMLIN.

## Fishculture.

### THE COLD SPRING HARBOR HATCHERY.

ON Wednesday, the 14th, a party of about two dozen gentlemen and four ladies visited the hatchery station of the New York State Commission at Cold Spring Harbor, Long Island, by invitation of Mr. E. G. Blackford, the commissioner in charge of it. The party consisted of relatives of Mr. John D. Jones, who so kindly gave the use of this station to the commission, and representatives of the city press. A special train was placed at their disposal by courtesy of the Long Island Railroad, and the party arrived at the hatchery about 11 A. M., where they were received by the superintendent, Mr. Fred Jones, and Mr. E. G. Blackford. The hatchery is a part of the water could be seen in old ponds below the dam which at high tide are covered with salt water up to the edge of the ponds, the old wooden mill which lies almost below the reservoir, the harbor stretching out into the Sound, and the Connecticut shore and bay.

and used in two series of troughs, numbering ten altogether, out of doors, making it practically a three-story hatchery. From the door of the building a stone can be thrown into salt water at high tide. The station has been supplied with eggs this year by Prof. Baird, of the University of California. The present station has the following: 350,000 Peabody salmon from Mr. H. H. Buck, Bucksport, Me.; 100,000 land-locked salmon from Mr. Charles G. Atkins, Grand Lake Stream, Me.; 100,000 brook trout and 1,000,000 whitefish from Mr. Frank N. Clark, Northfield, Vt.; 50,000 German brook trout from Herr von Herr von Behr, president, Deutsche Fischerei Verein, Berlin. The salmon and trout are all in the usual wooden troughs, and were nearly all hatched. The whitefish were in the McDonald glass jars, and in the glass aquaria in which they lay, were the longest and best of the golden side and carp, three to five inches long, and some eggs of the tomcod, the first salt water fish attempted at this station.

Prof. Rice accompanied the party and with the microscopes of Messrs. Blackford and Martin viewed the visitors the circulation of the blood and the formation of the embryo salmon. Prof. Rice, it will be remembered, experimented with the hatching of oysters at Fulton Market last season, and intends to try it at Cold Spring Harbor again this year. The New York Times of March 15 gave the longest and best report of the formal opening of this station, and we make the following extracts from it:

"The position of Cold Spring is admirably adapted for the purpose of fish-culture, and the number of natural advantages, and in the experience of those having some acquaintance with fish-culture it was declared by them to be the best in the country. In the first place, water can be supplied from springs that never fail; in fact, the whole tract seems to be leading up with water derived from natural sources. Then, again, the water is at just such a height as to give the necessary fall, so that no pumping is required, while its close proximity to the salt water of the Sound will permit of the hatching and rearing of the fish to maturity, and the water is of the highest quality of John D. Jones, Esq., a lease of 10 years has been given, without any cost, of a piece of land of at least 20 acres for the use of the State."

Last year, when the general appropriation was made by the State, it was estimated that at least some \$5,000 would have been allowed to the Cold Spring fish hatchery, the remainder, \$12,000, to go to the Caledonia Works, but only \$1,000 were allotted to Cold Spring. This year, so far, no special appropriation has been made, but the State has been very generous in the amount of the work and the excellent beginning made, it is quite desirable that an additional sum shall be granted for Cold Spring—some \$1,000—or that a larger portion of the appropriation thus was allowed it last year shall be placed at the disposal of Mr. E. G. Blackford, who has devoted so much of his time and energy to the development of this special hatchery."

"The reasons why there should be more than one State hatchery are quite obvious. Though the work done at Caledonia has been very successful, and the hatchery at the southern portion of the State have found it both difficult and expensive to procure fish from a distant point. Not counting risk of loss, there was always a large item of expense. When trout had to be forwarded from Caledonia to points near New York City the fish had to be sent under the charge of an experienced person, whose fare and time had to be paid. It was hardly just that one portion of the State should receive the larger part of the fish, while another could derive but few. But the advantage of having the hatchery at the southern end of the State, though at first little understood, are to-day beginning to be better appreciated. Means of communication between distant points are more rapid and continuous in our large city like New York than in the interior. But the strongest reason why a hatchery should be established at Cold Spring is that advantage for a hatchery is that material of all kinds, even the eggs themselves, can be more readily obtained, and the fish, when produced, can be more readily and safely distributed. The position of Cold Spring has advantages of an idea that the State had no business to make any experiments. Now, it is quite well known that there is no place in the whole country where trout can be reared as advantageously or with as little expense as at Cold Spring. It is owing to the undulating surface of the land, the water to the abundance of food that trout are more plentiful among Long Island trout-risers than elsewhere can not be stated, but it is quite certain that the trout establishments of the South end of Long Island will be able to supply the market with a quantity. It is a mistake to find fault with any commissioner who is desirous of experimenting with the sole desire of increasing the stock of fish. Trout alone can never meet the demand of the market, and the State must have other species of fish to become the common food of the people. At best it is an exotic. It requires a peculiar kind of water and of a certain temperature, two conditions which are not always to be found. It is all well enough to stock particular streams with trout, but it is not wise to make such experiments to our anglers, but poor people do not have time to catch these fish. The stock of trout which is sent to market is always limited, and commands a price which persons of moderate means cannot afford. In fact, trout is food for the rich and not for the poor."

"The Cold Spring Hatchery will, of course, hatch out trout, but it is believed that, when the season comes, it will devote its attention to shad. As to the experimental part of the work, with the advantages of Cold Spring, it is right at its door, it ought to try and propagate the striped bass, the Spanish mackerel, the cod and the sheepshead. With improved apparatus and a better acquaintance with the habits of the Connecticut River salmon, with the wide geographical distribution of trout eggs, of shad eggs, and the rearing of the fish present no possible difficulties. It would be wise, then, on the part of those having the Cold Spring hatchery in charge to extend their labors, for there can be little doubt that in time the State can be restocked with those fish which were once so abundant."

"The experiment will be tried with the whitefish of placing some of them in the larger fresh-water lakes of Long Island. Mr. E. G. Blackford and Mr. Fred Jones have been very successful in their distribution, it is not impossible that it might adapt itself to its new surroundings."

"With the fall of water, which was rightly described by those who prospected Cold Spring as 'inexhaustible,' advantage should be taken to make a dam to serve the purpose of running a small turbine wheel, so that a continuous source of salt water from the Sound could be had. The expense for this, and for the construction of a few salt-water ponds would be very slight. If such inclosures were built, the eggs of the cod, obtained by the million at Fulton Market slip, could be fertilized, hatched, and carried out into the Sound. Should any sole be sent in the future, instead of wasting them by throwing them away, they could be kept, made to propagate, and from the parent stock millions of young fish could be procured. Striped bass, Spanish mackerel, sheepshead, might all be experimented with at a very trifling cost, while the actual routine work of Cold Spring would be done by the hatchery of March 15, said."

"All present on this pleasant visit, to many of whom fish-culture was a novelty, expressed themselves delighted with the progress made at Cold Spring, and the work done by Mr. E. G. Blackford and Mr. Fred Jones. The hatchery was well equipped. After a couple of hours spent in inspecting the hatchery the whole party partook of a luncheon at the house of Townsend Jones, Esq., a brother of the gentleman to whose liberality, in great part, the hatchery at Cold Spring is due. The New York Times of March 15, said: 'Both Commissioner Blackford and Mr. Matter were very proud of the hatchery, and have great hopes of it, particularly because of the salt water facilities. They intend to a short time to make a constant supply of sea water, and the experiments that are

to follow will, doubtless, be extremely interesting. Striped bass, fresh mackerel and oysters will be experimented on, and from the unusual facilities great things are hoped for." The Times of Sunday, March 18, again refers to the station and the pleasure of visiting the Cold Spring Hatchery, on Long Island, the new work of the New York State Commissioners, was the presence of several young girls, in the company of the superintendent, who were busily engaged in curing for the young fish. As there is nothing infamous about such modesty and modesty of handling, with some common sense, being all that is necessary, women would be well adapted for this special work. Some of these days we may have a regular trained corps of 'fish nurses.'"

### SALMON IN NEW HAMPSHIRE.

**Editor Forest and Stream:**  
I enclose you a letter which I have just written for the Manchester Mirror, which you may find of interest.

I have just returned from a visit to the State hatchery house at Plymouth, which is in excellent condition and order under the careful management of Superintendent E. B. Hodge, who proves to be the "right man in the right place."

He has now in the trays 400,000 Atlantic salmon eggs, 125,000 of which were taken at the hatchery from salmon which went up the Merrimack last year, and the remainder came from a large spawning party of Massachusetts, and was kindly presented by Prof. Baird, of the U. S. Fish Commission. In addition to these he has 125,000 land-locked salmon eggs, 15,000 trout eggs, and 200,000 whitefish eggs, the latter also presented by Prof. Baird.

These are all in prime order. Mr. Hodge has introduced an improvement over previous practice by placing a large block of ice at the head of each trough, thereby cooling down the spring water to about the normal temperature of the water in the rivers and ponds, keeping the hatching fully a month longer than it would be likely to come out of the shell. This will keep them all back till into May, when the waters in the brooks and rivers are in suitable condition to receive them.

Mr. Hodge also tells me that many salmon found suitable spawning beds below Plymouth last season, in the towns of Bridgewater and New Hampton, and confirms my statement that the Merrimack was literally swarming with the young fry of the fish. Two or three salmon were seen in the ponds at the breeding trout in the ponds are looking well, and the young *Salmo trutta* are perfect beauties, and there is a vacant space saved in the hatching boxes for another lot of eggs, which are daily expected from California.

the common perch, which the front of the first season have also, disappear, as do the red spots, and at the end of the second summer they once again assume the salmon coloring and is ready to seek salt water, or at least the majority of them; for from what we have noticed I am inclined to the opinion that some of the "stools," as they are called in Great Britain, do not go down to the sea, till the third season. Two years, if the best, may be taken as a "fixed fact," as John Tyler said.

Now let us review briefly the history of fish-culture on the Merrimack River for the last few years. Penobscot eggs were landed by the Commissioners of New Hampshire and Massachusetts and planted in the Penobscot river in 1872 and 1873. In 1873 the whole plant was made in the Connecticut. In 1875 and 1876 some young trout were placed in the head waters of the Merrimack, and here the labors of the penobscot commissioners began, and I say the present board, as two out of three are still in office. In 1877 and 1878, no Penobscot eggs could be procured, and the commissioners were indebted to Professor Baird of the U. S. Fish Commission, for a supply of California eggs. These I hatched out, much earlier in the season, and were planted through the ice and probably froze to death or starved to death, as nothing has ever been heard of them since.

In 1878 the hatching house had been built at Plymouth and a few eggs were procured from salmon which had found their way up through the new fishways, and these were hatched at Plymouth in the spring of 1879, together with a fresh lot of California eggs, and slightly a few from the Penobscot. Since then, in 1880-1882, there have been large and increasing plants of Penobscot and native Merrimack salmon.

From and after this coming spring we have every reason to expect the return of salmon in large numbers, and it is the duty of every citizen of New Hampshire, as well as of every true sportsman, to protest most earnestly against any such turning loose of the "robbers of the river" again.

Merriamists, through the Legislature and commissioners, has acted most honorably in this whole matter. She has helped stock the river, she has built fishways, and she has passed laws against netting and seining, and her commissioners have endeavored most faithfully to carry them out, and she now fights those petitioners in the Legislature, and it is impossible on New Hampshire, through her press, to come to her aid.

This is a long letter, but it is impossible to make it shorter, and I have omitted much that I should have liked to say.

The fishways might, perhaps, be somewhat improved, but they are all right when there is an average amount of water in the river, and as all the salmon except one, which has been seen at Plymouth, taken at night, it shows that the fish run at that time, when there is usually plenty of water over the dams and in the fishways.

Yours truly,  
SAMUEL WEBBER.

BLACK BASS IN GERMANY.—A postal card from Mr. Eckardt, dropped at Southampton, England, February 24, announced his safe arrival there with all his fish. A private letter from Mr. Max von dem Borne, dated March 3, acknowledges the receipt of seven small-mouth and forty-four large-mouth black bass.

## The Kennel.

### FIXTURES.

#### BENCH SHOWS.

March 25, 27 and 28, 1883.—Domination of Canada Kennel Club Bench Show, at Ottawa, Canada. Entries close March 12. Charles Lincoln, Superintendent.

APRIL 4, and 5, 1883.—Western Pennsylvania Poultry Society's Eleventh Annual Show, at Erie, Pa. Entries close March 19. Chas. Lincoln, Superintendent.

MAY 8, 9, 10 and 11, 1883.—Westminster Kennel Club, Seventh Annual Bench Show, at Westminster, England. New York City. Entries close April 13. Chas. Lincoln, Sup't.

#### FIELD TRIALS.

November 19, 1882.—Eastern Field Trials Club, Fifth Annual Trials, at High Point, N. C. Entries for the Derby close July 1. For the Stakes, close Oct. 15. For the All-England, close Nov. 1. W. A. Croser, Secretary, Flatfish, Long Island, N. Y.

December, 1882.—National American Kennel Club, Fifth Annual Trials, at Grand Junction, Tenn. D. Bryson, Secretary, Memphis, Tenn.

To insure prompt attention communications should be addressed to the Forest and Stream Publishing Co., and not to individuals, in whose absence from the office matters of importance are liable to delay.

### NATIONAL AMERICAN KENNEL CLUB DERBY.

THE following entries for the National Derby have been received since I last published this list:

96. HAM IV.—Edward Armstrong, Gnosmont, England, liver and white English setter dog, Jan. 7, 1882, Diamond—Slut II.

97. FAN.—Edward Armstrong, Gnosmont, England, liver and white English setter bitch, Jan. 7, 1882, Diamond—Slut II.

98. DRAB.—Edward Armstrong, Gnosmont, England, liver and white pointer bitch, Feb. 3, 1882, Bang II.—Jane.

D. BRYSON, Secretary.

MEMPHIS, TENN.

### A CLEVER RETRIEVER.

THE dog always has been a curious subject. He is petted by one and hated by another. Those who love won't hear anything but about his faults, and those who hate won't hear anything but about his virtues. I have known a dog who was called "Dixie" dearly loved a good dog, and the following story is told of a retriever in his own graphic way in his handbook on the "Dog Dog."

In the winter of 1871, after the season was over, I saw two excellent young retrievers, Mr. Gorse's son, and his son, were broken by an old servant of mine—merry, light-hearted and full of spirits at the kennel, or when first loosed from it; chasing their own tails, with arched backs, and hark knocking over the pretty daughter of the keeper, who might have been the model for Frith and Ansell's famous picture, but subdued and sensible, and full of what Oxford tutors call "application" when sixteen-stone-five took down the gun, and accompanied me to see how much they knew of the rudiments of the game.

"They can both go, sir," he said, "if you be minded; I can send which I like, and 'Other will wait her turn." I did not quite expect this, and yet, very seldom see it—once in a while, yes, perhaps, and when such a thing occurs, I take care to make a note of it, or, as collectors say, I "stick a pin through it."

A busy little spaniel went with us to push out the rabbits from some rough, level of about ten acres, with wide ridges, cut in it, for the pretty keeper is rather slow upon a rabbit running "for the bare life," and he can't, he says, "get on 'em at less than nine yards"—or couldn't until he found out that a dog "has a right to take a ridge, and stop one on the east or scampers; so he said, 'I shoot at the place, and there they are, white side upturned, nine times in ten.'"

Well, we went on, and this time a couple of boys in light livery in the old water, all three dogs behind, and when we got to the gorse he sent in Daisy, the little

cocker, a white one with a liver head, and flecked body, legs, and nose. But that her tail was barbarously shortened to about three inches. It might have passed for one of Mr. Phineas Bullock's, though she was no bull, was bought—as many a good one has been and will be—of tramps in the road just by, who, no doubt, "borrowed" her ("hustled" is, I believe, the rogues' pleasant phrase), while her owner was "dramming."

She divel under the thorns and gorse as though she liked it, and the keeper hit the rabbit as he spurted from his concealment, but he dragged his hind legs along for shelter, and Daisy dropped and began wailing her apology for a tail, and rubbing her head upon the green hawthorn to clear them for the next encounter. "Which is it to be, sir?" said the breaker, touching his low-crowned hat, which tilted so tight and was so hard that he seldom took it off, except, as he said, to lady folks, or when he drank my poor health, and I then saw that the two young gorse puppies—were about nine months old—were both down-charging.

"Get," I said, "for choice."

The old man flipped his finger as he looked at her, and in she went.

"Call her back," I said, as I saw her feathering across the trail, "and send the other."

"Almost too much that," he said, but he croaked his little finger, and put the edge of it to his mouth, and gave a shrill whistle—an achievement I could never learn—and back she came, but rather mortified. "Come behind, Jet," he cried, and stung the other, and she went in, the other dropping steadily and obediently.

Presently there was a shrill squeak, and a rush in the bushes, and Rose vaulted over the gorse with the crippled rabbit alive in her mouth, and brought it to the keeper's hands.

"Think that 'ullo do, sir?" said the feather-weight.

"Yes, my man," I said, "very well. Go on and prosper." And we parted, mutually satisfied.

### THE NEW COCKER CLUB.—Ann Arbor, Mich., Feb. 27.

*Editor Forest and Stream.*—Scarcely a week passes by that I do not receive from your columns letters in regard to the new cocker organization, as well as earnest inquiries about what I consider the "true standard of the genuine cocker spaniel." In the columns of the FOREST AND STREAM I have read letters from Mr. C. B. Elton, Mr. J. H. C. Worcester, and throughout the works of "Stonechange" does he attempt to describe, with any degree of accuracy, as to points and standard, the "genuine cocker," but on the contrary everywhere refers to the common "spaniel cocker," which he says is "a kind of field spaniel, except the Sussex and clumber." Now if this is true, it follows that the cocker is nothing else than a wongrel. All spaniels ("except the Sussex and clumber") are, he says, tinged with the cocker, and he says, "I am of opinion that I am one of many who do profess to have an intelligent knowledge of what the true cocker is, and there are many who do believe that the cocker of the A. C. S. Club is not in accordance with that authority, which is the only authority that I know of."

And the true cocker. Therefore, it is both our determination and duty to restore the cocker to his true position, and to disassociate him from the mongrel classes referred to. In doing this, we need not be unjust to the cocker, as the "modern field spaniel," which breeders are advancing to a distinct and useful family, nor to the other varieties of the spaniel that have to a great extent preserved their family identity. Our aim, if I understand the sentiments of all who have corresponded with me, is to restore to the cocker his true type, and isolate him from the other varieties to which he has given both character and prestige. This should bring all true lovers of the cocker together, and can have no deleterious effect upon the celebrated "Blossie." Now, if I am one of many, on the contrary, it will tend to purify and improve all classes of spaniels, and break up the confusion that exists at present out of this chaos of spaniels. All the types will become more pure, and the cocker will be interested in the preservation of his own strain.—SEXES.

### ESSEX COUNTY HUNT—SPRING MEETS.—Wednesday,

March 21, 7 A. M., at the kennels; Saturday, March 24, 4 P. M., Mansion House, Montclair; Wednesday, March 28, 7:30 A. M., Glenridge (late Ridgewood Station); Saturday, March 31, 7:30 A. M., Glenridge. Entries for the Derby close July 1. For the Stakes, close Oct. 15. For the All-England, close Nov. 1. W. A. Croser, Secretary, Flatfish, Long Island, N. Y.

Water Works, East Orange; Saturday, April 7, 1:30 P. M., residence A. F. Brown, Esq., Gates avenue, Montclair; Wednesday, April 11, 7:30 A. M., main entrance, Glenridge Park; Saturday, April 14, 7:30 A. M., Glenridge. Entries for the Derby close July 1. For the Stakes, close Oct. 15. For the All-England, close Nov. 1. W. A. Croser, Secretary, Flatfish, Long Island, N. Y.

For the accommodation of parties coming out from the city, arrangements have been made with the N. Y. & G. L. R. R. (Orange branch), to provide loungers for transporting luggage on regular passenger trains on meet days. CHAS. A. HECKSCHER, Master.

### MERIDEN BENCH SHOW OF 1884.—Meriden, Conn., March 27.

*Editor Forest and Stream.*—The annual meeting of the Meriden Poultry Association held last evening, the following officers were elected for the ensuing year: President, L. E. Coe; First Vice-President, Chas. S. Slater; Second Vice-President, F. Stevenson; Cor. Corresponding Secretary, Joshua Slater; Recording Secretary, W. H. Sargent; Treasurer, Wm. B. H. Bates; Executive Committee, D. S. Marchant, A. G. Birdsey, J. F. Ives, P. J. Quigley; Superintendent of dogs, W. E. Miller. It was voted to hold our next annual exhibition of poultry and dogs in this city January 1, 2, 3, and 4, 1884.—JOSHUA SLATER, Cor. Secretary.

VALUABLE DOGS FOR SALE.—Major G. R. Watkins, who will soon visit New York upon business, offers his valuable setters Tom, Crook and Captain Dorset for sale. They will be exhibited at the Pittsburgh Show in care of Mr. E. S. Wamaker, who trained them. Tom and Crook have appeared so often in the columns of the Forest and Stream, that I shall not describe them. Captain Dorset is a very handsome blue belton nearly two years old. He is pronounced by Mr. Wamaker to be a capital finder and thoroughly trained. All are well bred and should readily find purchasers.

BEEF FLOUR FOR DOGS.—Having received a number of inquiries regarding the value of "beef flour" as food for dogs, we have consulted with many who have used it, and find that all speak of it highly of it. We were favorably impressed with it when we first saw it, and are pleased to learn that it has stood the test, as it supplies a want long felt among sportsmen for something of the kind that would enable us to properly care for our dogs when out on their shooting excursions. Messrs. Von Lengerke & Detmold inform us that it is meeting with a good sale.

DOMINION OF CANADA KENNEL CLUB.—The second annual general meeting of the shareholders will be held in the city of Ottawa, on Tuesday, the 27th day of March, 1883, for the election of officers and directors for the ensuing year, and the transaction of other business.—B. H. G. VICARS, Secretary-Treasurer.

### "VETERAN FOX-HUNTERS."—Charlottetown, P. E. I.,

March 7.—*Editor Forest and Stream.*—From childhood I have regarded Sauson as the champion fox-hunter. His daily departs for the hills, and he has been to Uncle George of Connecticut, who saw Sauson's 200 foxes and went 600 better.—D. L.

A NOTABLE CANINE VISITOR.—We received a call on Monday from the pure Laverack setter bitch Meg Merillies, owned by Mr. H. F. Grant, Newport, Isle of Wight, England, who sends her regards to this issue of the Forest and Stream, and her to Mr. Jas. H. Goodsell's Prince. Meg is litter sick to Mr. Goodsell's Don Juan. She is a racy-looking, handsome animal and is exceedingly well put together. The progeny from this union should be very fine.

THE PHILADELPHIA KENNEL CLUB.—We understand that there is a movement upon the part of a number of the sportsmen of Philadelphia to reinvigorate the Philadelphia Kennel Club. We trust that the effort will prove successful, and that we shall soon see the association assert its rightful place and again become a "power in the land."

THE HORNELL SPANIEL CLUB.—*Editor Forest and Stream.* I have purchased the interest of the associate members of the Hornell Spaniel Club, and am now sole proprietor. I propose to devote my time to breeding, and shall only exhibit occasionally.—J. OTIS FELLOWS (Hornellville, N. Y., March 15).

SAN FRANCISCO is to have a bench show next month.

### KENNEL MANAGEMENT.

287 No Notice Taken of Anonymous Correspondents.

SCREIBER, Boston, Mass.—This is not a rare occurrence; we know of no remedy.

C. H. B.—Your description not full enough; may be the result of distemper. Show him to some medical friend.

G. E. M., Charleston, S. C.—Give three grains iodine of potassium in four times daily for three or four days.

J. H. C., Worcester, Mass.—Your description is vague. The color of the eye may be due to cataract, in which case a cure can only be effected by an operation. Show him to an experienced oculist.

J. L. Pale, Nien.—Your description of symptoms is rather indistinct. He may have rheumatism, or a cold, or a fever, or a salivary gland of some of the three glands for three days, and write us if no improvement takes place.

C. H. B., Brighton, Ill.—Your dog is undoubtedly troubled with epilepsy, which may be caused by debility, nervousness, or by over-exercising just after feeding. Remove the cause and you will probably find the epilepsy disappear from the other troubles.

H. S. Jordan, N. Y.—Your account is not clear; for you say that the howls are all right and regular, yet state that the passages are very hard and small. Clear the bowels with a dose of rhubarb in a teaspoonful of water. Feed him on good quality of Hebra's white dicalcium oatmeal daily, and report again to us.

Inquirer, Baltimore.—My setter puppy had a touch of the distemper about four months ago. Since then he has had a slobbering nose, and is very nervous, and he has been very nervous and sounds. What treatment would be best to cure him? He is eight months old and very well grown. Ans.—Look to the condition of his teeth. If he is otherwise well, let him outgrow the slobbering tendency.

C. H. B., Bogota, Canada.—I, my hound dog, seven years old, is paralyzed in the hind quarters, and cannot walk, and he is very nervous. What is a sleuth-hound? Ans. 1. It is impossible for us to say what caused this paralysis, or to prescribe for it without a minute description of the symptoms and condition of the animal. 2. It is a hound that follows the track of game by the scent. The term is generally understood to refer to the bloodhound.

F. B., Falls Village.—I have a young English dog that about eight months ago was taken with the distemper, and it left him twitching his legs. Some say he has the St. Anthony dance, and will never get over it. Can he be cured or not? Ans. A chorea following distemper is rarely cured. See article on Chorea in CHRONIC DISTEMPER AND STREAM Oct. 29, 1878, where treatment, etc., is given. Chorea and St. Anthony's or St. Vitus's dance are the same.

Patience, Pa.—The teeth of a dog are affected by some kind of caries, the enamel of almost all the front teeth being destroyed in circles, extending round them. The teeth are yellow, and the gums are inflamed, and he is in a good condition otherwise, excepting constipation. His food consists of meat, beef, and milk sometimes warm. Ans. The condition of the teeth is probably the cause of the trouble. It is best to be done except good feeding. Keep bowls free by diet of cornmeal mush, or a meal of raw liver when necessary.

Dick, Honeoye Falls, N. Y.—About four weeks ago a small cocker spaniel puppy was taken with the distemper, and it left him twitching his legs. Some say he has the St. Anthony dance, and will never get over it. Can he be cured or not? Ans. A chorea following distemper is rarely cured. See article on Chorea in CHRONIC DISTEMPER AND STREAM Oct. 29, 1878, where treatment, etc., is given. Chorea and St. Anthony's or St. Vitus's dance are the same.

### KENNEL NOTES.

NOTICE TO CORRESPONDENTS.

Kennel notes are inserted in this column free of charge. To insure publication of notes, correspondents MUST GIVE the following particulars of each animal:

1. Color.
2. Name and residence of owner.
3. Sex.
4. Buyer or seller.
5. Age.
6. Sire, with his sire and dam.
7. Date of birth, of breeding or of sale.
8. Date of death.
9. Owner of dam.
10. Owner of dam.

All names must be fully written. Communication on one side of paper only, and signed with writer's name.

### NAMES CLAIMED.

287 See instructions at head of this column.

Cashie M. Chace, By Mr. Herbert Smith, Philadelphia, Pa., for red Irish setter bitch, whelped Feb. 15, 1882, by champion Berkley out of Nora (Elcho—Firefly).

### BRED.

**Kynoch's Patent "Perfect" Brass Shells**

MANUFACTURED BY

**Kynoch & Co., Birmingham, Eng.**

These shells are made of extra fine thin pliable metal, with reinforced base. Use either Winchester or Wesson primers. Can be reloaded as often as any of the thicker makes. Cost only about half as much. Weigh less than paper shells, and in consideration of their reloading and other advantages, are really cheaper than the paper. They also shoot stronger and closer, and can be loaded heavier, as inside diameter is nearly two gauges larger. They possess a great advantage over all other brass shells, as owing to the thin metal they can be closed (as represented in cut) by simple use of the thumb or fingers, and straighten out to original shape when discharged. These goods have already gained a wide and favorable reputation in Europe, and in the opinion of many prominent sportsmen will soon supersede to a great extent the old style of both brass and paper. Samples will, upon application, be mailed (without charge) to any sportsmen's club or dealer, and prices quoted to the trade only. For sale in any quantity by gun dealers generally, or in case lots only (2,000 shells) by

With its compact type and in its permanently enlarged form of twenty-eight pages this journal furnishes each week a larger amount of first-class matter relating to angling, shooting, the kennel, and kindred subjects than is contained in all other American publications put together.

## THE NEED OF RANGE DATA.

TO revert to a subject on which the FOREST AND STREAM has before thought it necessary to speak, we would ask why it is not possible for our rifle associations to take more definite and active steps toward making more valuable reports upon the work accomplished on the several ranges.

It is not enough to have a mere clerk who can present an accurate copy of the score-sheets. That may be necessary enough for the determination of the prize lists. But that after all is but a small part of the field that should be covered by an association which pretends to be organized for "the encouragement of rifle practice." There is not that steady progress in the development of small arms which there should be met with when so many men give so much of their time to practice before the butts. Every shot fired is an atom of experience which it should be the endeavor of the controlling body to gather up for the use and guidance of succeeding riflemen.

It is not enough to say that this work of experiment and carefully noted trial will be carried on by private individuals or by rifle-making firms interested in securing good results. The best results cannot be reached in this way, and the trial of a decade shows that they are not. What are needed most just now are carefully conducted series of shooting trials, so that the rifleman going out to practice may know at least in what direction he may expect fruitful returns for his effort, and what he may not expect to find in other directions. The association will be able to make impartial trials, and the conclusions, whatever they may be, will be accepted on all sides as conclusive at least for the time being. By exploding many old and antiquated notions which still cling about the theory and art of gun and rifle shooting, the way will be cleared for progress in the right direction toward simplicity of mechanism and accuracy of result.

For example the amount of shooting which during

the past ten years has been done in different parts of this State by the members of the National Guard. Have any general conclusions been drawn from that practice? Has there been any compilation of results in such form that succeeding officials may find a fund of information awaiting them, drawn from the rich mine which the annual practice of nearly twenty thousand men opens? There are an abundance of figures, but they are useless records of what was accomplished by the hap-hazard system in vogue.

A small club devoting itself to this line of original research and test can do more for the advancement of the art of rifle-shooting than the richest and most extensive organization which aims only at merely gathering a number of shooters together to compete for prizes. The work now done is an important one. There must be grand field days, when in open matches opportunity is given for a careful and keen comparison of results. In this way different experimenters are enabled to air their theories and get the knock-down quietus of defeat or the encouraging indorsement of victory. But there are dozens of needed tests—of charges, of shells, of rifling, of holding, of powders, of wads, of bullets, of all the hundred et ceteras which enter into that most complex of results—a well-delivered bulleseye. Such a series of tests should run over an entire season in order to gain the advantages of varying weather conditions; and when carried out by different individuals they include that personal equation without which factor tests are apt to become mere bench trials, and correspondingly misleading.

## THE MAINE INDICTMENTS.

IN our issue of August 10, 1882, we called attention to the summer killing of moose in Maine by three parties who we stated were residents of Worcester. One of the three who were thus named, subsequently called at this office and explained—that the other two did not live in Worcester—which was certainly much to the credit of the sportsmen of that city. We do not know just how much more he had intended to explain, but we convinced him that we "had the papers" for our statements; which did away with the necessity of further explanation. By reference to our "Game Bag and Gun" columns, it will be learned that indictments have been found by the Grand Jury of Somerset county, Me., against the other two of the party named, as well as against their guide, for the very offense reported by us. Many other individuals have been indicted on similar charges, and the public is now given to understand that Messrs. Stilwell and Stanley, the Maine Game Commissioners, "mean business."

In addition to the parties against whom indictments have been presented, were many other offenders against the Maine game laws, who eagerly accepted the Commissioners' offer to allow a private settlement, and paid up their fines. We are glad that the detectives failed to discover evidence that the Hon. George F. Hoar, of Worcester, Mass., was present at the moose killing which has been somewhat freely coupled with his name during the past months. The publication of the names, given elsewhere, of which we have been in possession some time, will also relieve from worry several other gentlemen who have been quite oppressed by the thought that their good name might be tarnished by unfounded suspicions.

It is a pleasure to know that there is a gradual change of sentiment among sportsmen tourists, and this change is very largely due to the influence exerted by right-thinking men who annually carry their home principles with them into the woods. Among the Maine summer visitors are many individuals who have by persistent preaching and consistent living exerted an influence in behalf of respect for the game laws. Wholesale condemnation of Maine tourists is, therefore, most unjust.

THE GAME PROTECTORS.—We understand that the bill to increase the force of game protectors in this State to sixteen has been passed. The new law will put the wardens under the control of the Fish Commission, and there may be some possibility of making them do their duty. We have been unable to learn that any of the eight wardens, always excepting Mr. Dodge, have earned their salary, or a tithe of it. They have been unprofitable servants, and ought to be cast out of office. We hope to see Mr. Dodge reappointed, for he has proved himself to be an admirable man for the place, and if the fifteen others were like him game protection would mean something in this State. Special care should be taken in the appointment of these game wardens to supply officers at points where they are most needed. Long Island should not be neglected, nor the New York markets.

## TROUT DAY.

THE legal opening of the trout season in the State of New York is the first day of April, which this year falls on Sunday. While many of the northern lakes and streams are still ice-bound, the streams of Long Island have been free of ice for a month, and the trout are feeding to make up for lost time. How many anglers from the city will visit the island it would be hard to say. The new penal code makes it an offense to fish on Sunday, and we hope that all our readers will strictly observe the law and wait until Monday morning.

Those who are fortunate enough to have friends who own preserved streams and are in possession of invitations to fish them are mortals to be envied. We have several such invitations but cannot accept them for a week or two yet, and it is this fact that disturbs our sleep and makes us thin of flesh. Long Island is the greatest trout country in the State. Its waters have always been filled with trout by reason of their coolness and their plentiful supply of food. To-day there are nearly two hundred private ponds and streams which afford excellent fishing, and also a few streams which have been open to the public for years, and are not yet fished out. The famous South Side Club has been adding to its preserves several new streams, which will be stocked from the abundant supply in ponds and lakes belonging to the club. Its members comprise some of the most prominent citizens of New York. Near Yaphank, the Suffolk Club has its grounds and its excellent fishing. Mr. Austin Corbin's, near Babylon, are well known, and here and at the ponds of Mr. W. Floyd Jones, at South Oyster Bay, President Arthur occasionally wets his fly. At Green River, near Sayville, are the preserves of Messrs. E. R. Wilbur and Charles F. Imbrie, which afford some wild trout fishing.

Beside these places where only invited guests may fish, there are other preserved waters where the angler may cast by paying for the privilege, usually about a dollar a pound for fish taken. There are Thompson's pond, at Noyac, near Sag Harbor; Chapman's pond, at Roslyn; Seaman's, near Ridgewood; Carman's, at Amityville; Furman's, at Maspeth; Douglass's, at Huntington, and others.

The charge of a dollar a pound is certainly very reasonable and is less expensive than to go miles by railroad where the fishing is free. Of free fishing on the island there is little or none that is good. A few trout may be taken from Cedar Brook, near Baldwinville, the *Brookline* at Smithtown, and in the streams at *Brookline* and *Brookline* Cove, but they do not yield in quantity and quality the number of rods and the ease with which they are taken in streams before the opening of the season.

## CAVIAR.

THERE are many people who pretend to like caviar, and it is possible that a few may have forced themselves to relish the intensely salt or rancid preparation of sturgeon eggs called by this name. We believe the "delicacy" first came from Russia, and we can imagine that a native of Siberia, half Indian and half Esquimaux, might find caviar a delightful change from whale's blubber and decayed seal. We have tasted caviar, and think that old rusty mackerel brine is nectar beside it.

The Germans pretend to love caviar, and Americans who have been abroad at it before their friends to show their acquired taste contracted in foreign lands. We read in the *Deutsche Fischerzeitung* that some Germans have been making caviar from the eggs of the pike, and we wish them success in their search after a new source of supply of delicacies. Shakespeare speaks of something which the general public cannot relish as being "caviar to the general." The bard is correct, as usual. Caviar is caviar, whether made of triple-salted rancid sturgeon eggs or of the ova of the pike flavored with seal blubber and stale mackerel brine.

To our friends who have not yet met this luxury we will say that at dinner, after the pudding, ice cream, cheese, nuts, figs and raisins have passed, you take a piece of toast about three inches square and cover it with a quarter-inch layer of something that looks like broken rice stewed in coal tar. On this you put a thick layer of finely-chopped raw onion and squeeze lemon over it. You raise it to your lips; you bite into it and roll your eyes heavenward and declare that you never tasted anything half so delicious before. At the first opportunity you slip down-stairs and take a quiet drink out of the kerosene can to get up a proper after-taste in your mouth.

Yes, the Germans have discovered a new source of caviar

in the pike, and don't we wish we had some of it. The memory of the caviar we have eaten comes over us like the recollections of an Arctic explorer when he thinks of the train oil he has swallowed.

#### THE MINNESOTA MOVEMENT.

THE sportsmen of Minnesota have become thoroughly aroused on the important subject of a more efficient conservation of their game supply, and have set about securing a better order of things. After a protracted struggle in the State Legislature they have succeeded in securing several amendments to the game laws, among the most important of which is a non-export clause, so worded that it is thought to be capable of standing the severest test in the courts. This law will provide a much-needed remedy for the traffic in game illegally killed out of season and shipped to Chicago markets, where the dealers are always willing to receive it, however unlawful may have been its capture. The sportsmen of Minnesota have expressed their determination to secure a stringent enforcement of the non-export law, and it is stated that the principal game dealers of the State will second their efforts.

The work of the game protectors will not, however, be confined to suppression of the illicit traffic in game. The Minnesota Sportsmen's Association, through its active and efficient secretary, Mr. W. S. Timberlake, has given notice that its members and agents throughout the State will report all violations of the game law, and the association's officers and counsel will prosecute the offenders in every instance.

We sincerely trust that the zeal of the gentlemen now interested may not abate; the need of well directed and persistent effort is great. All right-minded sportsmen, whether residents or non-residents, will indorse the present movement.

There has been in certain quarters a tendency to decry non-export game laws as wholly unconstitutional, but this criticism has come from a source which is not altogether above suspicion of being hampered by entangling alliances with the game dealers, and such opinions must consequently be taken for what they are worth, and no more.

**FISHING AND SHOOTING ON SUNDAY.**—The new Penal Code of New York, Section 265, prohibits "shooting, fishing, playing, horse-racing, gaming," etc., on Sunday. This was amended in the State Senate last week so that fishing is exempted from the forbidden pleasures; but an effort to also permit shooting and hunting failed. We have not at hand a record of the votes cast on this occasion, but it is probable that the city members of the Senate voted in favor of Sunday fishing, for the bait and hand-line fishermen of this city are numerous enough to be a power at the ballot-box; and a queer lot they are, too, but quiet and inoffensive. There is a very good reason why shooting should be prohibited on the Sabbath; for if it were not, there would be no peace for the dwellers in the vicinity of our large cities. The Sunday shooters would inaugurate a reign of terror, and the familiar feathered denizen of the Long Island bayward would become a *rara avis* in the land. Some of the other States need laws prohibiting Sunday shooting.

**SOME PICTURES.**—Mr. Charles Lauman, of Washington, the well-known traveler, author and artist, has completed a series of paintings of scenes on famous Canadian salmon rivers. Mr. Lauman's work is of a very high order of merit; his pictures are admirable, and fortunate will be the man who secures them. Mr. Charles Zimmerman, of St. Paul, Minn., who some years ago made a happy hit with his pictures, "The Tight Shell" and "Trying for a Double," has added to the series of duck-shooting scenes three other water-colors, "A Lost Opportunity," "Stopping an Incoming," and "A Side Shot." The pictures are well conceived and most happily executed; they will appeal at once to the duck-shooter, and cannot fail to add very greatly to Mr. Zimmerman's already pleasant reputation as a sportsman-artist.

**ALASKA.**—We are in receipt of the report of Captain L. A. Beardslee, U. S. Navy, relative to Alaskan affairs during his command of that Territory, on board the U. S. S. Jamestown. Capt. Beardslee justly won great credit for the admirable way in which he governed the Territory; and we are pleased to know that the wisdom of his course was appreciated at Washington. Our readers, who will recall the delightful letters from Alaska, contributed by Capt. Beardslee to the *FOREST AND STREAM*, will be interested in a perusal of the present report.

**"AMERICAN KENNEL REGISTER."**—The announcement in our last issue has already brought in numerous responses, which signify the welcome to be accorded to the *American Kennel Register*. The initial number will be issued April 10, and all entries for it must be in hand by next Friday at the latest. We give details of the *Register* in our Kennel columns.

**BIRDS OF MAINE.**—The publication of Mr. Smith's notes, which has been interrupted by Judge Caton's very entertaining "Salmagundi," will be resumed in our next issue.

## The Sportsman Tourist.

### NIMROD IN THE NORTH.

BY LIEUT. FREDK. SCHWATKA, U. S. ARMY.

**V.—Nimrod with a Fish-rod.—Concluded.**  
CODFISH of several varieties swarm over the various parts of the Arctic shores, no less than a quarter of a million being caught annually in Greenland alone. There is the larger variety similar to those on the "banks" of Newfoundland and elsewhere, but are only caught on the banks of the Arctic seas during the summer with hook and line. The smaller cod, the *qoqark* of the Esquimaux, seems to be a more Arctic fish. My first personal contact with this variety was when I first encountered the Nestsahlluk of King William's Land in a little cove on the Adelaide Peninsula. A short distance out on the ice of this cove were a number of holes dug through the ice, some fifteen or twenty, and at nearly every hole was a woman or child hauling out these herring-like cod as fast as they could put in their lines and pull them out. Their lines were made of the sinew stripped from the superficial dorsal muscles of the reindeer, their hooks being simply twisted bits of metal, barbs, and depending upon the rapid hauling in of the line to retain the fish, a dexterity which they acquire to such a degree that they lose but few. Still, our barbed hooks excited their curiosity and desire so that they were fain to give us almost anything for them, but we were glad enough to exchange them for their rough ones of copper that had been crudely hammered from the sheeting stripped from the bottoms of Sir John Franklin's ships, and keep these as mementoes of that deplorable disaster. Whenever the wind would blow with a disagreeable strength the fishers would build a high snow wall on that side to protect them, and this could be varied in a minute or so to suit every varying gust of wind. Even the many dogs in sneaking around would make out to steal a good meal of fish in the course of the day.

One thought could not help impress itself upon me very forcibly. Right near this place was the spot where the last survivors of Sir John Franklin's ill-fated expedition perished from cold, hunger and scurvy, the terrible tripod of death that determined their destruction. Here they landed, some ten or fifteen in number, in the summer months, when the first cause was at its minimum, with the means of appeasing the constant gnawing of the frost, swimming in countless numbers under the very keel of their boat, and using the same being the means of curing the last in the near future. Man's life hangs on a thread, as the old proverb says, for it certainly hung on a fish-line in this case. The old women of the village pressed around us with their hands full of curious little pearl buttons that came from the head of the *qoqark*, wishing to trade them for needles and such material. There is also a small and snail-like fish, called *halibut* in the Arctic seas, caught by whites and natives. The large halibut often weigh a hundred pounds, and a few years ago some American ships went into the business of catching them on a commercial speculation, but I think it has failed. The little halibut is much fatter and sweeter, and is angled for in the ice-floors of Greenland, at depths of about 200 to 250 fathoms of water. In somewhat shallower water of the same places, as from 150 to 200 fathoms, the anglers will often obtain the "red fish," whose flesh is likewise rich in oil and good to the taste. The *nepiok*, a fat little finny fellow, runs inshore during the spring to spawn, and then those natives lucky enough to be in the course of their "run" can live off of them for a couple of weeks or more.

The northern capelin is a fish that warms the unsportsmanlike soul of the native from its great abundance, when it does come, "and may in a dried state in winter time," says Dr. Rink, frequently be said to have constituted the daily bread of the natives. They are actually shoveled on shore for a month during the running season in the spring by the help of nets and seines and strewn over the rocks of the beach like manure over a field. The natives of Greenland do not catch much less than a thousand tons per year, especially if the season be successful.

There is one tribe of Esquimaux, and only one tribe, that my journeys brought me in contact with, who may be said to live upon fish, or, at least, it is their principal diet. I refer to the *Qoo-que-sik* Saalik Esquimaux, who live on the largest branch of Back's Great Fish River, the *Aqoo-ni-gook*, about forty miles from its mouth, and at the Dangerous Rapids at the mouth of Back's River. At the former place, on the *Aqoo-ni-gook*, there is a long series of rapids in the river, and when the ice breaks up and is clear of the river, about July the salmon commence to ascend, and they are speared by the hundreds by the fishermen, who boldly wade through the rushing torrent until a good standing place is found.

Their fishing spears are about ten to twelve feet long, in the inch and a half shaft, and at the lower end is placed a sharpened spike about four inches in length, generally made of copper. Two flaring pieces of horn are bound to the shaft, and at each one of the free extremities of these pieces is a metal spike bent back like a barb, the points of the three spikes nearly touching and at about equal angular distances from each other. When thrust over a salmon in the water the central spike pierces his back, the two outer ones flaring over his sides until they are pulled up, when the elasticity of the snail-ox horns springs drive them over his sides, and the "trammel" on the two pits that hold him with deadly certainty until he is thrown upon the land. The women and children then clean them, and they are placed to dry on double rows of reindeer sinew strings, drawn from one rock to another and back. When dried it is packed in sealskin bags for winter use, and even as late as May, when we visited them, they had a tolerable supply of *pipsce*, as they call it, among them.

Those at the Dangerous Rapids, beside the salmon, catch a herring-like fish which they call *coe-re-sit-luk*, and as it comes later in the year they have no time to dry it, and pile or *cuhe* it away in pens of rocks looking like huge granite beehives often as high as they can reach. Late as they are caught, they have plenty of time to acquire that taint so characteristic of stale fish, and so much is this killed by freezing, and is so generous as to liberate by thawing that the rot is even less decidedly a luxury as a delicacy compared with those that are cooked. This is true of all tainted meats, vast quantities of which are devoured by the natives throughout these regions. Taken in large quantities sickness supervenes, accompanied by a practical nausea, and cases often occur of death from this cause when driven to it by necessity, or indulging in it too freely under other circumstances. Out of 4,770 deaths among the Esquimaux of Greenland, 36 were poisoned by putrid meat, 16 of putrid

fever, probably brought on by this cause, and 73 of complaints of the stomach, 33 of vomiting, of which over half could be of this cause, if my experience among them should hold good in that country.

Colonel Gilder was fain to compare tainted walrus meat to Limburger cheese, and certainly when meats so perfectly marbled with interstitial fat as that of the walrus are tainted it is more that of the rancidity of old cheese than a true putrefaction; but no such claims rest with any of the true Eskimo, even in the cold zones of the Arctic, although we must be careful to have due to this diet in homeopathic doses. In small shallow streams these natives select a large stone, lay the ripple and build an oblique dam across, open for about a yard on either end and inclining to the axis of the stream at an acute angle as the length of the ripples will allow so as to keep the dam within them. After the *coe-re-sit-luk* have passed up the stream the upper opening is closed and a shoal of fish frighten them on the up stream side of the dam, where they must pass through the lower opening of the stream. This dam is continued along the bank for some distance, if there be one, or the water is directed out into a basin if there is none and in either case the fish are penned into a place so thick they are raked out with a large wooden rake on the bank and from thence deposited in the large cauldrons being drawn through the winter.

But the prince of the polar fish out of him here as in the temperate zones, owing to the ice, which bars such sport for the greater portion of the year. They are caught by means of holes cut through the ice, and the amount of satisfaction derived is about equal to that of pike or pickerel fishing under the same circumstances. Whenever the native traveler goes "into camp," and the water-hole in the bog, he always makes allowance for fishing by making the hole large enough to draw through this icy avenue the largest salmon that may perchance be swimming in that lake. He sometimes gets deceived in this calculation. I was once on the upper surface of seven or eight feet of ice, with a twelve-inch salmon on the under, separated by a ten-inch hole and connected by the strongest kind of sinew line and stout Limerick fish-hook. Our efforts to get together were finally crowned with success by one of the natives, who enlarged the hole in the ice with the chisel. These holes are dug with two instruments, the ice chisel consisting of a bayonet, a mortising chisel, a sword point or such like instrument fastened on the end of a ten or twelve-foot pole about two inches in diameter, and an ice scoop, consisting of a ladle holding about a pint, made of the splayed base of a musk ox's horn fastened on a similar pole. The hole is dug about a foot or eighteen inches in diameter, and about as deep, with the chisel, and its contents removed with the scoop, and this alternating process kept up until the water is reached, which wells up to nearly a level with the upper surface of the ice.

#### A REMINISCENCE OF UTAH.

HAVING seen but very little in the *FOREST AND STREAM* in regard to the game of Utah, it is the purpose of the writer to mention some of the small game that can be found in certain portions of the Territory. While from a strictly scientific standpoint, the matter presented may not be very instructive, the perusal of this article may be the means of obtaining some information regarding the section of the country referred to.

In the northwestern corner of Utah, about thirty-five miles from the Nevada line and twenty-five from the Idaho line, is the Rosebud Mining District, and it was the good fortune (or otherwise) of the writer to spend nearly a year in this camp. It is right on the borders of the "Great American Desert," and close by the old emigrant trail, over which so many poor pilgrims traced their weary way during the great excitement of the Pacific coast, and about as proper is situated in the foot hills of the Goose Creek range of mountains, and the district extends to the Raft River Range.

During the year the writer sojourned in the land of the Mormon, he had plenty of spare time to ramble over the hills and mountains, and so was enabled to gain a very good insight into the ways of the inhabitants, their habits and quadruped. Many very laughable affairs happened in the West, and many strange sights and scenes are always in the memory of those who have dwelt in the mountains. A person meets strange characters, in fact all those one meets are strange, for it is not the common kind that emigrates West. They stay at home and do as their fathers did before the time of the Mormon war, and they are different from his brothers (it may be more utterly worthless), but in camp matter, he is different who strikes out for himself, and wanders forth into the world seeking his fortune by land and sea. And among these men you will find characters that it only needs the hands and brain of a Dickens to make as immortal as the characters to which the great novelist has given life. We of "Rosebud Camp" had our characters, and the course of my rambling notes will tell a few incidents which occurred during my residing in the camp. I will not attempt to enter into any description of the mines or mining of the region, suffice it to say, that as far as the writer knows the camp is at this time deserted, for though there seemed to be plenty of good indications and great quantities of rich float, no one has been able to strike the mother lode or loca, etc., of it was in the fall of the year, when the writer "struck" the "camp," and the morning of what proved to be a very rainy day. After having ridden twenty-five miles on horseback, getting thoroughly damp, to say the least, he spent the night on the floor of an empty building, vainly trying to keep warm with one pair of blankets. It was cold enough to snow, too, so one can imagine that his introduction to the Rosebud was not so pleasant. The next morning the disagreeable things have an ending, and after a month or so I was quite comfortable in a little house of my own, where I had two bed rooms and an office.

My first experience in the way of shooting was the pursuit of what we called "mountain hare." I am at a loss to classify the animal. Baird gives a number of hares that seemingly are identical, and I imagine to any but the naturalist that the same thing. The hare resembles the hare has to do Baird describes as the prairie hare (*Lepus yesteri*) is its taking a white fur in the winter. You will be out in the hills to-day, and a hare will jump up from beneath a little bush with its suit of gray and dirty white, and at night the snow falls; the next day you start the same hare—and lo and behold! he is white. No doubt the *Alaskan* is not so sudden, but it really seems so; and the transition back to the summer garb is done as quickly. The

are very large, and I have seen some of them whose backs appeared as broad as that of a lamb as they went hopping up the hillside. They frequent the high foothills, and I never found them below the last hills, where the real plain commenced. When started from their form they hop off very awkwardly, as though one leg was in very bad shape; and if not shot at, or but slightly startled, they will stop after going a little way and sit up. By keeping quiet and watching slowly, it is possible to follow them around and to get near enough to shoot. They seem to skulk and dodge, especially when among the low mountain cedars. But start them by shooting at them, or scare them in some way, and then see them go! Their great long ears will flatten out on their backs, and nothing but a streak of white can be seen lying along the ground—and such jumps! I have started them down a hillside, where the snow lay so that their tracks could be seen, and the distance they would cover with one leap was prodigious. For fear, however, that some may say, "That's another Western yarn," I will not venture to name any exact distance.

The hares are not very hard to kill, excepting in the winter, when their coat is very thick, and then it will stop short in certain ways. But one or two shots in the right place will do the work, and I have killed them at quite long distances with No. 5 and No. 6 shot. They are good eaters, and I have seen most rare lard I could take my mind, sally forth and bring in a hare, three, which a Chinaman could stuff and roast, and serve hot. Charley D., the party who boarded the men, would help himself liberally and then remark: "Rabbit is pretty good chuck, if you hear me." I used to think sometime that the men did not agree with him, especially when the price of table board was \$7.50 per week. They probably thought it was too dear eating.

Poor Charley, he needed money badly, and I for my part did not begrudge him what he could make. He had been in the army and came out crippled with rheumatism. He spent a year in bed and got up with his body four inches shorter than when he lay down. His shoulders were all hunched up and his internal organs crowded together. It was with difficulty that he could walk in the rarified air of the camp, and he would have to stop and rest every few feet when climbing the hill near his house. We were only about 7,000 feet up, but Charley was unable to do any hard work and had drifted West to Oregon, then back to Utah. Here he started a little store and boarding house. While the camp lasted he did well, and would have "made his pile" if the thing had not "pettered." From Utah he went to Idaho, and was one of the few who ever made any money on the placer claims on Snake River. He sold out there and went to the Wood River country, and this winter wrote that he had "made his pile" and now was going to make and take care of himself. The next mail brought the news of his death. This is only one of many sad cases—the best years of a man's life thrown away searching for that which he never lives to enjoy. Charley was a good, whole-souled fellow, and many a pleasant trip we have had together. He would mount my pony with his shotgun while I would tramp alongside, and off we would go for the "jacks" on the plain.

Though Charley was nearly a cripple, he was a good shot with rifle, shotgun or pistol, especially with the latter. When he first started camp he was possessed of a little .22-caliber Smith & Wesson revolver, which in that country, as anywhere in the West for that matter, is laughed at as "no good." So the boys used to "devil" Charley about his "pop." One day one of the boys had just purchased a fine black slouch hat of the best quality, and extra large and with a wide brim and seven doings. He was laughing about Charley's pistol and said that he would just as soon let him shoot at him twenty-five yards off. Charley said that "he did not want to shoot at him, but he would bet he could hit his hat." So the fellow put up the hat, thinking at the worst it would only be a hole the size of a pea if it was hit. Charley took aim and fired away. The hat was inspected, and it was found that by chance the ball had just struck the crown along the top where it was creased, cutting a slit as if a knife had ripped it. The hat was then placed on the ground. "The laugh that followed can be imagined, and the poor chap had to buy a new hat and 'set 'em up' for the boys, while Charley afterward was allowed a little peace about his "pop."

The "jacks" that we used to hunt were "jackrabbits"—that is we also called them—whether they were the genuine "Texas hare" (*Lepus collumbus*) I am at a loss to state. Still I think from Baird's description that they are the same, but they were not as large as the mountain hare, nor so good eating, as they lived principally on the white sage, and their flesh tasted at times very strongly. There was a species of sage which was known locally as "rabbit brush," which seemed to be a favorite food; and wherever it was found there the "jacks" would be in abundance. Near Kelton, Utah, on the stage road into Idaho, there is a patch of this brush, and here the ground seemed to be alive with rabbits. I had heard wonderful stories of the number to be seen, but I was inclined to be skeptical. At last I visited the locality and I saw more rabbits in one day than I ever saw before in my life. They would jump up from beneath your feet, in front, to the right, to the left, and all around you, until it seemed as if the whole plain were nothing but jumping, hopping rabbits. No doubt that there are other sections of the West where they are as plenty, but I never saw such a sight before nor since.

It was quite the thing to get up rabbit-shooting parties in Kelton and to go out and kill a wagonload. It was no trick to shoot them there, but where they are less plenty it is good sport, for if a little excited the jack rabbit is anything but slow. The coyote will pick them up, it is said, but I won't touch for it. I know that nothing in the shape of a dog that I ever saw, excepting the greyhound, has any business at all with them. One of the best hunting dogs I ever saw was evidently a cross of several breeds, but he was a great runner for a cur. This dog rejoiced in the name of Quartz, like Mark Twain's "cat," and was a great character. Quartz would follow his master when he went to work, and if the work happened to be near the surface, he would sit and watch the men put in a blast. When the fuse was set on fire, he would retire with the men and wait eagerly for the shot to go off. As the first sound of the blast was heard, he would get right among the falling rocks and dirt, and if the shaft happened to be where the rocks would roll down hill, he would start after them and try to pick them up. Many a narrow escape did Quartz have from falling rocks, but he seemed to bear a charmed life and always just escaped. He would sometimes follow the wagon to town, and on the way would tackle every "jack" that started along the roadside. Sometime the "jack" would take the road,

and then we were treated to as pretty a sight of a "stern chase" as one would care to see. Quartz would just about hold his own for the first hundred yards, then in spite of his most strenuous efforts would begin to "get left." When the rabbit had increased his lead a little more, Quartz would come back, wag his tail, and look at us as if saying, "Didn't I make him run; just wait till next time and then see me catch him." Then he would trot along quietly until the next "jack" got up, when the performance would be repeated. Quartz was ambitious, but he never "got there."

Sometime when I did not care to ramble far with my gun, I would go just back of my cabin into a deep gulch or cañon, and walk slowly up through it, watching sharply for the little cotton-tail rabbit, which inhabited the cracks and crevices in the rocks. These rabbits were evidently the same specified as the gray rabbit (*Lepus sylvaticus*) by Baird, and resembled the rabbit I used to shoot and trap at home in New Jersey when a boy. Though they average smaller, they are better eating than the larger rabbits and hares of the mountains, probably because they feed on other things beside sage. They inhabit rocky places, and though I have seen them on the plains, it was always near rocks or among stones of some kind.

There was still another kind of rabbit that I used to bag occasionally. This was known locally as the "brush rabbit," but I cannot find anything mentioned among the rabbits in the books. I have seen it only once, and I am inclined to think it is not a genuine rabbit. I always found them in the larger sage brush, near water. They lived in burrows. Hair was dark brown, ears short; general appearance that of a small cotton-tail, excepting color and ears. However, I used to shoot them and then help them, so if they are not rabbits, they are at least not a poisonous article, as I live to tell the tale.

Among other kinds of game that frequented the locality was the sage owl (*Nyctaleus arizonensis*). This bird during the fall and winter would come in quite large flocks, and alight on the bare hillsides where nothing but a very small stunted sage brush grew. The leaves of this plant, however, seem to be the chief food of the sage hen. They are not a hard bird to approach, except in very windy weather; still as a general thing a person can not walk right up to them. By keeping out of sight most of the time, so as not to attract their attention, a person can get very close to a flock. I have stood in my cabin door and heard the whistling of the wings of a flock as they flew to some hill a half mile or so away. Taking my gun, which always hung in my room ready for use, I would start for the hill. If the birds were on top of it I would go up some gulch where I could keep partially hidden; but if they were on the side I would go up the opposite side and circle round until I came out to the flock. This was generally easy work, as the hills were all steep and ran up to sharp peaks. The birds would seldom rise until I was within shooting distance. Once in a while, however, I would "get left," and before I got in sight would hear the roaring of their wings as they went off for another hill. A little patience and a good deal of "leg work" would generally get the birds, however. After they were secured they did not amount to much for the table, especially if they were old and the winter nearly gone. They tasted rather good, but I never saw a bird killed early in the fall they were not so good. They will not keep very long, as I learned to my cost. I shipped two East to have them mounted for a scientific society. It was winter and I thought they would go through all right, but they arrived "too ripe" for use.

Up in the pines, some distance back of camp, one could find the blue grouse (*Tetrao obscurus*), but they were not plenty. Over the "cotton-tail creek" side the birds were more than thickly timbered and not as many as there were more plenty. I did not get over the range, therefore my acquaintance with this bird was limited—for I saw very few of them on our side of the mountains.

About four miles from camp at the foot of the main range was the head of a small stream called Rosebud Creek. In the high grass and weeds near the wet ground was quite a resort of the sharp-tailed grouse (*Pedicula phasianus*) or one of their kind. I have seen them in the high grass, where I found away from springs or streams, that is at any distance. They will lie in the grass quietly until kicked up, and at times a person will walk nearly over them. They are not hard to kill, and it is good sport shooting them. Their size compares favorably with that of the partridge of Michigan, though I do not think they will average as large. I used to go over to the creek after grouse, and while there would call on a character who lived in a cabin on its banks. This party was known as "Whisky Bill," "Cock-eyed Bill" or "Preacher Bill." The first two names I could account for, for whisky was a "strong hold" with Bill, and one of his eyes was a little crooked; but the "Preacher" part I cannot explain. This party was a little short man, seemingly shorter than he was, as his head sat right on his shoulders without any neck to speak of. He had been all over the West; was a trapper, stage-driver, pony express rider, miner and I don't know what else. He would come to camp after food and supplies, borrow all the books, papers, etc., he could find, shoulder his gunny sack and tramp back to his lonely cabin, where he would stay all alone for days and sometimes weeks. He was a great reader. One winter when trapping in the Rocky Mountains, he ran out of everything readable excepting an old Bible, which by some strange chance happened to be in the cabin. This he read through twice, and then he was gone. He was a great reader, and was the last man I ever to pick a quarrel or have any trouble with anyone; but he was not afraid of being shot, as was proved by a rather laughable incident that occurred in "town."

One day Bill borrowed a mule and went to town (a railroad station), and there, in due course became gloriously drunk. When it became time for him to go home, he sought the mule and was trying to mount the beast. Just as he called there, "muddled enough," he put his foot on him twice with a revolver, the balls singing very near Bill's ear, but he did not seem to notice the shooting. One of the crowd helped him to board his mule, and he sailed off, colors flying. Whether it took a long time for an idea to work itself through his muddled brain, or whether the ride home sharpened his faculties, no one knows, but the next day Bill appeared in town, still "full," as he had taken a supply of the creature to the point where he had put his foot on him, he hunted for the man who had done the shooting. Rolling up to him in an unsteady way, he began in his peculiar nasal tone with, "Say, look'er Gassy, I want to know who in h—l—er was shootin' at, and yer want to be keeful. If yer want to shoot at me, why all right; ain't any objections. But don't shoot towards that mule agin, for you might hit the mule, and he ain't mine; so mind,

don't do it agin," and off he went, satisfied that if there was any more shooting the borrowed mule would be respected.

Of all the mean, contemptible animals that roam the Western plains and mountains, the coyote (*Canis latrans*) is the meanest. We had a fair supply near and around our camp. Some quiet, "stilly" evening after all had retired and were "sleeping the sleep of the just," a sound would be heard like the wall of a lost spirit, then another like the yell of a maniac, then a succession of hoarse sounds, until it would seem as if pandemonium had broken loose and all the devils, great and small, were holding high carnival over the happy event. A person not acquainted with the character of the beasts would imagine that at least fifty of them were in camp, when three, or at most four, would be the extent of the gang. It was not often that we got a shot at Mr. Coyote. He would always "hob up serenely" when we did not have our guns handy. Charley had a few chickens for a short time, but coyotes love chickens, and Charley's died young. Scraps of meat and anything in the line of eatables were cleaned up nicely by these scavengers, and many other things, which a person would not imagine they would touch would likewise be gobbled.

On clear bright mornings, when the wagon would start for "town," it would not go more than a half a mile from camp, when away off to the right or left would be heard a yell, and in a moment another in reply from some other place. Then the yell would be heard by the right or left, or two away two or more coyotes would be following it to pick up the excrement dropped by the horses. We had a good joke on my brother while he was with us. One day he went to "town," with Charley after a load of supplies; and they did not start to return to camp until nearly night. It was dark before they were home, and as they had a load J. was walking to lighten the pull over a bad place. He felt behind a little way and presently looked behind him. "There, right at my heels, were, as he supposed, two dogs. Charley had stopped to allow J. to catch up, and as the latter reached the wagon, he said: "Whose dogs are these, Charley?" Charley glanced back and burst out: "Dogs! hang it man, those are coyotes." J. climbed on the wagon and rode the rest of the way. Not that he was afraid, but then the roads were good. The wolves had been attracted by the smell of meat, and were following the scent. There was not the same kind of pack as the larger animals, and even now, I suppose that these accounts are true, at least I have no good reason to doubt them; but I personally never saw more than three or four coyotes together at one time, and they were anything but bold. Dogs and coyotes will interbreed and some of the dogs that follow the Shoshone Indians around can hardly be distinguished from coyotes. They are a hungry, sneaking, mean-looking lot.

There were a few more of these creatures near camp, but it was not until we had caught sight of one; and I only succeeded in getting a shot once, and then the distance was too great for the fine shot used. They were the prairie foxes (*Vulpes intermontis*), and they are a beautiful animal. A description of the game of our camp would be incomplete did I fail to mention the animal known as the mule. Many may think a mule queer game, but I can assure them there is much game in a mule; and though plenty of game is made out of the festive mule, there is much more to be made. It is a subject without limit, for "y'en, verily," no man can comprehend the vagaries of the mule's character, especially of the Western mule. I believe that the further West one travels the more muleish he finds the mule. Here is a little incident to illustrate this point: We had hired a man to haul some lumber, etc., from the C. P. R. R. to camp. His team consisted of six animals—three horses and three mules. The freighter, a patiently straightened thing, and hit Moll a cut with his backspoke. Then he stepped back, and yelled this time directly at the obstinate one, "Stand up, Moll." But Moll shook her head as if to say "couldn't think of it," and stood still. P.—the freighter—then walked up, and with the butt of his whip gave Moll a fine training, but it was of no use, so he would not, I stood watching the proceedings, wondering what would come next. I unhooked the harness (Moll meantime standing like a lamb and looking as innocent as a baby), and getting a large lash rope from the wagon fastened it to Moll's neck; and after leading her quietly to the rear of the heavy wagon, he tied her head down as near the wheel as he could. Then he took off his coat and vest, laid down his hat and threw his braces back. Walking to the woodpile he picked out a club about five feet long, and with the head as a mallet, he walked up to his head that mule for fully five minutes. Then he took her back, and put her in the harness; and she—pulled—no, sir, not much! Out she came again, and once more back to the wheel. Some more medicine. To vary the dose this time, the butt of the heavy backspoke was applied over her head; this seemed to have some effect, as she began to hang her head and shake it. Putting the harness to her once more, P. stepped back, put on the braces, a yellowed vest, and then, after a short wait, started off with wagon, team and brakes set, too. P. stopped the team after driving around a little and came and put on his clothes. "There," said he, "that mule has been aching for that for six months, and I have drenched the job, now she is all right for six months more." Well, thought I, that beats me, as it did the mule.

The mule is tough. It lives on stuff that would kill a horse. There was one old mule that would eat anything on the prairie, and he lived in the kitchen. He would stand in the lee of the building in a raging snow storm and chew a ham bone as a dog; and in the spring that mule came out in good shape. Some may think that the yarn is as tough as the mule, but I can assure them that I myself saw the beast.

One more strange thing, strange at least to the "fender-foot," is the language of the Pacific coast. All west of the

trout, if we do, and beside, families get so scattered there that no one knows who his father is, and so vice versa, and who knows but that it is such delicate food that makes them so toothsome a dish for us. If Patti can improve her voice by singing on the mountainsides, why may not a trout improve his flavor by eating on the rocks, and vice versa?

"Well, the fond mammas, knowing the danger, keep the youngsters down the stream, where there are so many good hiding places, till they get large enough to take care of themselves, or it may be, to help themselves to a younger brother, when they go off on voyages of discovery in large schools of the same age, and bring up in the little lakes. Sometime, no doubt, a little fellow swims trout and messengers off to the lake, but he is soon gobbled up, before he has time to practice on a fly or a baited hook. Now if this explanation don't suit you, then find a better one for yourselves."

But I slid away from the gallinippers onto the brook trout without knowing it. Well, I am glad of it. We had been so long among those horrid massagers, and slab-sided hogs, and the pesky gallinippers, that it made me sick, and I had to go to something beautiful and charming just to settle my stomach. But I don't like those repulsive things, no doubt, though I never could find it out, and it was necessary you should know something of them to qualify you for the greatness before you, if you answer the hopes of your dear mammas, and I'll try to do my share in the discouraging job, even if it does make me sick."

"But, Major," called out a tall gaunt, stripling, who had seemed particularly interested in the trout question, "you started out all right with the prairie chickens and the deer, which I don't call repulsive things, but directly you switched off onto another track, which run you into a nest of vipers, where you floundered along till it made us all shudder with their ugliness. Now, can't you top off where you began and make us feel a little more jolly at the end?"

"Good for you, my darling," responded the Major. "There is some hope for a lad that loves the beautiful in nature and dislikes the ugly, if God did make them all; but I will say this, I always had my doubts about the serpents."

"Yes, yes, let's go back to the prairie chickens and the deer, where we began; and I only wish I had time to tell you about the wild turkey, too, whose plumage is the gayest, glitters with the softest and the most charming colors, exquisitely blended, of all American birds, not even excepting the humming bird. I have seen hundreds of them in a flock within a few miles of where we are now. In the spring the old birds start about, and raise their feathers till they looked as big as a barrel, and you would think they must burst with pride and self-importance, and you could hear them gobble in a continual chorus full a mile away; and then they would fight. O my! it was the battle of the Wilderness over again, where the Grants and the Lees fought for the mastery. But we must leave them for another time."

The prairie chicken is not a very beautiful bird, but he is good all the same. He is not a smart bird."

I was much troubled with a disease which often afflicts boys, called 'the fowls.' They haven't sense enough to go south to warmer countries in cold winters, but hang around here and freeze and starve to death, when they could fly in a single day to where they could make themselves comfortable. Although they generally make short flights, they can fly for miles at a time if they choose, as I have seen them do."

In cold weather they express themselves by sitting around on fences and trees where the wind can get a fair rake at them, while in warm weather they always sleep on the ground under some big leaf on the prairie where they can't get a breath of fresh air, and where all the varmints in the country can easily find them. They always make their nests on the ground, where the snakes and such are hunting for them, and if a nest escapes them it may be drowned out by the floods, for they are to select a dry ground for their nesting places. In very wet seasons the species of birds expect a short crop of chickens. If they would only select safe nesting places, like the crow or the blue jay they would multiply faster than rabbits, for they are good layers and good setters, and I never found an addled egg in a nest after the brood had left it. The eggs are small, and the average number set upon may be from twelve to sixteen, but they are exposed to many casualties when very young, but when a pair are ten days old they can fly pretty smartly, and can take some care of themselves."

"These prairie birds are, however, funny fellows, sometime. The spring of the year is the season of courtship with them, and it doesn't last all the year round as it does with humans, and they do it in rather a loud way, too. And instead of taking the evening for it as many people are inclined to do, they take the early morning for it. Early in the morning as soon as it is light you may see them assemble in parties, from a dozen to fifty, together on some high knolls, where the grass is short, and their goings on would make you laugh, it would. The cock birds have a loose patch of naked, yellow skin on each side of the neck just below the head, and above these on either side just where the head joins the neck are a few long black feathers, which ordinarily lay backward on the neck, but which when excited they can pitch straight forward. Those yellow naked patches on either side of the neck cover scales, which they can blow up like a bladder whenever they choose. These are their ornaments, which they display to the best advantage before the gentleman at these love feasts. This they do by blowing up these air sacks till they look like two ripe oranges on each side of the neck, projecting their long black ears right forward, ruffling up all the feathers of the body, till they stand out straight, and dropping their wings to the ground like a turkey cock. Now they look just lovely, as the coy and timid maidens seem to say, as they cast side glances at them, full of admiration and of love."

"Then it is that the proud cock, in order to complete his triumph, will rush forward at his best speed for two or three rods through the midst of the love-sick damsels, pouring out as he goes a booming noise, almost a hoarse roar, only more subdued, which may be heard for at least two miles 'a he still morning air. This heavy booming sound is by no means harsh or unpleasant to the ear, it is soft and even harmonious. When standing in the open prairie at early dawn listening to hundreds of different voices, pitched on different keys, coming from every direction, and from various distances, the listener is rather soothed than excited. If this sound is heavier than the deep key notes of a large organ it is much softer, though vastly more powerful, and may be heard at much greater distance. One who has heard such a concert can never mistake or forget it."

"Every few minutes this display is repeated. It is not only one, but more than twenty cocks going through

this funny operation at once, but then they seem careful not to run against each other, for they have not yet got to the fighting point. After a little while the lady birds begin to show an interest in the proceedings by moving about quickly a few yards at a time, and then standing still a short time. When they see a cock contented with a large number of birds at a time, it presents a funny sight, and you can easily think they are moving to the measure of music."

"The party breaks up when the sun is half an hour high, to be repeated the next morning and every morning for a week or two before all make satisfactory matches. It is toward the latter part of the love season that the fighting takes place among the cocks, probably by two who have fallen in love with the same sweetheart, whose modesty prevents her from selecting between them."

"These birds can't smell enough to tell a roscod from a polecat. I guess their eyesight is pretty fair, and they know just enough to fly when they are badly scared—sometimes. When they do get up they fly straight away with a very rapid motion of the wings and a whirring noise, which will raise every individual hair on your head if they get up near you and you are not expecting it. They are an easy mark for the sportsman and are very welcome to the table."

"They have contrived well. The cock snuffers are used to catch them in box traps and confine them in loose pens made of poles, where they would eat and fatten well, and the hens would lay their eggs in the spring, but were not inclined to set upon and hatch them. I believe they could be easily domesticated with proper management."

"The winter of 1832 was the hardest winter ever known in this country within the memory or tradition of the oldest Indians. The snow was four feet deep all over the north half of this State, and it was the greatest valley. This was very bad for both deer and prairie birds. Not one in a thousand lived to see the naked ground again. In 1833 I marched with my regiment across the Grand Prairie, and we did not start a single head of either. Before the big snow, hundreds, or more of them, would have been started. By 1835 on the same route, many were met with, and in 1838 they were as abundant as ever, and the deer were even more so, for the winter was not so severe. The white settlers only had been here three years, and the Indians were still in the country. In 1839 I counted over sixty in one drove, only sixteen miles from Chicago, and you could cross a prairie nowhere without jumping a deer. The Indians were never hard on the prairie chickens. Not but that they wanted them, but they could not get them in paying quantities. They could not smell them out like a pointer dog, and they never tried to shoot them on the wing, so the birds had it pretty much their own way."

"But the deer! The deer, the most beautiful of all living things—barring the ladies, which I only do for politeness' sake. His graceful form, his light and elastic step, his bounding leaps as he rushes through the forest or over the plain, his mild, bright eye and majestic mien as he stands in the running stream, form a combination of fascinating charms in no other animal brought together. If that aesthetic fellow who has lately been roaming through this country milking the gentle goats, could see one wild deer in his unchecked freedom, he would surely expire with delight or say, 'I will look no further for the beautiful.' How I ever had the heart to kill one of these I cannot tell, and yet I never felt a self-reproach, while I never ceased to admire. Surely we are strange combinations of inconsistencies."

"The deer has some peculiarities which I may mention: In the first place they have no gall sack on the liver. This is true of all the deer family, and so one wild deer is still more remarkable, is that vegetable poisons have no effect upon them. For instance, the deer will grow fat on the evergreen laurel, while a single mouthful will kill a sheep."

"A deer will eat tobacco whenever he can get it, and probably he would grow fat if he could get enough of it. Offer the first tame deer you meet with some tobacco, and you will surely make him your friend. Whether this is so, I cannot tell, but I know, and so you can reckon it is not. I feel very confident that he knows he is not so much afraid of venomous bites, like the hog. He has as great an antipathy against the massager as any good Christian. Any man worthy of the name, even if he is going for a doctor, will stop to kill a massager, and so will a deer. I once saw a grand old buck looping over the prairie, as if he was in a pretty smart hurry, when he stopped suddenly and turned his head to windward. Presently he began stepping along, as carefully as if he was looking out for the tracks where he was careful as if he was looking intently over every foot of ground before him when he stepped."

"I say, Major," cried out a freckled-faced, shock-headed and sandy-haired graceless-looking stripling who had stood for an hour, one bare foot resting on the other, where he had balanced himself with great precision, "did that old buck tell you what doctor he was going for, or what member of his family was sick?"

"The major looked and looked at the impertinent youth for an instant, and said:

"Boys, take that sickly-looking youth home at once and put him to bed with hot bricks to his feet, and ice to his head. He is in great danger and prompt remedies should be applied." It was evident the sympathy of the crowd was with the Major, who had so often interested and instructed them. The boy was hustled out of the ring in a trice, and when all became quiet again the instructor proceeded:

"As I was saying, that deer stopped short in his tracks, turned his head to windward and sniffed the air for half a minute, and then turned in that direction and stepped along very lightly and cautiously, looking intently before him. Now you must know that the deer has not a very sharp eyesight, though his eyes look as if he could look right through a board fence, but his senses of hearing and smelling are sharp enough to make it up, and more too. He can smell an enemy further than he can see him, and he can hear a chicken, and tell what it is, and where it is, and he can hear the breaking of a twig or the rustle of a leaf, at an astonishing distance, and tell by the sound what caused it."

"Presently that buck stopped stock still, and looked into at some object a little way before him, with his neck curved down for a few seconds, and then jumped high in the air and lit about six feet away upon all four feet bunched together, and he looked as if he had run a half mile at least ten feet, and then turned his head to look at the tracks where he had struck. After a short survey he pursued his way as if nothing had happened. I might have shot that deer, but I wouldn't—no, not much, though I was in want of meat bad. I well knew the Christian work he had been doing and felt like shaking hands with him as a brother. I would have starved before hurting a hair of his hide."

"After he had gone on (for the doctor it may be) I went up to see the tracks he had made, and sure enough there lay

the mashed remains of a big massager, which looked as if he had been run through a sausage mill. Those four double hofs, almost as sharp as hay knives, loaded with about 180 pounds of venison, had just cut the thing all to pieces. There wasn't a piece left big enough to wiggle."

"Now, who shall say that a deer hasn't got sense and courage as well as beauty or could spend a whole day in telling you of incidents that would prove it, and if his meat wasn't so toothsome and nourishing I just know it would be a sin to kill him. I never killed one unless I needed the meat, or somebody else did, and when I killed him I loved him still."

"I must write a book book some day just to tell how many ways venison can be cooked, each one better than another. I will only speak of one now which is not mentioned in the latest authorities. Take the spare-rib of a deer, impale it on one end of a sharpened stick, and stick the other end of the stick in the ground, leaning it toward the fire, sprinkling it with a little salt and red pepper, or, in want of these, use clean hickory or maple ashes lightly. Half a dozen of these at the back side of your camp-fire will be ornamental, and in the morning you will find them useful. Go to your cedar or hemlock bows and sleep till an hour before daylight. Then get up and you will just hanker to pick those bones. The deer has a good deal of the first streak of light, listen to the concert of the squirrels and the birds as they awaken to greet the morning light, and if you keep still and look sharp you may see a big-horned buck, or a doe and her fawn, on their morning walk, and now, boys, I think we have said enough for one day, so let's go home and get our dinners and tell your mammas you have been to school."

"Say, Major," called out an intelligent-looking lad, who had been attentively listening in silence the whole time. "Tell about that pilot plant that you sighted to across that valley."

"Well, I will," said the Major, "for it won't take long. There are two plants that grow abundantly on the wild prairies which indicate to the observing traveler the cardinal points, or the points of the compass, unless, indeed, he is completely turned round, when he may take north for south and east for west. Hence these are indifferently called the compass plants or pilot plants. Both are of the sunflower family, and have flowers like it, only smaller. One is also called the rosin or turpentine weed [*Silphium laciniatum*—Ed.], and is the most abundant. While it is met with in the high rolling prairies, it grows most luxuriantly on low ground, where it sometimes occupies the ground to the exclusion of all other plants. It only seeds once in four or five years, when a stout seed stalk shoots up, from four to eight feet high, with a fuzzy coat, with small leaves shooting all around it, except along its course. This stalk is saturated with a gummy fluid strongly resembling the sap of the pine tree in smell and taste. Wherever a stalk is broken or the bark fractured this substance exudes, and as it dries it crystallizes in drops from the size of a shot to that of a half-ounce bullet. It is as clear as amber. The children of the period used to gather it in considerable quantities and used it for chewing gum, for which it is the best known substance. It cleans the teeth and gums, and all impurities and the substance has a pleasant breath and promotes general health. That explains why it was that all the log cabin girls of former days had such beautiful pearly teeth, as white as the snow and as sound as a rootabaga. You can tell one of those log cabin girls by her teeth yet whenever you meet her, and it is all owing to the prairie gum, but remember they could only gather much of it once in four or five years, so they had to lay in a good stock when it did come, when it did come, it was, to say the least, a treasure, it would have commanded a very high price, for what wouldn't a girl give for beautiful teeth, provided she is of any account herself."

"Horses eating prairie hay never have the heaves, and the leaves of the pilot plant, more or less of which is found in all wild upland hay, have the credit of this. The leaves of this plant grow out in a bunch of from five to twenty, close to the ground. They are from an inch to two inches long, with a strong center rib and deeply serrated edges. One is called the fingered-leaf pilot plant. The fingers in the middle of this leaf may be six inches or more long and two inches wide, and the indentations between them reach to within an inch of the center stem. These leaves spring from the roots, which are large and of a soft, woody, fibrous structure. They are readily cut off by the breaking plow, and die at once."

"The other pilot plant [*Silphium terribilitatum*—Ed.] is of the same family, but differs from the first in several particulars. It has a large palmate leaf with finely notched edges. It may be from ten to fourteen inches long and half as wide. It widens gradually from the bottom to one-third its length, and then gradually diminishes in width to a point at the end. It, too, springs from the root, which is smaller than the other. It, too, secretes a resinous substance, but is much less rich than the first. It has the resinous odor, and so no gum is gathered from it. Its bearing years occur more frequently than those of the other resin weeds—a very few of both will be found in fruit every year. Its fruit stem is longer and more slender, and is as smooth and glassy as if finely polished. It is much more tenacious of life and will bear transplanting. It grows on drier ground and not in such dense bodies, but is scattered over the high rolling prairies. Of the first number of the resin weeds, I found clustered together, especially on the higher grounds, sending up a dozen or twenty seed stalks in a cluster, which when in bloom may be seen at a great distance."

"I once took a friend, who had just arrived from the East and was supposed to be far gone with the consumption, out riding. The road passed through a large field of the resin weed in full bloom, and almost as dense as a field of hollyhocks. For some distance the air was loaded with a delightful resinous perfume. Directly after we rode the field, covered all over with a golden mantle above our heads, he drew a long breath, and requested me to stop, saying that he could now breathe freer and fuller than he had for a long time. He seemed to be in positive delight as he freely inhaled that healing atmosphere. Every pleasant day after, I took him to the same place, with the same results. He began to improve immediately, and in a month's time felt so well that he began to look about for business. That was thirty-five years ago, and he has never complained of his lungs since that healing, and is a well man now. That the fragrance of the rosin weed is soothing and healing to weak lungs I am certain, and I have no doubt the same is true of chewing the gum."

"But how about the compass plant of it, Major?" cried out a lad who was evidently becoming impatient at so much detail.

"Yes, and that is the last," said the Major. "It is these clusters of large leaves, springing right from the ground as described, which point the course. Their edges point to the north and south, and their sides face to the east and west. This is not so with all of them, and perhaps not with any of them exactly; so that if you depend upon any single leaf you would surely be misled. This is their condition approximately, and all nearly all varying somewhat to the right or left of the course. But if you error correct, another and take the average, and the true north and south are pointed out exactly. I speak of what I know, for I have often set my compass and studied carefully cluster after cluster of these leaves, and of both kinds, and always with the same result. It is not necessary to study minutely every leaf in order to determine the right course. The moment the eye rests upon a cluster of leaves it almost intuitively calculates the average and determines the course."

"I could tell you some marvellous stories of the results from observing these plants, but I have told enough for one day, and so we will declare school dismissed."

As the Major arose from his seat and turned away he saw me writing on a barn-head just behind him, where I had taken down every word he had said.

"A child's game you rate my notes," said the Major. "It was too good to lose. It was throwing pearls before swine."

"Not so, my friend," rejoined the Major. "There is sure to be some one or more among those boys that has it in him to make his mark in the world, and what I say may whet his appetite to seek for more knowledge. You ask my leave and then do as you like. You are a posy-set after all. If a man has a little wake at night, and then talks in his sleep you will have every word of it in the paper the next morning. At any rate leave out those big things I said in the fore part of my talk. I had to put them in to get the boys' attention."

"No, no, Major," said the reporter, "that would spoil it. These were exaggerations, and so understood by everybody; as when we said a million, we are simply understood to mean a great many." "As high as the sky," we simply mean very high. When you told how you were handicapped by the massagers, you only told that they are very plenty and ugly, and strike at everything that comes within their reach, and either from the form of their fangs or viciousness they are apt to hang on when they do bite. Now this I well know to be true. I once had a pointer dog, who was ranging through the prairie at a good pace, when he suddenly reared up and threw up his head violently, and up went a massager more than four feet into the air. He had bitten the dog in the cheek when he was on the run, and it took a violent jerk to throw him off. And then, too, was proved the efficacy of that rattle-nake weed which did you such good service on that trying occasion. I took in the dog and drove to a cabin about half a mile away, where some of that root which grew within a few feet of the house, bruised it in milk, and drenched the dog with a pint of it, and bound the rest onto the wound as poultice. By this time the head was swollen large enough for two heads, and very soon the dog was in a comatose state, and so continued for ten hours, when I went to bed never expecting to see that dog again alive. When I looked out of the window the next morning I was rejoiced to see the dog making his way to the door, and he never after showed any evil effects from that bite. So you see you were only telling simple truths, though in strong language, no doubt. But, Major, I do think it was rather hard on the boys to have to chew the roots for that big poultice. Certainly if there were any dormlocks about there with which they could have bruised them."

"Not so," said the Major. "By mixing the root with human saliva a deadly virus is added to the bite. You yet to learn that human saliva has wonderful remedial effects in certain conditions, while it is actually poisonous in others. It may be taken into the stomach not only with impunity, but is absolutely essential to the healthy action of that organ, while it is poisonous if taken into the circulation; such is the case also with the virus of a rattlesnake. You may suck the poison from the wound made by the rattlesnake with perfect impunity, if it is taken into the mouth, and indeed that is the best thing to do, if it can be done quickly. Human saliva counteracts or neutralizes other poisons similar to itself. Hence it is that it so quickly relieves the pain of a mosquito bite or even a bee sting. It is an excellent remedy for all cutaneous irritation, and still it is hurtful if it gets into the circulation. I have heard of several cases where most serious consequences have resulted from human bites, and of a virulent pest which is produced by the bite of the Indian microscopists lately tell us that blood globules undergo precisely the same change when brought in contact with human saliva that they do when touched by the virus of the viper. I expect it will not be long before the scientists will prove us all to be only an improved breed of vipers, and that our bites should be equally avoided. I think I have seen people who are not much improved in the breeding either."

"Thank you, Major," I said, "I now see why you made the boys chew that root poultice. As to the gallinipper hairpins, if that was an exaggeration it only amounted to the statement that they have fearful long and stout bills, which is undeniably true. You made them pretty large, to be sure, when you made fish bait of them, but—"

"Stop there," said the Major, "that was true in fact. For Jim Boal did catch a fine yellow perch in Gratiot Lake with one for bait, and we could really have caught a whole mess of them only we would have had to bait the hook every time, which made it too slow for them when they were ready to almost jump out of water at any thing."

"As for that old sow, I admit I made her rather thin when I forced her through a three-inch space, but all that breed were mighty thin and slab-sided. I know I made her a better snipe hunter than they would average, but everybody knows they went for them as if they both hated and loved them."

"I don't know of anything else that I have said that needs any explanation or qualification, so I will bid you a good day, hoping that you may live long and prosper."

**SNOW BENTINGS IN A TREE.**—Not to be outdone by "Taxidermist," in your issue of March 8, I want to report what I have just evened out. I saw a fallow deer in a field of snow, and since then snow bentings have been more plenty than at any time during the winter. Wanting some specimens, I went out on Wednesday, but succeeded in getting only two good ones. After business hours yesterday I went over the same ground and did not see a bird until I

had got inside the city limits, when I saw a flock of fifteen birds, and on getting near them I saw they were horned larks. Not wanting any more, I thought I would see how near I could get to them and watch them. When within about four rods, on looking beyond them I saw a flock of 200 or 300 birds, and as they seemed to be more restless than the larks, I concluded they were buntings. I passed the larks without disturbing them, and when within good gunshot they took wing, and I fired one charge of No. 12 shot among them, killing one and wounding another. After securing them, I saw that the larks had flown about fifteen or twenty rods and alighted again. I retraced my steps to take another look at them, when to my surprise I saw the buntings retook and alighted among them. I shot among them as they got up, killing one lark, one bunting and winging another. The larks flew from me, while the buntings passed by me, crossing the street, and to my great surprise, all alighting in a large elm tree about four rods from the street. After securing the two dead birds, I took after the winged bunting, and before I had overtaken it, it had reached the fence, passing under it into the street. While I was getting over the fence I saw one of the larks alight by the side of the wounded bunting (probably taking it for its mate that I had killed) and then on the rail of the fence, and remained there until I had secured and picked away the bunting. A team passing, it then took wing, and after four rods from me, and I turned away, thinking that I had unnecessarily severed a pair that had come to stay and rear a family; but as there were fifteen in the flock, there must have been one without a mate, and I tried to console myself by thinking that in some respects birds are like human beings. As I passed to the opposite side of the street, and near the tree where the buntings had alighted, two meadow larks flew out of it and over the street, and I shot one, which was the first of the season. I do not know that it is uncommon for snow buntings to alight in trees, but I have never seen or heard of their doing so before. I was much surprised when "Taxidermist" reported the horned lark doing so, but now I do not doubt it.—J. L. D. Lockport, N. Y., March 23).

**MEADOW LARK AS WINTER RESIDENT.**—I read with great pleasure Mr. Enly's chapter on "Our Winter Birds," in your last number, and through your columns would like to ask that gentleman who has been so well noticed the lark as a winter resident. My attention was first attracted to this bird during the winter of '76 and '77, at which time I was teaching school in the Blue Ridge Mountains (Adams county, Pa.). On Christmas-day of that year I went rabbit shooting, and while crossing a rather marshy spot of land flushed a meadow lark, which I killed; and as the report sounded, a woodcock flushed, which I killed with my other barrel. The lark, and likewise the cock, were the heaviest and largest birds of the two species that I ever saw, and oh, we good! such delicate and juicy morsels never crossed any man's palate. While narrating this fact to the stage driver from Gettysburg, I made the remark that though I had read of winter woodcock, I had never seen or heard of a winter meadow lark. This gentleman told me that he knew of several large flocks living the year around in the meadows around Gettysburg. The following winter I was at the Pennsylvania College, teaching school for feeble-minded children at Media, Pa., and here on our own grounds, I saw proof of this fact in two large flocks which remained all that winter with us, becoming very tame during the cold weather; we fed them the whole winter. Just about a month ago, while crossing the fields, in our county and near the city, my young sister flushed a lark, which I have since seen several times in the same field. If my memory serves me, she was the author of the first shot which I have had access, being the lark as a migrating bird, and from the facts stated above I should think differently. Another point, the bird I shot in '76 was a male, which I proved by dissection, and two which I shot from the flocks at Media were also males; this would seem to give strength to the theory I once heard, that it is only the females which migrate. Mind you, Mr. Editor, I am doing no more than write what I have seen or heard, and cannot make a dogmatic assertion one way or the other. I can only hope others will give some observations on the bird which, if not hunted as game, is at least interesting as an ornithological study, and the bird which I have no doubt others beside myself used as a target when taking their first lessons in wing-shooting.—MEDICUS (Baltimore, March 23).

**THE PTARMIGAN WINTER.**—Last autumn (1882) we had published in the Quebec *Chronicle* a letter relative to the probable recurrence of the willow grouse or ptarmigan (*L. albus* Aud.) this winter. The prediction or surmise has proved correct as the following clipping from the Ottawa *Citizen* of March 2 will show: "It was reported to-day by a farmer from the neighborhood of Penbrooke that ptarmigan had been seen in the vicinity of the town. It is curious that if such be the case, none have been observed at other localities generally visited by this polar bird during the severe winter south of the Arctic latitudes." Some weeks ago another notice of the recurrence of the ptarmigan appeared in one of the Manitoba papers and was copied in the Montreal *Witness*. Of late years this bird has been very scarce and reports have been received at some of the Hudson Bay outposts, stating that Indian hunters, who sometimes accompanied almost entirely on their birds, were in a starving condition. When the snowfall is very heavy in the north the birds appear to perish in large numbers—not from cold, but owing to the willow brush being covered up. During such winters there is a large migration southward of the ptarmigans, and numbers are killed by hunters and lumbermen to the northward of the St. Lawrence and Ottawa rivers. Some twenty years ago it was said that the birds brought in our markets at Montreal and Quebec in large numbers, but since then they have almost completely disappeared. This, then, has been a "ptarmigan winter," and a cold and severe one too it has been.—H. G. V. (Montreal, March 3).

**FEW AGAINST THE HOUSE.**—No less than four woodcock have met death in the same manner, i. e., flying against the house; and the last fellow tried it while we were all sitting on the piazza one fine summer evening, "twixt daylight and dark"—Zip bang! and poor little longbill was straggling his life away on the gravel walk at our feet. I gathered him in, and I have him mounted; and a fine bird he is. The bill was uninjured, but the top of his head was literally smashed to pieces. The house stands on an elevation, and is painted a buff color, which may account for these frequent casualties. It is also located at Bay Ridge, L. I., on the line of flight of the migration, which would seem to have something to do with it, as three of the victims were found late in autumn.—DICK.

## Game Bag and Gun.

**GAME RESORTS.**—We are always glad to receive for publication such notes of desirable game resorts as may be of help to our readers. FOREST AND STREAM. Will not our correspondents favor us with such advice?

### SMOKE MEMORIES.

FIVE TIME SECOND—A POT SHOT SPOILED.

"A peaceful pipe the shepherd plays."

**THREE** "clock on the morning of July 4 each year always found the "royal four" at the "Water Hole" on the Sag Harbor turnpike. First, a cat was made by the dogs on the east side and then we commenced the real work on the west side of the pipe toward the brick kills (gone for more than forty years). I have shot through almost every kind of cover for summer birds, but save a small swamp at Moutauk nothing could compare with this cover. We had to crawl through and beneath the densest tangle of bull brier and wild rose, getting our shots not through skill, but by intuition, luck, or whatever you might call it, for it was impossible to put the gun to shoulder for a sight. Birds were plenty, but rarely left this dense cover. However, we usually got a dozen birds and thought ourselves paid for all trouble.

One time we had a New York chap with us who could outshoot Daniel Boone (let him tell it). We worked the bull brier gully, as well called it, but our new friend had not made a shot. This was nothing against him, for we old chaps, who knew the whole racket, saw him there in the same plight when we had got through the thicket, or at least we hadn't a bird and perhaps had made several shots.

After picking up a few birds at several places further ahead, the party divided for a short time to meet at a very likely place, which would require the four to work in a thorough manner. The New York gentleman and the writer were to follow a drain through a short meadow to where it met a creek, and then wait and watch for our friends, who took both dogs for some different ground close by.

The trysting place was lovely. Some large willow trees grew a short distance from the bank of the brook and the cattle had made a wallow or resting place under their cool shade. The other side of the brook was a thicket of wild rose and a few alders. Where we halted a little knoll topped with a clump of bushes gave us cool shade with a delightful view through this vision of willows, brook and rose bushes. We both enjoyed it, and while awaiting our friends we our pipes and chafed of the sport so far and prospects for the remainder of the day.

As we talked we spied two woodcock under the shade of the willows, and motionless silently watched them. I never before had such an opportunity to study their natural movements, and I know my companion never had, for he asked me what kind of birds they were. They could not have been thirty feet from us, and we, lying upon the bank as we did, were not perceived so long as we remained motionless. For a full quarter of an hour we watched these birds bore, eat, plume themselves and meditate. How pretty they were—graceful, stately, moderate in their meal! It seemed to me that they heard the worm, ere they thrust their beaks into it, and that faintly, faintly, they would pick his or her head on one side, quite near the ground, as he or she moved along, and suddenly turn and thrust the long beak into the soft earth, but I noticed not always successfully.

A sound from my companion caused me to look toward him, and none too soon—the pot-hunter had quietly raised his gun and was drawing sight upon our pretty neighbors, motionless as pot-then where they stood, he threw up his gun as he fired; of course, our birds were not so slow. There was nothing too bad for me to be called for spoiling his shot. I had to threaten to pot him, and while our wordy war was in progress our companions came up, and after hearing the story, were so indignant that Mr. New Yorker was then and there invited to leave our company, as we considered ourselves gentlemen, and not pot-hunters. We always considered, in our little club, that a man who shot a game bird sitting was not fit company for us, and we did not hesitate to say so.

A true sportsman does not go out for meat; that is of secondary importance with him. I had rather spend a day in the woods and fields, coming home with an empty bag, happy if I have been able, as on that day, to come face to face with nature. I have been into a nut forest for squirrels, finding them plentiful, and come away with a score, for I was well paid to sit still and watch them *as nature*. I didn't want meat. Whether I should carry this feeling so far as to sit still and watch a grizzly who was watching me, I can't say. Perhaps he might want meat. RETONDS.

HOSKINS, MASS.

### WINTER AT INDIAN LAKE.

**IT** is March 19 and no more sign of spring than January 20. It is cold and the snow is fully four feet deep on the level. It has been the longest and hardest winter among my many years past. I have not seen a single grouse since the first of November, and I have not seen a single ptarmigan since the first of December. I have been killed to some extent in some parts of the Adirondacks. In this part of Hamilton county, I think, they have not been killed to any amount; I have heard of only two within fifteen or twenty miles from my place of business. As I do business with all the lumber camps in this section, I have had good opportunity to get information. I have heard of several being killed in Essex county and some in the Raquette Lake region.

Ruffed grouse must have perished to some extent this winter; the great body of snow has crusted over several times, and you know their habits in the winter, and as they were not very plenty last fall owing to the cold rains of last spring, the next year's crop will be small. I never knew this noble bird to be more plenty than in early last spring. In coming through the woods I noticed a cover after every thinking at the same time what spot I would have, five months later in season, but I was very much disappointed when in September I wrote to some friends in the city to come and join me in the sport to find that the many flocks of ten and fifteen birds in the spring were reduced to the old birds and from one to three half-grown chickens in each flock. Of the two hundred that I shot during the season, not more than thirty-five were young birds. My usual number of these birds for the season is from three hundred to three hundred and fifty, and about fifty woodcock.

Woodcock are getting more plenty every year in this section. I shot about twice as many last season as the season

previous. No one cares for woodcock here but myself; not one in ten of the inhabitants know what they are. Many an old farmer has told me that they had seen some in the dry trees about their farms, after my inquiring of them if they knew of any—their meaning of course the red-headed woodpecker.

Spring I can hear the drumming of the cock grouse not over three hundred yards away from my dooiepit. It is very tempting to the small boy with the old musket, and once in a while to a big boy, too. It is a great pleasure to the lover of the gun to be able to stand an hour or two from his business on a bright October day and return with two to six birds. I have done this time and again and without going more than half a mile from home. Once, two years ago, I stood on my dooiepit looking across the valley at a small patch of woods that I wish you would try to catch four full-grown grouse playing in the sand. It did not take long for me to step inside and get my gun from its case, and secure the whole four after flushing them two or three times. You cannot do the same from your office, but you can enjoy your short mild winter better than we can four feet of snow for six months.

O. ST. M.

### CAPTURING A GROUSE ALIVE.

A bird in the hand is worth two in the bag.—*Old French proverb.*

THERE are many peculiar incidents happening in the life of every sportsman when afield which never appear in print, and so fail to add either to our knowledge or pleasure. I do not mean great events; not escapes from fire or flood, but those which may be very simple and yet peculiar as well as interesting.

Every time I see the words "ruffed grouse" in the articles appearing almost weekly in FOREST AND STREAM, I am reminded of a number of just such incidents in which I have figured when in pursuit of that noble bird. I was born and brought up within hearing of his drum beat, and the habits, haunts and tricks of this king of the woods are as familiar to me as my mother's tongue. The incident of which I write occurred some ten years ago.

At that time my "right-hand man" was Duke, honest, earnest old Duke, whose grandfathers, straying from his baronial estate in times gone by, was gobbled up by a Jersey farmer and put to the menial task of furnishing the motive power to a dog churn, until one day, "Squire" Smith, in search of fun and feathers, happened that day, and thenceforth the dog occupied his legitimate station among the canine nobility, and from his loins came Duke—peace to his ashes! he sleeps now under the Norway spruce in the garden there.

It was late in November. A thin coating of snow lay in patches upon the ground, and it was almost too cold for agreeable field work, but the air was bracing and so we hurried away on this particular afternoon to a famous ground known as the Deep Hollow, and a favorite haunt with me when time was limited. Following an old road for our right, an impassable foundered road, we crossed our left a gently sloping hillside, with here and there a towering beech or maple tree, and now and then a hemlock. So open in fact was the ground at this point that I was musing as I walked upon the time when this hillside was in its primeval glory—with its giant pines and oaks, and all this slope was dim and obscure and weird—when like a flash a full-grown grouse appeared seemingly from nowhere, passing within twenty yards of my left, and moving with incredible celerity. As I swung my gun from my shoulder my gaze was arrested and my aim changed from the swiftly flying grouse to that of an immense hawk in close and deadly pursuit. The situation was explained. So close was the pursuer that his eyes and beak were plainly visible, and as I pulled he doubled up like a pocket knife and fell dead; then as an encoeur I gave him the other barrel. I can never forget the contrast presented in these few seconds—the pursued preceding innocence and helpless ness, the pursuer with outstretched beak, ugly talons and glaring eye, strength and ferocity.

Even in this short space of time I had found leisure to mark down the grouse, for instead of taking to the swamp for cover, the bird dropped on the open hillside at the base of a large rock. Duke by this time was laboring under strong excitement, and from his actions I knew had marked the bird as well as myself; so moving up to within fifteen yards I had the pleasure of seeing Duke assume one of his characteristic poses.

Expecting each moment to see the bird flush with the customary rush and whirl, and scattering of dead leaves, I was in no haste; but as no such thing happened, I slowly moved step by step toward the rock, until at last I laid my hand upon it, reaching as it did about breast-high on the lower side and sloping into the hillside above. Then I carefully made the circuit, then I boisterously repented the journey, kicking up the leaves with my feet as I moved, and still Duke drooled and trembled. Then I laid my gun upon the rock, and "hunted without a gun," but I did it on my knees, pawing away the leaves and feeling into every nook; still no bird.

By this time thoughts began to seem queer and uncanny, and to give vent to my pent-up feelings I picked up a pretty good row about there for one lone hunter. So long as the ground indicated I determined not to give up the search; so, seating myself upon the rock, I critically surveyed the scene and noted all places and objects. The nearest tree was a chestnut, ten yards to the left; between it and the rock, I now discovered three or four chestnut sprouts projecting above the bed of leaves. On these sprouts were a few scattering leaves fluttering in the wind, the whole forming a kind of net. As the tree stood from a small two-inch stub, I supposed the mound was not over three or four inches in depth, not deep enough to cover a full-grown bird. Moving from my position I carefully parted the sprouts, when to my surprise I found a bed of leaves a foot deep, and snugly hidden away within their depths a full-grown uninjured female grouse.

Now I was truly in a quandary, and with my gun out of reach and the bird under my nose, I secretly stared at it; but I did the best thing possible under the circumstances, stooped quickly down, grasping her with both hands, and removed her from her hiding place.

Having no cord with me and desiring to take her home alive, I got down upon my knees, placing her upon her back between them; this relieved both hands, which I employed to unfasten my suspenders, and then tied her as best I could and placed her in one of my game pockets. I found I could do no more hunting that afternoon, and the fortunate fact that I had no imaginary birds at all points of the compass, and would stiffen out every time he got my wind; then I would break

his point by moving up and showing him the live bird, at which times his antics were laughable.

From the time I caught the bird until I reached home, my captive made no attempt to escape. After showing her to the family I carried her out free from the trees, and tossing her high in the air, I had the satisfaction of seeing her wing her way on strong and even pinion to her native hills.

Now the question arises, Was this a case of hypnotism, or was it not? Was it a suspension of will power and so muscular power through fright, or did my act of laying her on her back and gently pressing her with my knuckles while lying produce this strange passive state in this wild thing?

I have experimented with the common barnyard fowl, laying them upon their side or back upon the floor and gently pressing them, and I have found that a suspension of will power was produced, the time depending in each case upon the conditions under which the experiment was conducted. Under very quiet conditions I have had them remain in this position for ten minutes. I think it can be done by anyone who chooses to try the experiment.

If there is anyone among your readers who has had the pleasure of catching a full-grown and uninjured ruffed grouse with his bare hands, I would like very much to see his experience in print.

WHITE MILLS, PA.

### RABBIT SHOOTING.

BY PAUL PASTNOR.

IN the winter time, when our Northern woods are deep with snow and all our game birds, save the heavily and unapproachable grouse, have been driven to warmer climes, little feather-footed puss affords the true sportsman some glorious sport.

There is a charm about rabbit shooting, in the deep, still, white woods, that rightly endears it to the gun lover. Planted comfortably in the vicinity of some zig-zag runway, knee deep in his snowy shooting pit, the sportsman stands alert and listens to the music of the hounds. The flushed woodcock with the eager-baying of the dogs, now far away and growing fainter, and now approaching a warm, quick cry, that causes him to tighten his grasp on the trusty barrels and peer sharply down the white aisles and spaces of the trees, expectant every moment of the bounding, noiseless form of frightened puss. It will need a quick eye and a steady hand to stop her in her bounding flight. I know of nothing which stirs the sportsman's blood more quickly and thrills all his nerves more keenly than this waiting for the little white fugitive on the wide whiteness of the snow.

There are sportsmen who pretend to think that rabbit shooting is tame, and do not care to take part in it. I cannot help but think that they are lacking in something which goes to make up the complete and perfect sportsman. No sport surely could have more of the fascinating charm of anticipation in it than rabbit shooting, and as for skill and difficulty—which form the spice of the sportsman's pursuit—fail to see any remedy who has ever tried it can claim that puss is dull and easy shooting. I have known crack shots in the field and on the wing to miss the bounding rabbit again and again. She comes up so noiselessly and unheralded, white as the snow and only to be distinguished by her motious and long fawn-colored and pink ears. Likely as not that it is in a thick, brushy place that you see her, or between the close-standing stems of young saplings. Now let the contumacious wing-shot talker, with his sublime conceit, his gun comes up in quite a staid fashion after all, for a man who is to shoot tamely and for the pot. His eye glances along the barrels with an anxious alacrity; the muzzle of his gun swings through a swift half-arc, his fingers nervously contracting and then relaxing on the trigger, as he alternately trusts and doubts his aim; and finally, with a sheepish look, he lowers his breech-loader and puss disappears in the thicket, wing-shot talker, "got the hang of it." "Wait till the rabbit comes round again." "The rabbit comes, but not in the same path. She darts across the open space in front of him. He fires—and there is a great sputtering of snow about a foot behind frightened puss. She survives, comes directly across him on the right, plunges into the brush, and is out of sight before he recovers sufficiently to use his other barrel. Old rabbit-shooters like to see a concerted young dead-shot and trap-shooters like to "bush" in winter. They have loads of fun with him, and he learns a thing or two. After he has once got the knack of it, however, he doesn't despise rabbit shooting, and he enjoys the sport all the more, from having found out by experience that it is sport.

I think our best sportsmen are getting over their foolish prejudice against the "hairs." They are coming to learn that it takes as much skill to hit a rapidly moving object on the ground as in the air, and, some think it even difficult, for there are apt to be more embarrassing obstacles in the way in brush shooting, and in the fields the range is usually greater than in bird shooting. I have always enjoyed my winter rabbit shooting as keenly as the pursuit of any other game, and I do not find that the sport clogs upon me by reason of too easily earned success. I miss a rabbit as often as I miss a bird, and with as good an excuse. And then, where in birds are reasonably plenty, the sport is light lively and wears the hood. It is not like waiting drearily all day behind the expected runway of a fox, and then, after sky reynald, has made his long circuit, and the excited baying of the hounds proclaims his return, seeing him suddenly swoop aside and go over the top of an adjacent hill and disappear for the night.

It affords run nearly in a circle and take a brief course, if well followed by the hounds. They do not often return exactly to the place where they were started, but somewhere within a few rods of it they are sure to pass. If several dogs are running the sportsman must keep his eyes open for "scarred" rabbits; they may come up at any time from any direction.

A rabbit should never be shot except when it is in motion. It is almost brutal to mow the poor little creatures down when they stop to listen for the dog, or to catch the direction of some unexpected sound. Take them fairly as they start, and stop shooting when you have as many as you need for the table, or for a friend, and I warrant you, brother sportsman, you will agree with me in saying that rabbit shooting is one of the most exhilarating and delightful sports with dog and gun.

As for the proper dog to use, I think the best, taken all in all, is the ordinary foxhound, trained, as much as possible, to run rabbits alone. Beagles are too lazy and clumsy, and pointers and setters are too fond of foxhunting. The foxhound is large, strong of limb and deep of chest, and possessed of a perinacity and endurance which is of great value in this

kind of sport. He will sometime leave a rabbit trail if he strikes the fresh track of a fox, but can generally be recalled or recaptured, if the sportsman is provided with a team. I have very often found it necessary, however, to resort to this expedient. Foxes venture into thick cover far less than would be supposed; and when the rabbits are once fairly started and the dogs in full cry, there is little danger of their seeking a fox track on the outskirts.

The season with us is so late this year, that we are enjoying the rabbit shooting close up to the first of April, and may yet be able to make an "April fool" of the sportsman who thinks "rabbit shooting is as easy as turning over your hand."

### THAT SCREAM AGAIN.

Editor Forest and Stream:

I had done with "secreds," but it seems that criticisms and answers are still in order. The last comes from a gentleman who signs himself "Picket" (FOREST AND STREAM March 15).

The article savors strongly of "sarkasm," ridicule, burlesque; loose rather than logical; rather superficial than solid. It commences with: First, "Nessmuk" is "well right." "But he does not go far enough." "There never was a horse worth \$500," etc. Second, Again: "There have never been gun worth over \$40." "Nessmuk" had better sell those Damascus barrels and buy a Zulu gun at \$5," etc. Third, "There never was a diamond worth \$100. I will bet my choicest cyoodle," etc. Fourth, "When you come to talk about pictures, language is inadequate." (I should say so.) Fifth, "Land is another thing that people are great tools about. I own a lot on which you could raise as much garden stuff, or build as fine a house, as on a lot," etc. Dear "Picket," what does all this amount to? Wherein is the point? Sixth, "Look at gold for another thing." Just so. "But for this we could make coins that would look just like gold, and not one man in ten could tell the difference. Wherein is its value?" Just so. As to the concluding remarks of "Picket" about "Nessmukian philosophy," they may be relegated to the "Regions of Gimli" (or boredom).

I have tried to be brief. I wish to be honest; to be square. Let us resume.

First, The \$500 horse (make it \$5,000 if you like). Foot up all the expenses of the winners, also the losses. Give us the list of English peers, of *idignis omne*, who have won and lost; who have squandered and lost large estates in a single year. Make a business thing of it. Do not count the suicides, the ruined. Only give us the square business proceeds of profits and losses. When you get down to this, divide the remainder by the number of first-class racers who have assisted at the rascality of race-tracks, and give us the result in round numbers. If there is any remaining balance, place it to the winners. And report.

Second, "There never was a gun worth over \$40." Who said that? I did not. I have said, time and again, that I admire a thing of beauty; that I admire a poem; a painting—

"But not through thick and thin,  
Nor think it such a thing as ne'er hath been."

If the Zulu, or the army musket, were just as good as my Damascus barrels, I would take them. But they are not. They are ugly. They are unwieldy. They are unsafe. They are noisy. The "Picket" like an army mule. Who shall dictate that I take such an unwieldy weapon into the field? Where does "Picket" pick-it up in this style? I expressed plainly my love of the beautiful in flies, rods, Damascus barrels, paintings, fine chromos, etc. And "Picket" calmly relegates me to the Zulu gun and army musket. I take in no 3-cent chromos. I do take in Prang's best chromos. I take in no \$5 Zulu gun, nor army muskets, a plain, business shotgun at a sensible price. Much ink has been shed in abusing the "Zoo" and musket, mostly by men who can afford more costly outfits, and whose ire is aroused at being crossed in the field by a grinning darkey or "low-down" white, with one of these guns. I have witnessed this thing often, and it tickles me hugely. It is true that the gentleman sportsman, with his costly gun and high-priced secret kills four birds to that darkey's two, but what of that? What business has the darkey there, anyhow? Or the poor, shiftless white? They ought to be on their way, laying up a stake to flank the poorhouse in old age. That is about the argument. The insolence of wealth. The vulgarity of money without culture. The arrogance of dollars, gotten honestly or otherwise—but gotten. And it is one of the most humorous things I know, to see one of these high-goned sportsmen cut off on a heap of quail or grouse by a splay-footed darkey with a "Zoo." I always think of Byron's "Deformed Transformed."

"The rascals have as much right as he."

After more than fifty years' experience I can safely say that the most brutal trick I know of is the fact that three deer were shot down in a lick at one time and left there to rot, without even having their throats cut, one of them being a doe with a full breast of milk. The deed was done by a noted "Clericus," not unknown to fame as a preacher and hunter. Any old North Woods guide can give the name, which I withhold on account of his family.

"If I have any fault it is digression."—Byron.

Let us return. "Picket" drags in gold versus bogus, pure diamonds versus paste, with city versus country lots, etc.

"And such a lot of skin-like-skinable stuff as puts me from my faith."

These similes and comparisons seem to me irrelevant. But as most readers read without reflection it may need that I reply. Firstly, the pure diamond is a thing of and within itself. Its paste imitation does not contain one grain of the material which makes up the pure article. The imitation is a fraud, likely a crime. The pure diamond is only a bit of crystallized charcoal, and the man who gives up a life competence for a glittering piece of nonsense that can neither give him food or shelter may well be called a fool. But a pure diamond is very beautiful, and the fortunate fool who has more money than brains may do worse than pay it out for a thing of beauty that will last forever. In these times it will sell, and the paste imitation will not.

The same holds true of gold. There is no metal like it, or having the same qualities. If the civilized world chooses to take it at a certain value, can "Picket" or "Nessmuk" reverse the decision? And is a bogus imitation pure gold? As to the last question, it seems to me so far-fetched and so absurd that it may well be left to the dealers in corner lots, agents, etc.

The assumption that I would value a painting according

to the cost of the property it represents is a trifle flippant, but hardly requires an answer. It may be suggested, however, that if two pictures are equally well executed, equally true to nature, so that the best judges cannot agree as to which is the original, why not copy the real value of the pictures cannot be so very different. A fine painting is not a bank note. The value is dependent on execution and fidelity to nature in the one case, on the genuineness of signature in the other. The material, colors, canvas, etc., is the same on both pictures, the artistic skill not distinguishable. One may be a copy, but both being alike true to nature, neither is a counterfeit.

And this simile is fair and apt, only that the \$25. plebeian liver and white is not a copy. It may have a longer and better line of ancestry than his \$1,000 cousin, only it is unwritten. His blood, bone, muscle, and entire make-up are essentially the same as the pedigreed Laverack or Drovers. In the field he is tougher, harder and less liable to nervousness and gun-shyness. If he works just as well as the field-workers, why is he less valuable? As for the blood, nonsense of doggedness, "pedigrees are like potatoes—the best part underground."

## THE MAINE DEER QUESTION.

Editor Forest and Stream:

After an absence of some over two months I am home once more. It looks a little different from what it does in the summer about here. Cleft Rock Hall (the dining-room) is buried in a snow drift; and while wondering just where Camp Averens was I stuck the heel of my snow-shoe square into the top of the chimney. I have given the editor of the *Forest and Stream* my views on the matter, and have found my way through the cracks, have had my supper, turned the plate, cup and saucer bottom side up all ready for breakfast, and as I stretch out before a blazing fire and pull the wrapper off from the last FOREST AND STREAM, I realize that "you never feel so much at home as when in your own shanghae." And what better can-pire companion can a man ask for than a FOREST AND STREAM right out of the wrapper? I have carefully read all that has been said, and after reading it carefully I am glad to know that there is one man left in the world who has courage and fairness enough to stand up and say: Give the other side of the question a chance, let it be decided on its merits, and not by prejudice and misrepresentation. And while I do not by any means claim to be the looked-for advocate, there is an explanation that I beg leave to make in the eyes of myself and the rest of the "other side," namely, in the eyes of my Maine friends, brought disgrace on ourselves by asking for summer shooting of moose, deer and caribou in the three counties embracing and in the vicinity of the Rangeley lakes. We did not by any means ask for the whole State of Maine, as has been represented. The slaughter of deer that has been going on in our State the past season is nearly a hundred miles from us. I believe that the whole number of deer killed in these three counties from October 1 to January 1 would not exceed ten. Would it not have been much fairer in our worthy critic, the Boston Herald, that got so well posted upon the Maine deer question, to have allowed this instead of trying to make us shoulder the eighteen hundred deer claimed to have been killed and marketed from the eastern portion of this State? There they are, professional market-hunters, and want to make their deer in the State. Here we want to market ours in the woods to the sportsman, as well as our trout. That petition asking for summer shooting was signed by every man, I believe, in our region that it was presented to who is interested in our sporting travel. Is it likely that we who have been brought up here and spent much of our time in the woods, have worked and invested our money in this business, know nothing about it that we would ask for, as we claimed, the privilege of "killing the coose that is laying the golden egg" for us? Will some one who would really know what a deer was if he saw one, please tell us where the value in the Rangeley region deer is if summer shooting is not to be allowed?

I'll admit still-hunting on the fall snows is much the fairest and most proper way to hunt them, but owing to the hardships and uncertainties in our region, we are practiced to any other way by city sportsmen in the winter. Jack-shooting, in my estimation, comes next. In either of these ways the deer are not taken advantage of by dogs or deep snows; they are not driven to the pond, and if there is anything in the looks or smell of their favorite watering place that they don't like they make their stay short. If everything works well, the wind, the weather, the boat, the jack, the gun, the guide, and the hunter, all the deer are plenty of game, and he may be successful. If any man is so thick that there is anything lazy about sitting perfectly still in a boat six or eight hours, let him try it.

The fawn question, I am aware, is a very important one, and by the mother does being shot as early as July, in many cases they would die. But very few of them would be deprived of their mothers, I think, for I believe that when the mother is dependent on her milk, she leaves it in the night; if she goes to the pond at all it is in the evening and early morning. She then leaves her fawn hidden back in the bushes. Watch her as she feeds, and every few seconds you will see her raise her head and look and listen in the direction of her fawn. Is a State law needed to protect the deer in this condition? I think not.

As long as there are deer in our forests they will be hunted in some way or other by people of one class or another. Good feeding and public sentiment go much further in the woods than the fear of the law. There is such a thing as fashion even among woodsmen. As long as summer shooting is not practiced, there will be crust hunters in the winter. Allow summer shooting, and I honestly believe that no law can be made that will better protect the deer. Then the cruster sees more money in leaving them for the sportsman than in killing them, and the first opportunity the deep snow and torn to pieces by the dogs, is it not the deer they do not and does not the killing of the deer at this season of the year mean death to just as many others as if she was killed the day her young was born?

The deer are very plenty in our region, much more plenty than they were five years ago. And as long as dogs and crusters are kept down they will remain abundant. They will never be increased by jacking, for the reason that the places where they can be jacked is but a peck compared with the territory of good feeding ground where they cannot be. It was with the best intentions that we asked our Maine Legislature to grant summer shooting, but not even September was opened for us. More law was what was wanted to keep down the "restless poacher" and the "game thief."

Under the many obligations that we are (in the Rangeley region at least) to the visiting sportsman, and as dependent as we are on their patronage, I think we cannot do better than to offer them the best we have, and try to please all classes. Who can say that game shooting is not a blooded sportsman that enjoy jack-shooting as there are that enjoy trout-fishing? My only reward for the trouble I took to do what I could for what I sincerely believe would be much to the advantage of the State of Maine, the visiting sportsmen and the game, was unjust censure from a leading newspaper which at least might have been expected to give a fair deal. And if whoever encouraged the Boston Herald to mark up the forest and game question was really interested for the public good, they should have cautioned it to not be too extravagant with its censure, then I think that the article last fall on fish propagation and the two articles this winter on the game question would have had a much better effect, especially with the people who know and look on both sides of the question. If it may have been better if "Clericus's" suggestion had not started me aging, or if I could not have found pen and paper to-night, but I feel that I have been unjustly accused and have a right to say so; and when the Boston Herald publishes the statement that "the Maine game commissioners say that" a certain person "has done more prospective and actual harm to the deer of Maine than the best of Legislatures can repair in many years," and the commissioners say that they did not say so, it looks as though the advocates of summer shooting were not the only ones in disgrace.

CAMP BEVIS, Rangeley Lakes, Me., March 17.

CAPT. F. C. BARKER.

## SUMMER SHOOTING.

Editor Forest and Stream:

In several recent numbers of the FOREST AND STREAM have appeared articles in which the subject of "Summer shooting" has been discussed pro and con, and we now beg leave to add our mite to the "con" side of the question. While we acknowledge that we are at present in the minority, we are glad to know, nevertheless, that the FOREST AND STREAM is on our side, and we believe in the right on this question, as it always is on others, and we are confident that we are in the majority with regard to this important question they are in the majority; even as the reformers of old found that at last the cause of the few became the cause of the many.

Although we have read, yet we cannot hearken unto the plea for deer shooting in July, even though that is the only month when our friend can satisfy his ambition to be called the "Deer Slayer," nor are we able to follow in the wake of "Clericus" and men of his "cloth" who advocate the killing of woodcock in July, for they too closely resemble the renowned "Rev. Adirondack Murray," who openly boasted of killing dogs in the early summer months.

Who are the advocates of summer shooting? Men who keep summer boarding houses and hotels, and wish to advertise "good hunting and fishing within a stone's throw of the house;" and hotel-keepers, who supply their tables with game, and would as soon shoot a young rule grouse, which the law protects until the first of September, as they would a woodcock; and "Clericus," who advocates it from purely selfish motives, and has no regard for the laws of God or Nature.

This same "Clericus" says that "something must be trusted to the honor of men. As a knight of the trigger, I would not run to conceal my public conduct as a summer shooter if a half-grown grouse should suddenly rise up before him, for I believe he would, if possible, bring it to bag as soon as would an unprincipled market-shooter."

If "Clericus" needs exercise we would suggest that he borrow a "Rosinante" of some friend, and with his "Don-Quixote" ideas he can undoubtedly find enough "imaginary foe" to keep him busily engaged during his vacation. Better this than to come before the public as a market-shooter and inwardly as a roaring lion, seeking what half-fledged birds he may bring to bag.

If "Clericus" has the "strange fascination for the trigger" that he says he has, let him go forth on a bright October day when nature has had time to fully mature the birds, and we think he will then feel, as he probably never has before, what it is to have a common sense of the game, and know that he has not trespassed the laws of nature.

We heartily endorse every word written over the signature of "W." in your issue of March 22. As he says, to shoot a game bird when it is not fit for game is murder, and in July the woodcock are not fully grown, have no fat about them, are weak, immature things, and can be easily shot by any man who knows how to hold a gun and pull a trigger. In August the birds, young and old alike, are moulting, and are therefore weak and sick, and not fit to serve on the table until September.

His defense of the farmers is also well timed, and we trust that ere long "Clericus" and other advocates of summer shooting may see the folly of their ways and become possessed of a little of that charity that "thinketh no evil."

HUNSON, N. Y., March 25.

Editor Forest and Stream:

There is, among sportsmen, at least among those who put their views in print, one subject which seems to induce acrimony. Need I mention it? It is, of course, spring and summer shooting. The latest impetus and newest line given to the controversy has been the good-natured and rather fanciful challenge of "Clericus," the bright and pert reply of "Others," a sedate rejoinder by the former, and a large number of sober remonstrances from everywhere against "Clericus's" heretical views.

I have some reluctance in entering the arena, and do not propose to become a combatant further than to state an inference from my own limited experience. It has been said—of course, it is true—that the reasoning from data supplied by one section of the country may fail in another, where the same conditions are lacking. So, arguments which are unanswerable on one statement of facts, may sustain the reverse of the proposition where circumstances entirely different exist.

Recreation, I take it, is the indulgence in an occupation which is at the same time innocent and agreeable. It is distinguished from sport, which is a contest from which occupation, by the addition of the element of activity, mental or bodily. It implies a change from our ordinary pursuits or business, although they may be in themselves both innocent and agreeable, and it may be far more arduous and exhausting than they.

All animals are benefited by recreation, whether they be

wholly, or half, or quarter, or not at all "brain-workers," from "Clericus" himself down to the horse in the cider press "turned suddenly out to grass."

I assume that the form of recreation most agreeable to all your readers of FOREST AND STREAM is the pursuit of game, be it clothed in fin, fur or feather, which was the business of our ancestors (post-Simian), and which is our pleasure. We should, therefore, have the widest opportunities to pursue all forms of game consistent with its preservation in reasonable abundance.

We should not destroy game except within reasonable seasons. We should not kill the parents when rearing their young, nor the immature offspring, and the seasons should be arranged to prevent the possibility of such an occurrence. But the seasons should be arranged to suit the habits of the game, and so arranged, too, as, if possible, to give the pursuer—be he brain-worker or what you will—an opportunity for an outing at any time in the year.

Let us look at the matter of shooting woodcock in July. I can only speak for my own section of the country. I am not a naturalist, but I know the habits of woodcock here. The birds arrive in Southern New Jersey in February in large numbers. They immediately begin to nest, and by the middle of June all are full grown, and they are abundant. By that time the swamps and meadows have become dry, and by the opening of the season in July all but a few birds have disappeared. In August these, too, have gone, and no more are seen until October, when the fall flight of scattered and rare birds yields an occasional trophy to the quail-shooter. The spring birds are abundant; they rear their young with us; there are but few birds in summer, and the fall birds are purely migratory, and yield but one or two days' good shooting, immediately after the first severe frost. There are none of these numerous birds shot in the spring by the inhabitants, as I believe. Few are they in summer, one who knows their haunts can, in the cool of the evening, secure a half dozen, giving him recreation and furnishing a delicacy appreciated at his own table or by his invalid neighbor. Not fit for the table? Far more welcome is he than later in the more mature autumn traveler, lean from his long flight, and contesting supremacy with snipe and quail, and rail and canvas-back.

The old protest, that if there is no summer woodcock shooting we should have no summer shooting at all, carries no weight as applied here. If we have no summer shooting we shall have no woodcock. We ought not to shoot them in spring, for they are breeding; we cannot in autumn, because they are not with us.

We are told, too, that we should give up spring shooting of snipe and bay birds. I have never seen any valid reason as applied to this locality. The birds do not mude or breed here, they are yielded as returning to their summer residences. Why should the death of a snipe or curlew in spring diminish the game supply more than if it had occurred the previous summer? He has raised no young in the interim, nor has he begun housekeeping.

One word in regard to the "persecuted farmer." We are told that he is damaged by summer shooting. One man, I think the "Others," says that fields (sic) have been posted because of game, and that from the standpoint of my location, this seems extraordinary.

The State claims dominion over the game; it undoubtedly has it; it is one of the *jura regalia*. The State can ordain when game may be killed, and by whom. But the State can give the right to no man to go on another's land to slaughter the game, although it can prevent the owner. Therefore the "persecuted farmer" is really a granger. In certain seasons kill game on his own land, that is, he is on a footing with the other citizens of his State in this respect. But he can prevent its appropriation by any other person, at any time, in season or out.

What has this to do with summer shooting? My observation is that many farmer's wish to protect their quail. They like to see the birds about their farms. Occasionally they are told to permit a friend to shoot a few, but they don't want these birds exterminated, or anything like it. But I have yet to see the man who objected to shooting woodcock.

The summer shooter is an object of wonder to them, not unmixed with good-natured contempt. The idea of a man who can live in an office, in cool linen, facing a South Jersey swamp, in the uniform of a game-riding, see deep local mud, permit a friend to shoot a few, and then fight uncountable mosquitoes, for the sake of a few "mud snipes," not half so good as chicken, gives them material for plenty of uncomplimentary gibes. I never heard of any farmer objecting to summer shooting. Of course, if, as suggested by the "other crust," and others following of his ilk, this or any other "sportsman" should break fences, wound cattle, or do any other thing which is in the way of his work, the farmer would have cause for complaint, and could redress his injuries under the laws.

But why the more occasion for offense in summer than in fall?

PITTSBURGH.

## NOTES FROM CHICAGO.

[From our own Correspondent.]

YOUR correspondent at this point has had little to chronicle lately, as the season is just betwixt and between—neither the proper hunting, and assuredly not the proper trap-shooting season. Pigeons for the latter are scarce, and the ducks have only recently arrived on our waters. The hunting for the past ten days, however, has been very fair. The game has been in the hands of all kinds of ducks, such as redheads, spiketails, pintails, mallards, greennings, blue-bills, teal, butterball, widgeons, and in fact nearly every kind known to northern lakes and rivers. The late cold snap has sent them south again, that is, nearly all of them. The lakes are partially frozen up, and only running waters remain open. Still the boys bring in good bags every trip. John Gillespie, John Higgins, and several other sportsmen, such as redheads, spiketails, pintails, mallards, greennings, blue-bills, teal, butterball, widgeons, and in fact nearly every kind known to northern lakes and rivers. The late cold snap has sent them south again, that is, nearly all of them. The lakes are partially frozen up, and only running waters remain open. Still the boys bring in good bags every trip. John Gillespie, John Higgins, and several other sportsmen, such as redheads, spiketails, pintails, mallards, greennings, blue-bills, teal, butterball, widgeons, and in fact nearly every kind known to northern lakes and rivers. The late cold snap has sent them south again, that is, nearly all of them. The lakes are partially frozen up, and only running waters remain open. Still the boys bring in good bags every trip. John Gillespie, John Higgins, and several other sportsmen, such as redheads, spiketails, pintails, mallards, greennings, blue-bills, teal, butterball, widgeons, and in fact nearly every kind known to northern lakes and rivers. The late cold snap has sent them south

the bottom of the river. His huge hunting dog sprang in from the overturned boat and seized him by the coat. A farmer near by put out in a flat boat and pulled over to where Schutz had gone down, succeeded in getting him safely into his boat. It was a narrow escape from a watery grave.

The death of S. H. Torril has been profoundly felt through this section of the country, and letters from sportsmen all over the State expressing regret and condolence for his family have been daily received by his friends. The Illinois State Sportsmen's Association met Monday, March 26, at the Palmer House, to draw up suitable resolutions of respect for his memory.

At the time of the heavy floods and rain storms this year about January there seemed reason for thinking that most of the quail in Illinois, Northern Indiana, Iowa and Nebraska had been killed off in the open fields. Now more encouraging reports are being received by local sportsmen from everywhere. A letter to the FOREST AND STREAM correspondent from Jerseyville, Ill., says that the informant has heard from all through Central Illinois, and that about two-thirds of the quail survived, and that the shooting will be better than last year. From Iowa come very encouraging news. With a good breeding season and a let up on the breaking of game laws there will be fine quail shooting next fall.

## ANOTHER HETERODOX SCREED.

Editor Forest and Stream:

I have seen a great many articles in your paper on the subject called "The Protection of Game," and most of the writers blame the "market-shooters" and "pot-hunters" for being the excuse for the scarcity of game, so as to need protection. But if there were no "market shooters" nor "pot-hunters," the so-called "gentlemen sportsmen" would kill more game, and they would soon find that the game still needed protection. The only way to protect game is to stop killing it entirely, which, for a term of years, and to hunt only where it is plenty if one hunt at all.

As far as the "market-shooter" is concerned, I think it is a great deal better for a man who kills large quantities of game to sell it (so that many folks who are not able to spend the time and money to hunt themselves, can have a taste of game once in a while), than it is for a "gentleman sportsman" to go on a shooting trip and kill to throw away. I read an article in a paper a while ago, where a sportsman started after woodcock the day the law was off, and the conductor told him it would be no use to go to the place, as a gentleman had been there two or three days before and shot sixteen. This made my gentleman sportsman mad, but he thought he would go there anyway, thinking there might be a few birds left, but he found none; so he said he would see if the game could not be protected, and the game laws hived up to, and he would put that "law breaker" through if he could find out who he was. Now I ask the question: Would the game laws be better protected if he had found the sixteen woodcock instead of the man that broke the law? I say no. He would have shot all he could. The fact of it is, the rich "gentlemen sportsmen" want to have all the shooting themselves, and only go in for "protection" so that they can slaughter more themselves when they go out.

Now, I can see no fun in shooting from forty to a hundred yards across a grove, one day for a month at a time, unless you sell them. If I wanted real sport, I had rather work hard all day for ten good fat ducks or grouse, than to murder a hundred or so. There is no skill about it where they are so thick that all you have to do is to take out and put in shells and fire away. There is no sense in a man—even if he is worth millions—shooting more game, or catching more fish than he can use when he is off on his annual shooting or fishing trip. I have read your paper from No. 1 up to date, and I must say I am sick of seeing in every paper a howl from a so-called "gentleman sportsman" saying, "Death to the market-shooter!" "Down with the pot-hunter!" "We must protect the game!" "So we kid-gloved hogs" will have more to shoot and more to brag about! Of course I do not mean to say that all "gentlemen sportsmen," rich or poor, are hogs, but I am afraid a great many of the rich ones are. I think those "sportsmen" who hire guides to shoot out and hunt out the game, ought to be placed in the same category with the "skin-hunters," who leave hundreds of buffaloes to rot on the plains.

I think the "gun and rod clubs" organized all over the United States for the protection of game, ought to have a pro once in a while to brace them up to their work; they claim to be in favor of protecting the game, but as soon as the law is off, each member seems to vie with the rest as to which will kill the most game, and I believe there are a hundred birds killed now to what there were once before there were any "rod and gun clubs." As soon as a club is formed in any town, a number of the merchants, ministers, lawyers, doctors, clerks, etc., who make up almost wholly the great crowd called "gentlemen sportsmen," join the club, a great many of whom never fired a gun in their lives, except when boys, nor caught fish either. But after they have been a few times to the wilderness of "York State" or Maine, or the Western plains, have the same tales to call themselves "true sportsmen," and tell of their experiences, and set themselves up as men able to give good advice on all subjects relating to gun and rod, when they do not know the first thing about the subjects mentioned, but rely on their guides to place them on the best runways for deer, or the best holes in the ponds and streams for trout, and with their help kill and catch more than they can use, and they leave a few of the former and large quantities of the latter to spoil, just for the reason that their vacation comes only once a year, and that they must bring to bag all they can in the two or four weeks they have to spare for the purpose, so that they can brag when they get home as to what great sportsmen they are, and what large quantities of game they got. If this is being a "true gentleman sportsman," I do not wish to join the band.

My idea of a true sportsman ought to be is: a man who has used the rod and gun most of his life, who understands the nature and instinct of all the objects of his pursuit, who when in the woods or on the plain, and by the lake or stream, can by his own skill fill his bag, can paddle his own canoe, row his own boat, build his own camp, tie his own flies, and find his way home with no need for a guide, who enjoys being out in the open, free from care or trouble, who does not kill just for the sake of killing or bragging; who is willing every morning to start out with a gun and rod, whether red or black, gentleman sportsman or market-shooter, shall have just as good a time as himself, so long as they are not hogs, and do not kill everything they can find on their

tramps, but after killing enough for a meal, and perhaps for a friend, are ready to quit and go home, and leave what is left for some one else or for another year; and finally, one who lives up to the game laws, no matter what anyone else does, as long as the laws protect the game.

Now as far as the "market-shooter" and so called "true sportsman" are concerned, there is but little difference, one kills for profit, and the other for pleasure, and both kill the same quantity of game. The "market-shooter" is the best one of the two, for his game is sold to the market men, and then bought by people who have no time nor money to shoot themselves, while the "gentleman or true sportsman," after he has shot enough for himself, and a few friends, keeps on shooting to throw away. It is just as Frank Forester says in his "Manual for Sportsmen," page 283, viz.: "The fat of wanton destruction has gone forth against all the wild inhabitants of the woods, the fields, the marshes, and the waters, as irrevocable as that against the red Indians, for profit, for pleasure, for mere recklessness and the love of useless slaughter, the work of extermination is going on eastward, and westward, from the salmon rivers and trout streams of New Brunswick and Nova Scotia, to the prairies and plains at the foot of the Rocky Mountains." And again: "Many years will not elapse before no species of game, whether bird, beast, or fish, perhaps no wild animal, not so much even as a thrush, or a bluebird, will be left to enliven the fields, or the forest, and then too late, when the healthful toil of the sportsman has no longer an object, and the table of the luxurious epicure is deprived of its choicest dainties, America will bewail its shortsightedness, neither more nor less than that of the clown who slew the goose with the eggs of gold."

In a very few years more, and his prophecy will come true. How can it be prevented? I say it will help a great deal toward it, if the gun and rod clubs all over the country would protect the game the whole year through, and for a term of years where the game is scarce, instead of only protecting it through the close season, and then beginning to slaughter it the minute the law is off. It is a great deal better to "hunt without a law" where the game is scarce, than it is to lay the whole cause on the head of the "market-shooter," when the fault-finders are so much to blame themselves.

I ask all the so-called "true sportsmen" why they call a market-shooter or anyone else that knows enough, and is able to kill more game, or catch more fish than they can, a pot-hunter. Now I think there is a good deal of honor in being a first-class pot-hunter, far as being able to put out a good tender piece of meat for a pot not, at any market, is concerned.

A POOR OLD MARKET-SHOOTER.

ST. ALBANS, VT., Feb. 23.

## HINTS ABOUT LOADING.

Editor Forest and Stream:

Permit me to call the attention of your readers to an accident that happened recently to a friend of mine. Although such an accident might be avoided by the exercise of no other degree of intelligence than a well-bred collie dog is supposed to possess, yet I am convinced from inquiry and observation, that very many of those who have occasion to use and load shot shells (and especially those living in the country) are guilty of the same act that caused this accident, viz., decapping and recapping loaded shells held in the hand. The young man had been out shooting and one shell missed fire. After his return he loaded the cap at the butt of the shell (a Draper) and removed the primer, placed a new one on the nipple, and holding the shell in his hand with the butt down, attempted to force the primer home by light blows or taps on the stone hearth. Result—an explosion. The shell burst and his hand was shattered and maimed for life. If he had placed his hand over the muzzle of a loaded muzzle-loading gun, and held it there while forcing a cap on to the nipple by repeated blows of the cap or hammer until an explosion took place, he would not have been more careless. Further comment unnecessary.

I learn by your issue of the 15th, that Dr. Pitford, of New York, has invented a new shell, in which he claims to have the advantages of both paper and metal shells, with the defects of neither. It seems to be his opinion that by using metal shells as heretofore constructed the shooting qualities of a gun are impaired by the use of wads too large for the bore of the gun, etc., and I think this is true as such shells are usually loaded.

After much experimenting I have adopted the following method of loading metal shells when I desire extra hard shooting with a light gun: I use a 12-gauge; powder, 23 drs. Dupont's "choke-bore" No. 7, to which I add 1 dr. best fine powder (putting the powder into shell on top of course). I then put on to the powder a heavy cardboard 11-gauge wad, and place a 10-gauge pink-edge wad on top of the cardboard of harness leather (of about same thickness as felt wad), with from 1 to 14 ozs. chilled shot (if coarse shot, use not to exceed 12 ozs.), with 10-gauge pink-edge wad on shot. By placing the 10-gauge pink-edge felt wad between the cardboard and leather wads I succeed in expanding the felt wad so that escape of gas is impossible, more so than with two pink-edge wads alone on powder; and beside, all of the wad passes from the gun undisturbed by powder gas shot, the leather wad reaching the muzzle perfectly flat and true with bore of barrel. This gives a pattern remarkably free from bunches or open spaces. By using powder as stated, I obtain better penetration than any amount of coarse powder will give in my 12-gauge, 28-inch barrel, 7-lb. Fox gun. In fact, I have yet to see the gun of any gauge that will give better penetration, or that is more certain to kill a duck or grouse at any distance.

I have experimented for the purpose of ascertaining how much powder of size grain No. 3 Orange "ducking" can be burned up clean in a full 12-gauge breech-loading gun. I placed a board target, with the surface smeared with lard, two rods away from the muzzle of my gun; I aimed and shot, both with and without shot in shell. This I repeated many times, with more or less powder, cleaning target when necessary and putting on more lard. With 24 drams powder and one ounce shot I could not get any unburned powder either in greased surface of target or along the hard snow path leading to it. With 3 drams without shot I found some unburned powder both on target and along path, and continued to find increased amount of unburned powder as charges were increased up to 4 drams. But I found less when the shot was used in the shell. With 24 drams coarse and one dram fine powder, I could not find any unburned powder, and the pattern of the shot was much better than with 4 drams coarse with a trifle better pattern and with less fouling of the gun.

Any one who will take the trouble to fire, with a large

rod, one or more 10-gauge felt wads through a full 12-gauge gun from breech to muzzle will at once see why a uniform pattern cannot be obtained. When only 10-gauge wads are used the center of the uppermost wad will be raised in a convex form, causing dispersion of shot from center of pattern. Now place a leather wad 11-gauge on top of a 10-gauge felt wad and force through same barrel. The leather wad will reach the muzzle perfectly flat and true with the bore of the gun, and will give an even distribution. Some guns using 12-gauge metal shells are only 13 or 14 gauge at muzzle. In such guns use on top of felt wads and next to shot a leather wad that will just fill bore at muzzle, and an improved pattern will be the result. The principle applies to any gauge bore. I am well convinced from my experiments that using two pink-edge wads alone on powder will not give as good penetration as a single pink-edge placed between cardboard and leather wads of proper size. This is due, in my opinion, to the fact that the single felt wad thus placed expands laterally to a greater degree, thereby more effectively preventing the escape of gas with less friction.

Perhaps some other correspondents may add to my notes a description of their own experiments in loading.

WILLET, N. Y., March 20, 1883.

M. E. B.

## NEW JERSEY GUNNING GROUNDS.

THE following list of the names and addresses of equipped gunners of the New Jersey coast, with the shooting points at their command and their rates, is taken from a late issue of the Coast Pilot:

### CAPE MAY COUNTY.

CAPE MAY CITY—80 miles from Philadelphia, by West Jersey Railroad, via Market street wharf. Enoch Schellinger, Aaron Schellinger, Jerry B. Schellinger, Charles Schellinger, Reck Hand, Joseph Hand, D. W. Pearson, James Clark, A. P. Hildreth, E. C. Taylor, F. Sidney Townsend, Col. J. L. Lansing, Clark Brothers. Rates, \$2.50 per day and board.

CAPE MAY COURT HOUSE—60 miles from Philadelphia, via West Jersey Railroad. Charles E. Foster, William H. Foster, E. C. Wheaton, S. P. Hewitt. Rates, \$2 per day and board.

MATLIE—One mile from Cape May Court House. Lewis Ludlam, Benjamin Hawkins. Rates, \$2 per day and board.

DENNISVILLE—Four miles from Seaville on West Jersey Railroad. Edwin W. James, Joseph Blizard. (Upland and Sound shooting.) Rates, \$2 per day and board.

SEAVILLE—61 miles from Philadelphia, via West Jersey Railroad. F. Shute. (Upland and Sound shooting.) Rates, \$2 per day and board.

TOWNSHIP'S LEX—Via Seaville. William Sutton, Howard Rice. Rates, \$2.50 per day and board.

TUCKAHOE—Six miles off Woodbine Station on West Jersey Railroad—total distance, 62 miles. Major W. B. Brown, Thomas S. Clark. (Inland and Rivers.) Rates, \$2.50 per day and board.

BEESELY'S POINT—Reached via Pleasantville, West Jersey and Atlantic Railroad—total distance, 67 miles. Thomas Clark, Aaron Clark, William Sites. Rates, \$2.50 per day and board.

Gunning resorts in Cape May county are in and about the various sounds and thoroughfares, as Cape Island Sounds, Grassy Sounds, Jarvey Sounds, Cresce's Thoroughfare, Great Sounds, are well-known and available points in this county.

### BURLINGTON COUNTY.

TUCKERTON—Capt. Wm. Gaskill, Capt. Joseph P. Shourds, Hazleton Jones, Samuel K. Shourds, J. G. Downs, James Marshall, Lewis Parker, Samuel Shourds, Jr., Wm. A. Mathis, John Sprague, Henry Shourds, Wm. Horner, Wm. R. McDaniel, Noah Marshall, Charles Horner, Abram Price, Edward Parker, Mason Price, Peter Parker, James Horner. Rates—\$2.50 per day and board.

Available gunning points in Little Egg Harbor Bay accessible from Tuckerton: Gaunt's Point, Gaunt's Cove, Jermy's Point, Jermy's Cove, Rose's Point, Rose's Cove, Hester Sedge, East Sedge, West Sedge, Johnsey Sedge, Good Sedge, Shelter Island, Parker's Island, Middle Island, Bunches's Island, Hester Island, Bunches Island, Big Bunches, Barrel Island, Goose Bar, Buntion Sedge, Little Island.

### OCEAN COUNTY.

TOMS RIVER—Vincent W. Applegate, Lane Applegate, George Irons, Samuel V. Pierson, James Robinson, Fred. Grant, Israel Hoffmire, John Grant. (Bay gunning.) Equipped sportsmen with yachts. Rates—\$5 per day and board, boats and equipments.

John A. Applegate, Charles Seaman, William H. Gaunt, William Yarnote, James Loveblad, Gilbert Chadwick, Maxon Chadwick.

WEST CREEK—69 miles from Philadelphia on Tuckerton Railroad, via Pennsylvania Railroad by Market street wharf—123 miles from New York City. James Horner, Samuel Parker, Abram Price, Edward Rulon, Richard Cramer, Job Parker, William Horner, Abram Flaro, Aaron Flaro, Lewis Parker. Rates—\$2 per day and board. Well-known available gunning points in Little Egg Harbor Bay accessible from West Creek: Ham's Island, Sheep's Head Island, High Island, Little Island, Beach Meadow Point, Egg Island, Marshelder Island, Parker Island, Sand Point.

MANAHAWITT—65 miles from Philadelphia on Tuckerton Railroad; 118 miles from New York City. Frank Martin, Humphrey Martin, Dell Crane, Lewis Luman, Joseph Cramer, Josiah Fox, Cramer, William Letts, F. B. Oliphant. Rates—\$2.50 per day and board.

Well-known available gunning points in Little Egg Harbor and Barnegat bays accessible to Manahawitt: Egg Island, Thoroughfare Island, Lazy Point, Gulf Island, Bear Island, Parker's Point, Oyster Point, North Point, Reed's Fishing Point, Main Point.

BARNEGAT—80 miles from Philadelphia via Tuckerton Railroad; 133 miles from New York City via Central New Jersey Railroad. Henry Grant, John Horner, Stacy Burr, Jefferson Woodmanise, Charles Sprague, James Cox, Jesse Birdsall, Augustus E. Cramer, Charles Ridgway, Geo. H. Vannote, Jarvis Ridgway, Alphonso Eayres. Rates—\$2.50 per day and board.

Well-known available gunning points in Barnegat Bay, accessible from Barnegat, Harvey Cedars, Barnegat Inlet and Bay: Bear Island, Carver's Island, Little Sandy Island, Lovelady's Island, Voll Sedge, Gulf Island, Big Sandy Island, Marshelder Island, Sloop Sedge, High Bar, Clam Islands, South Point of Gunning River.

**FORKED RIVER**—50 miles from Philadelphia via Philadelphia and Long Branch Railroad; 40 miles from New York City via Central New Jersey Railroad. Furnish facilities for the accommodation of several parties, having yachts, boxes, and a gunning house on Great Sedge, Barnegat Bay. Rates—\$3 per day. Anthony Parker, Capt. Tom Potter, Theodore Predmore. Rates—\$2.50 per day and board.

Great Sedge and other available points in Barnegat Bay are resorted to from this place.

**PAVILLON**—Philadelphia via Philadelphia and Long Branch Railroad—change cars at Tom's River; 40 miles from New York City via Central New Jersey Railroad. John J. Potter, Wm. Potter, Ephraim Potter, Howard Potter (hay gunning); George R. North, Lewis J. North, John R. North (inland gunning). Rates—\$2 per day; with yacht \$4 per day and board.

Well-known available gunning points in Barnegat Bay, accessible from a Pavillon, are Cedar Creek Point, Great Sedge, Good Luck Point, and points north of Seaside Park.

## AN ADIRONDACK DEER COUNTRY.

HAVING taken much interest in the columns of your widely circulated and able journal, I am led to believe that perhaps some of your readers would take pleasure in a short account of this comparatively unknown and therefore unvisited portion of the world-famed Adirondack region.

Within ten miles of Paul Smith's fashionable quarters, it is seldom visited by his guests, although for the purposes of sport and health it is at least the equal of that region. A belt of thick forest separates the Upper St. Regis waters from the Lower St. Regis Falls—the last post-office on the north side of this belt, and Paul Smith's the last post-office on the south side. The distance between the two post offices is about thirty miles, and no roadway connects them. The landscape on the Lower St. Regis—strange to say—is more picturesque than upon the Upper and higher portions, the soil more fertile, the geological formation being different. The air is softer and still equally bracing, and fogs are rarer. There are no chilly winds at any time; balsam and other firs prevail.

But what will most interest your readers is the abundance of deer, bear and fur-bearing animals. Fishing is good. In regard to deer, it has been through the Adirondack Park a dark region every year or so since 1864, that I never saw deer so plenty anywhere as here, except in 1878, at Windfall Pond and that neighborhood.

I have just passed more than two months in this region and have not killed any deer as a matter of course, owing to the law, nor have I taken any pains to meet them, my pleasures consisting in trapping small animals. Yet in my walks for some thousands of miles I have never been able to go a mile without seeing runways which resembled the cow paths from barns to water troughs in depth and frequent use. I have seen *in propria persona* no less than twenty-seven deer walking or running during the last three weeks. One was so bold as to run at me attempting to buck and strike me with his fore legs. He was seized behind by A. M. McLean, a hunter, after which he was killed. He did not fear but chased our dog and would not run away although we beat him with sticks and even kicked him. This was even miles from any house and the deer was untamed. At length we set the dog upon him and he was persuaded to move off. There were six deer with this remarkable buck at first, most of them dead. They all ran off except the buck described so soon as they desisted us, but not with great speed.

I do not think I exaggerate in saying that between this place and Paul Smith's there are two thousand deer.

The law is enforced apparently, although, of course, there are infractions.

ELIE MO STAIN, near St. Regis Falls, Franklin Co., N. Y., March 11.

## A TEXAS SCAMPER.

THE morning of the 14th of March being favorable, we mounted our Texas ponies, saddled the horns, and with three staunch hounds, four pups and one cur, all eager for the fray, started for a chase. We struck out through scattering timber and brush, and had not come far before the hounds struck a trail, and right merrily they ran, in full cry for something over a mile, when they came to bay. The hog (musk or Mexican) had sought refuge under some roots in the head of a ravine. We arrived just in time to see him cut out, and cut a venturesome wedge for himself. Ever on the alert, flew to the rescue, and having relieved the puppy, was quick to get out of the way herself. At this juncture a well-directed charge of duckshot from a No. 12 bore rolled the hog over on the spot. When we examined our dogs we found two of the puppies and the cur badly cut. The wagon being near at hand we took the wounded dogs to it and started them back to the ranch.

By the time we had disposed of our wounded dogs, Flora had hunted up a wildcat trail. It was but the work of a few minutes to get the rest of the pack with her. They had it around through the brush or chaparral for a time, when they treed, but when we came up we found that the cat had tricked them. I scolded them soundly, and after circling around they struck him off. Through brush, over hill and across hollow we had it, the hounds sometimes nipping at the heels, and sometimes howling with delight. We were having good sport, but alas! we now found that our cat had quit our grounds and was making for some brushy hills in a neighbor's country, which was separated from our own by a wire fence, with no gate for several miles. Not to be outdone, we dismounted, threw off coat, leggings, etc., and started in pursuit. Our hunt was now reduced to three hounds, two pups and my cat, the last individual being none too active or light for such a chase.

By the time we reached the hills the hounds had got him up to a certainty, and were rattling him around at a lively rate. He finally concluded he would be safer up a tree; so up he went; but as we were approaching to the delight of the boys, he leaped out and off he bounded, with fanger and Flora at his heels. (We thought strange our other dog was not there.) He went into the brush, and after some time another tree. We approached cautiously, and, seeing him standing on a limb, let fly at his head. He sprang into the air and came down among the dogs, but getting away from them, made another tree a few rods off, and there, under that same tree, stood our other dog, Old Cap. On looking up there was our cat with bloodshot eyes, panting and bleeding, and to our surprise another one also, one of the largest of the species. Two hunters up to the necks in mud rather a rarity for even our country. We gave cat number

two a broadside and he fell dead. We then tumbled out number one, the boys having taken the scalp of each, we journeyed back to our horses, feeling that we had been paid for our walk.

BEVILLE, TEXAS, March 19.

SMALL SHOT.

**A NEW GUN-WAD.**—Mr. Edmund Redmond, of Rochester, New York, has added to his "diving decoy" another invention, for which he has just been granted a patent. This is a gun-wad, which may be made of shell metal or wire cloth, the two forms being shown in the illustrations. In his patent specification Mr. Redmond says: "The object of my invention is to provide a gun-wad that will reduce recoil, prevent leading in a gun barrel, prevent the bulging of a cartridge shell, and, when paper shells are used, obviate crimping or grooving the loaded shell and allow them to be crimped in the cartridge. Herebefore the shot in cartridges has been retained in position by a wad, which was held in the cartridge shell by friction with the wall of the shell or by having the cartridge shell pressed in against the external side of the wad. My invention consists of a disk, the edge of which is serrated and its shortest diameter perforated. The disk or wad is preferably cut out

of sheet metal or wire-cloth. When the wad is to be employed over the shot it should be a little larger in greatest diameter than the interior of the shell, so that it will hold in the shell and the shot will not fall out when fired. If found desirable, the wad for use on the shot could be made concavo-convex, so that when pressed flat against the shot in the shell its edge would be extended laterally and penetrate the shell-wall deeper than an originally flat wad would. In making the wad it should be finished with a sharp edge on one side and a blunt one on the other, and in loading the cartridge the rounded edge or convex side of the wad should be toward the shot and the sharp edge toward the shell. The sharp edge of the projections on the wad will then catch in the shell-wall when pressed home against the shot." The inventor also claims that the wire wad will act as a concentrator, the top layers of shot sinking into the interstices of the wire and keeping together several of the layers after leaving the gun.

**HOUNDING IN THE ADIRONDACKS.**—Editor *Forest and Stream*: A. R. Fuller's note in February 15 number is to the point. He met one of their best still-hunters, who acknowledged "that he had in five days last fall killed nine deer." He does not state, however, how many other deer he hunted and did not kill any. Or were those five days all the good hunting days for still-hunting, in which he succeeded in killing a couple to take back home, just sufficient to take off the curse. But on my way into the woods I met a couple of hunters returning. They had been out for a week with hounds and had succeeded in capturing nine deer, six of them bucks. That was better luck than Mr. Fuller had, in one sense, and worse in another. I would not have given a dollar for the whole lot, the weather being too warm for them to keep, even had I expressed them home. The law as it now stands is against the still-hunter, as there are but few days usually in the month of November when a man can hunt successfully. Secondly, he wants cold weather so as to keep the few he does kill. But the party that goes to hound can operate at any and all times, rain or shine, wet or dry. Now the still-hunter is the best game constable the woods would be the wiser to have. He is the best hounding at any season of the year. Mark that.—CAP LOCK (Frewsburg, N. Y.). [The publication of the foregoing note has been unintentionally delayed. As has been announced in these columns, the present bill at Albany will, if passed prohibit hounding entirely throughout the State.]

**THAT TUGH WOODCOCK.**—Worcester, Mass., March 24.—There has been a deal of discussion among the local hunters during the week, and various opinions expressed as to the cause of the remarkable vitality exhibited in the woodcock referred to by "Philohela Minor" in the *FOREST AND STREAM* of the 15th inst. One member of the Sportsman's Club thought the bird had been shot at so often by members of the Woodland Club that it could not realize that it had come to bay. (Of course the gentleman was not one of the team that shot a pair of Springfield on the 10th of August last, as per report *Springfield Republican*.) Another gentleman essayed the opinion that the bird was born with an "air-space" in the brain, so that when the wire entered the skull this safety valve proved efficacious as a life preserver. We have not given the matter much thought, but possibly it was one of those instances where life is prolonged by a fault. The bird, after being shot, lay in the snow where it had fallen, it hated to give up, lost it might be consigned to the Boston market, and the proceeds of sale of its little body invested in ammunition to be used in the extermination of its species; but then we don't know anything about it. It certainly was a—RARA AVIS.

**THE GAME IN THE PARK.**—We have received a letter from Mr. F. H. Conger, Superintendent of the Yellowstone National Park, written from the Mammoth Hot Springs, under date of March 15. We extract the following in reference to the game: "In the early part of the winter, and before the Secretary issued his order of entire prohibition, there were some few elk and some other game killed within the borders of the park; but since the receipt of said order by these headquarters all hunting has, so far as I am able to find out, been suspended entirely. The winter here has been comparatively mild, although the snow has fallen to a great depth on the mountains, and all of the large game has been driven to a lower altitude, far below this Park; yet every newspaper scribbler in the whole country charges all the game that he may hear of being captured anywhere to having been killed in the Park. The birds here are abundant for the season, the thermometer often marking 70° above at midday, and the snows are fast disappearing."

**CALIFORNIA GAME LAWS.**—The following synopsis of the new California game law is given by the Sacramento Bee: Section 1. It is a misdemeanor to kill quails, grouse and rail, or have them in possession between March 1 and October 1. It is a misdemeanor to kill doves between January 1 and June 1. It is a misdemeanor to kill male deer, mountain sheep, or elk between November 1 and July 1 following; and female deer and fawns shall not be killed at any season. No deer shall be killed for any purpose other than food. Sec. 2. Netting or trapping of quails and grouse is made a misdemeanor. Sec. 3. The taking of trout by any means other than hook and line is a misdemeanor, as is also the use of explosives to capture fish of any kind. Sec. 4. It shall be unlawful to take salmon during the month of August and at all times between sunrise on Saturday and noon of the day following. The meshes of all nets used must be seven and one-half inches longwise. Sec. 5. It is made a misdemeanor to set or use pound, weir, ed-net, trap, or other fixed device in the waters of the State for taking fishes. No salmon net must extend more than one-third way across a stream or slough. All young fishes of any species taken from the water must be returned thereto. The punishment for a violation of the provisions of the law shall be a fine of not less than \$50, nor more than \$300, or imprisonment for not more than thirty days or six months, or both, at the discretion of the court. Sec. 6. Any person who is imprisoned, one-half to go to the informer and one-half to the District Attorney; the act to take effect July 1, 1883.

**THE MACHIAS RIVER HOUNDING.**—Machias, Me., March 19.—Editor *Forest and Stream*: "Penobscot," in his article of March 15, says: "I am afraid that the claim of our honorable commissioners, that the law against hounding cannot be enforced, will be held water, from the fact that the Game Association of Machias utterly upped out hounding on the waters of the Machias River in a single season. \* \* \* I am satisfied 'Penobscot' will be pleased to have me correct him in this matter. During the season when the association determined to stop hounding on the waters of the Machias River, we asked help from the State, and Mr. Stillwell responded at once, and from thirty days to six months, or both, at the discretion of the court. I think—horse-hire and per diem for game police were obliged to send into the woods. We gave our time and helped the commissioners enforce the law to the best of our ability with the result of stopping nearly all the hounding in the county as well as on the waters of the Machias River. At this time we are having a nice frolic with the crust hunters, but we are the instrument in the hands of the commissioners. When we formed our association we agreed that our object was to assist in the propagation and protection of fish and game, and that we would work with and under the direction of the commissioners. Hounding and dogging can be stopped, with the aid of resident protectors, by the commissioners, but unless you can have their aid, it is uphill business. Where the laws are not enforced it is the fault of the residents, not the commissioners. Try it. I will have something to say on game protection in a few weeks.—OLD TIG.

**MAINE INDICTMENTS.**—Bangor, Me., March 22.—Editor *Forest and Stream*: Following are parties indicted for game offenses in Bangor, Me., March 22, 1893: The Oldtown, of Bangor, Me., indicted March term, 1883, Sylvester, of Eustis, as guides, all indicted March term, 1883, for killing one moose at Chain of Ponds, Franklin county, Smith, of Worcester, indicted for killing a deer at Tim Ponds in Franklin county. Lemuel Eames and George Emery, of Newry, Oxford county, indicted March term, 1883, for killing three deer on Bear River, in Newry, Me. John, guide, Dr. C. B. Porter, Albert E. Porter, Boston, indicted March term, 1883, for killing one caribou on Baker Pond, King and Bartlett Lake, Somerset county. Dr. Clifton E. Wing and David Hunt, of Boston, with John Phillips as guide, indicted March term, 1883, for killing one moose on Spencer Stream, King and Bartlett Lake, Somerset county. Ami Davidson, of Gardiner, indicted December term, 1882, for killing two moose on King and Bartlett Lake, Somerset county. Me.—LEX TALONIS.

**MAINE INDIANS AND DEER.**—Editor *Forest and Stream*: In talking to-day with an old deer hunter, he says there are hundreds of deer killed every year in Maine for their skins. The Oldtown Indians are the guilty parties. They use the skins for snow-shoes and moccasins. The hunter says that he has found several deer in a pile after being left by these pests. The skins are cured by the Indians at their camps, and the game wardens do not have a chance to lay violent hands on them. There are several parties of white men who have slaughtered forty deer each the last fall in Maine. We should like to induce some of them to commit suicide before the coming fall.—FLICK FLICK (Hartford, Conn.).

**RICHFIELD SPRINGS, N. Y., March 22.**—Seeing a notice in your valuable paper requesting names of good places to hunt and fish, allow me to recommend Richfield Springs, N. Y. It is a charming place, with plenty of partridge and woodcock shooting. Good accommodations can be had at Lewis', on Canadiana road, near Lewisburg, where there are twelve miles in extent, abounding with bass and pike.—H. F. WELCH.

**WILD PIGEONS.**—Suspension Bridge, N. Y., March 20.—Wild pigeons are reported to have made their appearance in very large quantities in the cedar swamps near, just twenty miles from Niagara Falls, Canada.—O. E. L.

**PHILADELPHIA, March 23.**—A pair of two English snipe have been seen on the Schuylkill River meadows near the Cross Keys, before the present cold snap set in.—HOMO.

On Saturday, a large deer, chased by dogs, was discovered along the western border of Fort Pano, facing the town. Walking and sometimes trotting, he attracted general attention, and excited men, women and children, who gazed up at the kindly forester, then seemed confused and undecided whether to take the corporation by storm or retrace its course. A black canine came round the point and saw the buck about the same time that his deerishness recognized the dog. The dog made a dash at the deer and cut a snarl, and the deer, in turn, ploughed up the rocks, the buck skimming the undergrowth, and the dog ripping through on a double tongue, close in his rear, making the descent in full view of a hundred spectators. Just east of the creek, on a hillside for the Potomac, several dwellings, gardens, etc., confronted the frightened and hotly-pursued animal, but he paused not nor avoided any obstruction; and bounding gardens, over a wall, and into the Potomac, swam across, and, reaching the river, he turned and, looking back at the starting crowd, Point, while a host applauded in his wake.—*Keeper Tribune*.

## NEW MAINE LAWS.

## INSECTIVOROUS BIRDS.

An act to amend section fourteen of chapter fifty of the public laws of eighteen hundred and seventy-eight, relating to insectivorous birds. Be it enacted by the Senate and House of Representatives in Legislature assembled, as follows:

Section fourteen of chapter fifty of the public laws of eighteen hundred and seventy-eight, is hereby amended by adding thereto the following words, viz:

"Under a penalty of not less than one dollar nor more than five dollars for each said bird killed, or in possession except alive," so that as amended said section will read as follows, viz:

Sec. 14. No person shall kill or have in his possession, except alive, any and several birds commonly known as larks, robins, swallows, sparrows or orioles, or other insectivorous birds, crows and hawks excepted, under a penalty of not less than one dollar nor more than five dollars for each of said birds killed, or in possession except alive.

An act to confer upon sheriffs, deputy sheriffs, police officers and constables, the powers of game wardens and their deputies. Be it enacted by the Senate and House of Representatives in Legislature assembled, as follows:

Sheriffs, deputy sheriffs, police officers and constables are hereby vested with all the powers conferred by law upon game wardens and their deputies, and shall be allowed for their services the same fees as are now prescribed for sheriffs and their deputies.

## MOOSE, CARIBOU AND DEER.

An act to amend chapter fifty of the public laws of eighteen hundred and seventy-eight relating to the protection of moose, caribou or deer. Be it enacted by the Senate and House of Representatives in Legislature assembled, as follows:

Section 1. Section three of chapter fifty of the public laws of eighteen hundred and seventy-eight is hereby amended by inserting the word "hunted" before word "killed" and by substituting the word "September" for the word "October," so that as amended said section shall read as follows:

Sec. 3. No person shall hunt, kill or destroy with dogs any moose within this State, under a penalty of one hundred dollars for every moose so hunted, killed or destroyed; and no person shall between the first day of January and the first day of September in each year, in any manner hunt, kill or destroy any moose under the same penalty.

Sec. 2. Section four of said chapter fifty is hereby amended by inserting the word "hunted" before the word "killed" and by substituting the word "September" for the word "October," so that as amended said section shall read as follows:

Sec. 4. No person shall hunt, kill or destroy with dogs any deer or caribou within this State, under a penalty of forty dollars for every such deer or caribou so hunted, killed or destroyed; and no person shall between the first day of January and the first day of September in each year, in any manner hunt, kill or destroy any deer or caribou, under the same penalty as above provided. Any person may lawfully kill any dog found hunting moose, deer or caribou.

Sec. 4. Section five of said chapter fifty is hereby amended by substituting the word "September" for the word "October," so that as amended said section shall read as follows:

Sec. 5. If any person has in his possession the carcass or hide, or any part thereof, of any such animal, between the first day of January and the first day of September, he shall be deemed to have hunted and killed the same contrary to law, and be liable to the penalties aforesaid; but he shall not be precluded from producing proof in defense. In case of his conviction, such carcass or hide, or any part thereof, so found in his possession, shall be decreed by the court forfeited to the use of the person prosecuting. And the warden, or either of his deputies as named in section sixteen of this chapter, shall have power to search for such carcass or hide, or any part thereof, subject to the provisions of section twenty, thirteen and fourteen of chapter one hundred and thirty-two, but the warrant may be issued on complaint of said warden or either of his deputies.

## MOOSE, CARIBOU AND DEER.

An act for the protection of moose, caribou and deer. Be it enacted by the Senate and House of Representatives in Legislature assembled, as follows:

Section 1. No person shall kill, destroy, or have in possession from the first day of September to the first day of January in each year, more than one moose, two caribou or three deer, under a penalty one hundred dollars for every moose and forty dollars for every caribou or deer killed, destroyed or in possession in excess of the said number, and in case of conviction all such moose, caribou or deer or the carcasses or parts thereof shall be decreed by the court forfeited to the use of the party prosecuting. Any person having in possession more than the aforesaid number of moose, caribou or deer, or the carcasses or parts thereof, shall be deemed to have killed or destroyed them in violation of this act.

Sec. 2. Any person owning or having in possession dogs for the purpose of hunting moose, caribou or deer, or that are used for such hunting, shall be liable to a penalty of not less than twenty nor more than one hundred dollars.

Sec. 3. The penalties prescribed in this act may be recovered in the manner provided by sections twenty-five of chapter fifty of the public laws of eighteen hundred and seventy-eight.

## SALMON AND TROUT.

An act for the protection of salmon, land-locked salmon and trout. Be it enacted by the Senate and House of Representatives in Legislature assembled, as follows:

Section 1. No person shall fish for, take, catch, kill or destroy any fish in any waters, except tide waters, with any net, seine, weir or trap, under a penalty of fifty dollars for the offense and ten dollars for each salmon or land-locked salmon, and one dollar for each and every other fish so taken, caught, killed or destroyed.

Sec. 2. No person shall kill or destroy any land-locked salmon less than nine inches in length, or any trout less than five inches in length, under a penalty of five dollars for each and fifty cents for each and every land-locked salmon or trout so killed or destroyed. Any person having in possession any land-locked salmon or trout of less than the above dimensions shall be deemed to have killed or destroyed them in violation of the provisions of this section.

Sec. 3. No person shall take, catch, kill or have in possession at any one time for the purpose of transportation more than fifty pounds in weight of land-locked salmon or trout, or of both together, under a penalty of five dollars for each and every pound of land-locked salmon or trout, or both together, so taken, caught, killed, in possession or being transported in excess of fifty pounds in weight; and all such fish transported in violation of the provisions of this section shall be liable to seizure, on complaint, and shall be decreed by the court forfeited to the use of the party prosecuting. Any person having in possession more than fifty pounds in weight of the fish aforesaid, shall be deemed to have taken them in violation of this section.

Sec. 4. All penalties imposed by any of the sections of this act may be recovered in the manner provided by section twenty-six, chapter seventy-five of the public laws of 1878.

## OTHER LAWS.

The following acts were also passed and have become laws: An act to prevent the taking of trout from Tappan Pond and Oriskany Pond in the town of Kingfield for the term of three years.

An act for the better preservation of black bass in Penesse-wassee and Hobbs's ponds in Norway.

An act to regulate the taking of fish in Mouson, Elliottsville, and Williamsville.

An act relating to fines and penalties recovered for violation of the fish and game laws. (This act provides that all fines and penalties recovered for violation of the fish and game laws shall be paid one-half to the complainant and one-half to any game and fish protective society or any other sportsman's association organized under the laws of the State and located in the county where said fines were recovered, provided that they spend the same in the propagation and cultivation of trout and salmon for the fresh-water ponds and lakes of Maine, to be done under the direction of the fish commissioners. The fish commissioners shall designate to which it shall be paid in case of there being more than one society in the same county.)

An act to prohibit the taking of fish from Messabie Pond and its outlet in the town of Alfred.

An act to prevent the taking of trout from Bryant's Brook and Beaver Brook in the town of Scarborough.

An act to prohibit the taking of fish from Bungeawant Pond in the towns of Alfred and Lyman.

An act to repeal Chapter 193 of the Public Laws of 1874, and of Section 17 of Chapter 50 of the Public Laws of 1875, relating to taxidermists, and all laws authorizing their appointments.

An act making Sunday a close time for game and birds of all kinds.

SAMPSON.

## Sea and River Fishing.

To insure prompt attention, communications should be addressed to the Forest and Stream Publishing Co., and not to individuals, in whose absence from the office matters of importance are liable to delay.

ANGLING RESORTS.—We shall be glad to have for publication lists of good fishing localities. Will not our correspondents favor us with notes of desirable points for angling excursions?

## BROOK TROUT.

This fish is in season on April 1st, as follows: California, Connecticut, Iowa, Massachusetts, Minnesota, New Jersey, New Mexico, New York, North Carolina, Pennsylvania, Rhode Island, Virginia, Washington Territory, and Wisconsin.

If thou vouchsafest to read this treatise, it shall seem no otherwise to thee than the way of an ordinary traveler—sometimes fair, sometimes foul; here champagne, there enclosed; barren in one place, better style in another; by woods, groves, hills, dales, plains, I shall lead thee.—*Burton's Anatomy of Melancholy.*

## TOT'S TROUT.

BY MRS. FRED MATHER.

O BEAUTIFUL trout with the crimson dot:

My grasshopper waits for you:

[know that you're hiding below that root,

And to reach you I'll wet my shoe.

I've borrowed a line from brother Ben,

A hook from Cousin True,

And I've hurried away from my kitchen and doll,

To pay a visit to you.

I saw you yesterday under the boat

With the polka dots on your side.

Your olive green mantle shaded with black,

And your fins spread out so wide.

You were real mean to go away so soon

When I just put in my hooks:

I only want to smooth your back,

And tell you about the land.

We've got the loveliest violets here.

Faunsies and Jacobins.

See how the mosses are shaded with white,

That will exactly match your fins;

And just the dearest golden bugs,

Some of them dusted with blue:

So, now, little troutie, just bite my hook,

And then I'll show them to you.

I'll show you the nest that the wren has made

In a hole in the hidden tree,

With two of the cunningest little eggs,

And nobody knows it but me.

I'll show you my doll and all of her clothes,

My kitten and Bessie's big dog,

The place where the bumble bees go in the barn,

And the moss on the old hollow log;

Come, beautiful trout with the peary side.

My grasshopper's getting all wet,

Bessie is calling and I must go home.

Or dolly will worry and fret.

Now, come, little troutie, do not so hard!

You are pulling me into the stream;

And you've taken the grasshopper off from my hook;

I just think you are real mean.

## BOYHOOD REMINISCENCES—II.

## THE SWAMP TROUT—BAGGING SUCKERS.

OLD Hunter had two places, perhaps more, where he was home large trout. He was a shrewd character, and produced only a few at a time, just enough to fill an order for a trout breakfast or to dispose of without attracting too much attention.

One of these places was discovered by that famous woodchuck shooter and pickerel fisher, Scott, who while skittering for his favorite fish, discovered a trout in a boat out in the middle of the reservoir, where he knew the water was at least ten fathoms deep. Now, he reasoned, the old man would not be there for his kind of fish, for pickerel don't lie in deep water, but nearer shore where there is feed. He tried to get nearer to find out what he was after, but the old fellow immediately rowed away. The next day Scott heard that Judge Mason had bought two trout of Old Hunter of nearly two pounds a piece in weight. Now, this reservoir was built to supply water through feeders to the Chenango Canal. There were two of these reservoirs, and on high ground, letting water into the summit of the canal. They were made from springs and brooks that passed through them. We all knew there were trout in the brooks, both above and below the reservoirs, for we had

caught many a one, but none over a pound. And we knew, too, that there were cold, terribly cold springs in the middle of the big waters, for we had swum across them and been chilled to our very bones. In fact one of the most promising young men—a student at the university—lost his life, having been seized with cramps while in bathing there. He was an excellent swimmer, but the extreme cold on a warm summer's day doubled him up, and before assistance could reach him he sank. Yes, we knew about the cold springs, but none of us dreamed of their being full of tremendous big trout.

Scott was on hand the next day, and he was a very fortunate fisherman on big trout for some time. He was boys' good hold of it I have forgotten, but Old Hunter was disgusted.

The second secret of his I discovered. I was picking strawberries on a side hill that sloped down toward a dense swamp, some two miles out from the village. I saw Old Hunter with his tin pail on his arm; his red tippet betraying him a quarter of a mile away, for he always wore it in summer as in winter. Old Hunter I now discovered stealing into the swamp. What is he after there, I wonder. "Yarbs," I suppose. For the old fellow had more or less knowledge of the healing powers of certain plants, at least he had the credit of this; and was often commissioned to gather certain kinds from time to time. "Yarbs," I guess. But why does he sneak in that careful way, and look around as if he didn't want it known that it was he and he there? I guess I will investigate.

I crawled on my hands and knees down to the fence, across the road, and through another fence, and was in the swamp ahead of him when the old man went in. It was a wet and boggy place fed by springs from the hills on both sides, and from which ran a small brook. Tradition said there used to be trout in the brook, but there were none, or but a few little ones, in our day. By careful dodging I did not betray myself, but kept within seeing distance of my object. When near the middle of the swamp he stopped and laid down his pail. With his hatchet he cut open a rhubarb or stinkweed, and thence took out five white grubs. Then from some inner pocket he brought out a fish line, and baited the hook with one of the grubs. Well, I had to laugh quietly to myself; going to fish in some hollow stump or hole for a woodchuck, I guess—when, behold! The ground where he stood was boggy and lumpy, with here and there small spaces of water, none of the surfaces of water being larger than a good-sized fish-belly. He walked across the swamp, the water rising when he stepped upon it. The old man stepped on a bog and dropped his baited hook over into what I supposed was water not more than a few inches deep, but to my utter amazement the line ran under and off at one side at least ten or twelve feet. A subterranean region of unknown proportions was there. It was not a minute before out came a trout of not less than a pound and a half; then another, until he had five not less than six pounds of the most superb trout I had ever seen. Best fish in the world, for no country nor climate can or does furnish anything so good as a wild speckled trout out of a cold spring. These were placed in his pail and carefully covered up with leaves, and the cover secretly tied down; and then the old fraud stole out on the other side of the swamp, to go away around the village, two miles or more, and come in from a different direction. Oh, he was a cunning 'coon!

It was no long before I had gathered up a good lot, and I caught six splendid fellows. How black they were, how fat, how short, and broad across the back, but genuine speckled trout. How cold and hard and, ye gods, how delicious. How the folks opened their eyes when I brought them home; and what a breakfast—words cannot do it justice. The memory of their sweetness, their plumpness and flavor takes me back nearly forty years. Alas! the swamp is long gone, cleared off and drained, making way for the farmer's grass. I wonder how many of those magnificent beauties perished thus, of no benefit to anybody. I don't think we caught them all, for they grew shy; and—sometimes wouldn't bite at all—but they were there.

Old Hunter found the ground trodden down the way very careful himself (in that respect) and he knew his secret was in somebody else's keeping. He caught me there one day, and his wrath was vehement. He caught me as much right as he. But he had a wife and a child to give it away, first by catching so many and by not being more cautious in my approaches, etc. Well, he was right, but I was a boy.

Bob Upham was the famous trouter of that region in later years, and I, am told, even yet. He used to have some sacred spots to which he would slip off and bring home big strings, but he never had the *Bonanza fontinalis* (how is that for early classics?) I had for awhile.

Talking about the old man, I bring up one of another favorite way of fishing. Did you ever hook suckers through the ice? Ah! that was fun. The canal and the different feeders furnished good feeding grounds for certain kinds of fish of the coarser varieties, especially suckers; and suckers in the winter were not bad eating, especially when you were so far from the coast, with no railroad near. Fresh fish, instead of salt cod or mackerel, were at a premium.

The way we caught suckers, and sometime pickerel and perch, was to go about five together, three to hook, and two to drive and change about. Our implements were three large hooks, fastened together in triangular shape; or better, a tool in the shape of a bay rake, only that the teeth were parallel with the rake's tail. Having cut three holes in the ice, thrown in a few white beans or some corn to light up the surroundings, we lay down over the hole, our hooks near the bottom, the heads of the baited hooks in the fish line, and the teeth sharp, of course, and pointing upward. The others of the party having gone above some ways on shore, then approached us on the ice with big clubs or a big chain, thumping the ice between them, thus driving the fish by us. And they came in schools, sometime big ones. As they passed over our hooks we jerked up, landing them on the ice, then thrust the hook into the hole with celerity to repeat the operation until the school drove off all by us. We would then move some distance ahead and cut fresh holes and then again others, until we thought we had sufficient of the fish for the day. On our way back we picked up our spoils at the various holes. Generally, we had a large hand-sleigh to draw them home on the ice. Sometime when we struck a big school, two expert lookers—for it was no slow business, I tell you—would land on the ice from one to two bushels of cod fish, this to be repeated in less quantity until the school is used up.

One of our biggest times, I remember, was a bitter cold day, but the excitement kept us warm. We drove the Lebanon feeder for several miles. We bagged (bagging suckers, think of it!) sixteen bushels, a one-horse lumber-wagon load. There were five of us, and we had suckers

enough each to give away to our friends and the poor of the village. Doc Havens was a famous hooker, as well as trout fisher. He was along that big day. I don't believe he has forgotten it. It took a quick man to snatch a pickerel, for they went by like a flash, but the Doctor could do it. When there was a chance for pickerel in the streams or rivers, they used to make a drive (which I didn't like), until I got older and could handle the hook like a veteran.

Well, those were great days.  
"If our foresight was only as good as our hindsight?" Yes, that is so. But it does an old fellow good to go back to them. Yes, I am getting gormless again. Good-night.  
JACOBSTAFF.

### TROUT OPENING IN FULTON MARKET.

THE annual display of trout on the opening of the season will take place in Fulton Market, New York, on Monday and Tuesday, April 2 and 3. Mr. Blackford sent out the following circular to trout breeders and others some weeks ago:

DEAR SIR: In addition to my usual trout display, I desire to give an exhibition of as many specimens of the various kinds of fish as have been hatched out or raised by fish-culturists of this country.

I should esteem it a great favor if you would send me a few specimens from the hatchery under your charge, accompanied by a label giving name, age, and all particulars necessary for the instruction of the public. All specimens should be shipped so as to arrive here early on April 1 or 2.

The object of this exhibition is to create a greater public interest in fish-culture. Trusting I am not troubling you too much I remain,  
E. G. BLACKFORD.

We are informed that in answer to this he will have both the rare and beautiful "Dolly Varden" trout and the rainbow trout from the United States salmon ranch at Santa, Shasta county, Cal.; the handsome "Clark's trout," *Salmo clarki*, from Nevada, as well as specimens from our Eastern troutmen from all parts of the East. The New York Fish Commission will send specimens of different fishes from its hatchery at Colden and Cold Spring Harbor. Mr. Jas. Annin and other private breeders will send their contributions, and the South Side Sportsman's Club of Long Island and the Suffolk Club will be well represented. The whole of the new market will be thrown open on that day; the dealers in meats, fish and game will endeavor to make a display for the public which will be attracted by the "trout opening" of Mr. Blackford. This gentleman has, by his enterprise and free expenditures, earned the thanks of the public for the establishment of trout day and its opportunities to compare the fish from different localities, and so to educate anglers to the observance of the different species and varieties. We will give our readers at a distance a good report of the exhibition, which will be one that many will regret their inability to see.

The invitation to the opening this year is in the style of Mr. Blackford's former ones, and while it may be more artistic, we hardly think it as beautiful as former ones. The cover contains a fair mermaid, without her traditional comb and glass, holding a ship which winds about and is inscribed "Opening of the Trout Season of 1893." Below is the verse:

"And whoso'er thenceforth trout I wait  
To take, and he devoirs my bait,  
My pleasure 'tis to then invite  
My friends to share in my delight."

On the inside is a rainbow and a Dolly Varden trout, side by side, while above and looking down through the water the brook trout is gazing at the strangers. A little non-descript in the middle seems contented to stay in the background. On the opposite page is the invitation and a water scene with rods and reel in the foreground.

### THE WALL-EYED PIKE.

(*Stizostichion*, Raf.; *Lucoperca*, Cuv.)

THE following communications on this neglected fish will prove of interest:

I was much interested in the report in your columns of the 15th regarding wall-eyed pike. As you express a wish for further notes on this subject, I will give you some facts that are largely within my own knowledge.

I have seen large numbers of wall-eyed pike caught at the St. Clair flats and on the St. Clair River, above the flats. The wall-eyed pike is a game fish, nearly, if not equally as game as the black bass. It is a bold biter, especially during the months of April and May, they are then leaving the lakes, going into the rivers before their spawning season. During these months it will give the angler ample opportunity to exercise his skill. I have never seen them taken with the artificial fly, but I have seen numbers of wall-eyed pike taken with minnows, which is the usual bait at the St. Clair flats.

In April and May they are trolled for with a spoon in the St. Clair River, and I have seen as many as eight large pike, weighing from ten to pounds each, taken in less than two hours. At such times it is a bold biter, and fights well for life and freedom. In the latter part of June and July they are spawning; then it seems they cannot be induced to take any kind of bait, and it is as well, for at such times they are not fit for food, and ought not to be caught. I have seen the wall-eyed pike taken with an apparatus called a "bobbing line," a piece of coarse line from eighty to one hundred feet long, with four large hooks fastened together in the middle, and with a grape of lead weighing about six ounces attached to the end below the hooks. They take this fishing tackle with a small skiff and row out in the stream and cast the line; the lead sinks to the bottom, and as the boats drift slowly down with the stream, the hooks are dragged or jerked along the bottom, as the angler keeps his aim continually in motion, which jerks the hooks along the bottom in this way. The bait is hooked in any and all places of the body, and if it is struck, the hook is landed in hand over hand, and the fish is taken apparently without a struggle.

The wall-eyed pike can only be taken in this way during the months of June and July, when they are spawning, then they seem to have no life in them, and nothing to do but float around the bottom of the river. Of course such fishing is a sport, and one who is not a sportsman would have but little chance to "hook" fish in this manner. At any other season except June and July the angler who attempts to take the wall-eyed pike either with the rod or the trolling line and spoon, will find plenty of sport and

ample opportunity to test their skill. The wall-eyed pike is strictly a game fish, and as a food fish he is second to none.  
WISCONSIN, March 19,  
MARTIN E. O'BRIEN.

My experience with the wall-eyed pike may throw some light on their game qualities. I have taken them in Block River with ordinary tackle, live minnows for bait, and found them hard fighters and free biters. I have also taken them in the Upper Onondaga. This river is clear, swift, and has a rocky bottom. My mode of fishing there was to use a light float, live minnow, a yard long leader, and seventy-five yards of line. I would then find a rapid and let the bait drop down with the current. The river abounds in bass and I caught them often than the pike, but I never could see any difference in game qualities between the two. I never tried them with a fly. I never fished for any of our fish with a fly, nor did I ever take them on a troll. My experience is that they differ very much from a chunk of wood, as your first correspondent thinks. Let him try them in cold, swift water and he will change his opinion at once. If living in sluggish water they might lose their game qualities. Bass caught in the lagoons near here are not so game as the same fish caught in mountain streams.  
PISCATOR.

LITTLE ROCK, ARK., March 19.

Presuming that your "wall-eyed pike," or "pike-perch," is what we in Canada call pickerel, or in the Province of Quebec "doré," I beg to add my humble quota of information regarding their habits, etc. One moonlight night some years ago, I caught one on a red bass fly when proceeding to shore after fishing near the St. Lambert's end of the Victoria Bridge, Montreal. Since then I have heard of several cases where they have been taken on a troll. My experience is that they differ very much from a chunk of wood, as your first correspondent thinks. Let him try them in cold, swift water and he will change his opinion at once. If living in sluggish water they might lose their game qualities. Bass caught in the lagoons near here are not so game as the same fish caught in mountain streams.  
PISCATOR.

OTTAWA, Province of Ontario.

I see in your issue of the 15th inst. that you invite contributions on the subject of the pike-perch. This fish is known in this locality as the salmon, and is comparatively rare. As a food fish it is fully equal to bass, but it does not afford as much sport to the angler as either the small or large-mouthed variety of the latter. In taking the bait he strikes very tamely, and when hooked keeps close to the bottom, never, in my experience, leaping out as the bass does. This fish is much scarcer now than formerly. I have been told by competent authorities that ten or twelve years ago they were as numerous as bass. At present, if the number of each caught in a season be any indication, our streams do not contain one pike-perch to a hundred bass. I am at a loss to account for this diminution in numbers, as they are only caught by anglers who are fishing for bass, never, so far as I know, being caught in nets or seines, or taken on trot lines. They bite best in early spring and late fall, and very early in the morning and late in the afternoon. The largest specimen I have seen weighed eleven pounds, and was caught in a trap on the "Muskeg Shoals." A friend of mine caught one in Cypress Creek, near Florence, Ala., that weighed nine pounds and some ounces. This fish was killed with very light tackle. The largest fish of this kind I have ever heard of was caught in a stream near this place, and is said to have weighed over seven hundred pounds.  
WILL.

SAVANNAH, TENN., March 21.

### A GROWL FROM GRIZZLY GULCH.

AFEW miles north of this place (our present camp) and about one hundred and twenty miles northwest of Denver, at an elevation of 8,500 feet in the Rocky Mountains is situated a body of water called the Lost Lake. Any person in this vicinity can testify that there is not another body of water of the same size in Colorado that is inhabited by trout of all sizes in such numbers as is said lake. Nor is this lake unknown to the money-making guide. In the fall of 1892 (under the leadership of one of these guides) came a party of five Eastern tourists to the Lost Lake. Game was plenty, mountain air was abundant, and trout was to be had by the hundreds within two hundred yards of their tent. Here for some four weeks this party of tourists remained living like kings and enjoying themselves only as the lover of rod and gun can enjoy themselves in the heart of the Rocky Mountains. They had all the game they could eat, and ten times more trout than they could make any use of.

The time came when they deemed it necessary to again turn their steps toward the rising sun. This party of tourists came here for recreation and sport with the rod and gun, and you may learn from what I have already written, that their desires were fulfilled to the utmost. Now would not any ordinary Eastern man be satisfied with such results? I sincerely hope so. But these hogish desires were not contented with the trout. The next morning on which they started on their homeward journey they obtained a quantity of giant powder, then taking a quantity of brown soap they made waterproof casings, inserted the powder therein, ignited the fuse and tossed them into the lake. These bombshells exploded with terrific force, killing the trout by the hundreds, and on the next morning the surface of the lake and its shores were one mass of dead trout of all sizes. But the tenderfoot were gone, and they might well thank their lucky bides that the party of miners and ranchmen did not know their whereabouts, for nine out of ten chances there would have been news of another necktie party had the infuriated inhabitants overtaken them. The writer would like to know if these five are what you call trout hogs. I should say that this includes the old man and the three boys. If it were possible for me to find out the names of this party I would cheerfully give them to you in full; but as it is I cannot add any clew to their names, nor do I know where they were from. All I do know is that they came here from the East.

In December last an old hunter and myself started on a two-weeks' hunt. We turned our steps toward a favorite deer locality in the Rocky Mountains. We were very successful. On our arrival there we found deer signs fresh and plenty. Now it happened that a party from New York city who claimed to be sportsmen (under the leadership of a guide), arrived at said grounds on the same day, and pitched their

tent within a mile of our cabin. The first thing that greeted our ears on the following morning before daylight was the crack of a rifle, then another and another and another, and this was kept up all that day and for the six days following. They were armed with repeating rifles, and it seemed to be their object to see who could shoot away the most ammunition.

It is hardly necessary for me to say that that party of New York did not see a deer the whole week they were there. Nor did we, for I do not believe that there was a deer within ten miles of either camp as long as that party remained. But greatly to our relief they took their departure on the eighth day, cursing the luck and the Rocky Mountains. My friend and I remained a few days later and got five deer.

Now the writer would like to know if this is the kind of sport that the majority of Eastern sportsmen, tourists, etc., are made. If so, for our sake and their own good they had better stay at home, and be contented with reading the FOREST AND STREAM and with what sport their native State affords them, for such vagabonds as the above will never make friends in the Rockies, nor will they ever be satisfied with their hunting here. But let the sportsman who is a sportsman come out here and he will be welcomed by a man, and will find friends at every camp-fire; and he can make up his mind that he will have a general good time.  
SILVERTIP.

GRIZZLY GULCH, Colorado.

### EARLY FLY-FISHING.

ELIAN, A. D. 291, a native of Macedonia, says: "I have received information of the following mode of catching fish in Macedonia. In the river Astrakos, which runs between Berana and Thessalonica, there are fish which are ornamented with spots of different colors, but the names they bear are best learnt from the people of Macedonia. Their food is the flies which frequent that river; and these flies differ from any that are found elsewhere; for they are small, of a white head and wings, but they unite in themselves the likeness of all these insects. The people of that country call them hippuri—horseflies; and as they fly near the surface of the water they are easily discerned by the fish, which therefore glides gently to the place where their shadows fall, and, just as a wolf snatches a sheep from the flock, with a gulp it seizes the fly and instantly plunges with it into the stream. The fish has been noted and copied by the fishermen, but with some variation, for they employ the natural fly which will scarcely bear the handling, but they imitate it by art. A small quantity of purple wool is wrapped around the hook and a couple of wings are added from yellow neck feathers of a cock. The rod and line are each four cubits long, and this contrivance when skillfully cast on the stream is found eminently successful."—From *History of the Fishes of the British Islands*, by Jonathan Couch, Vol. IV., page 228.

### NORTHERN MICHIGAN ONCE MORE.

Editor Forest and Stream:

When a boy I remember of reading that two knights armed "cap-a-pie" met one time at the junction of two roads, before the sun which stood in the largest of the clouds saluted one another, one knight remarked "on the black of his shield." "Not so," quoth the other, "his white;" which the first knight contradicted; and so one word led to another, until they agreed to fight it out. Coughing their lances, each charger was spurred forward with his greatest speed, and when the shock came knights and horses rolled in the dust. As the two warriors lay groaning on the ground a third traveler came up and stepped forth to him to settle the dispute. He, wiser than they, looked at the shield on all sides before giving his decision. Then chiding them for their hastiness, he informed them they were both right, as the shield was black on one side and white on the other.

It may be that your correspondent, "W. D. T.," and myself are looking at opposite sides of "the shield." However, before I am challenged to a larger fight, I will again by any doubtful champion, I want to finish this point and then retire. "Prairie Dog" does not expect to find trout on a mud flat, nor "under waving rushes," but he not only expects to, but has found them in streams where, though the country is much more rugged than Northern Michigan, it is more easily traversed, and where a person will not lose as much blood. Mayhap if "W. D. T." had found such streams he might have written some "of it." It may be pleasant to think that "enjoy to fish in the rain, camp in the rain, and live in a beddified state of dampness. I can and have stood considerable wet myself, but must confess I have a hankering after the dry spots, other things being equal.

It may be my "feet are tender," though I imagine if "W. D. T." had followed me in some of my wanderings his would have been caloused. If "W. D. T." had been careful to read just what I said in regard to the fish of Northern Michigan he would not have attacked the article in quite the style he did. Your correspondent, "G. H. W.," in issue of March 8, at least shows a willingness to admit that all might not think alike.

"W. D. T.'s" axiom must be of the kind of old saws Mark Twain calls frauds, for I will vouch for trout not always being scarce in the Rocky Mountains.

Discussion is a fine thing, and it is also a fine thing that we all do not think alike or all want to always visit the same section of the country. And also that each person sees certain sections of the country in a different light from his neighbor. I do not for one moment contradict "W. D. T.," but I would like to ask him to reply to a question. First, if he has visited a country where trout were numerous, flies and other "living" do all claim nearly perfect (of course not perfect; I don't claim that for any), scenery grand and everything harmonious; second, he then visits a place he has heard much in favor of, finds it greatly overestimated, finds a great many things conspiring to make it unpleasant, does not find the fish he expected to and knows he could have done better elsewhere; third, however, he finds other "living" do all claim nearly perfect (of course not perfect; I don't claim that for any), scenery grand and everything harmonious; second, he then visits a place he has heard much in favor of, finds it greatly overestimated, finds a great many things conspiring to make it unpleasant, does not find the fish he expected to and knows he could have done better elsewhere; third, however, he finds other "living" do all claim nearly perfect (of course not perfect; I don't claim that for any), scenery grand and everything harmonious; second, he then visits a place he has heard much in favor of, finds it greatly overestimated, finds a great many things conspiring to make it unpleasant, does not find the fish he expected to and knows he could have done better elsewhere; third, however, he finds other "living" do all claim nearly perfect (of course not perfect; I don't claim that for any), scenery grand and everything harmonious; second, he then visits a place he has heard much in favor of, finds it greatly overestimated, finds a great many things conspiring to make it unpleasant, does not find the fish he expected to and knows he could have done better elsewhere; third, however, he finds other "living" do all claim nearly perfect (of course not perfect; I don't claim that for any), scenery grand and everything harmonious; second, he then visits a place he has heard much in favor of, finds it greatly overestimated, finds a great many things conspiring to make it unpleasant, does not find the fish he expected to and knows he could have done better elsewhere; third, however, he finds other "living" do all claim nearly perfect (of course not perfect; I don't claim that for any), scenery grand and everything harmonious; second, he then visits a place he has heard much in favor of, finds it greatly overestimated, finds a great many things conspiring to make it unpleasant, does not find the fish he expected to and knows he could have done better elsewhere; third, however, he finds other "living" do all claim nearly perfect (of course not perfect; I don't claim that for any), scenery grand and everything harmonious; second, he then visits a place he has heard much in favor of, finds it greatly overestimated, finds a great many things conspiring to make it unpleasant, does not find the fish he expected to and knows he could have done better elsewhere; third, however, he finds other "living" do all claim nearly perfect (of course not perfect; I don't claim that for any), scenery grand and everything harmonious; second, he then visits a place he has heard much in favor of, finds it greatly overestimated, finds a great many things conspiring to make it unpleasant, does not find the fish he expected to and knows he could have done better elsewhere; third, however, he finds other "living" do all claim nearly perfect (of course not perfect; I don't claim that for any), scenery grand and everything harmonious; second, he then visits a place he has heard much in favor of, finds it greatly overestimated, finds a great many things conspiring to make it unpleasant, does not find the fish he expected to and knows he could have done better elsewhere; # Rifle and Trap Shooting.

To insure prompt attention, communications should be addressed to the Forest and Stream Publishing Co., and not to individuals, in whose absence from the office matters of importance are liable to delay.

## MUZZLE VS. BREECH.

*Editor Forest and Stream.*—Your issue of March 22, W. Merrill takes me severely to task for the errors into which I had fallen in my reply to his article of February 22.

After having pointed out my errors the Major expresses a hope that I will "make a suitable apology to your readers." I am perfectly willing to make an ample apology to your readers if after having heard my defense, they think themselves entitled to one.

First, for the errors into which I have fallen, I claim that important omissions in the Major's first article are mainly responsible. Had he (as he should have done) described the breech-loader in his first issue as he did in his second, I should not have made the mistakes I did.

Second, the Brown military gun, weight 43 lbs., loaded with fixed ammunition, did make a string of six, in 10 shots at 300 yds. I think that that fact, which this coincidence was sufficiently striking to have misled me.

The gun was shot without cleaning in accordance with match regulations. I have these "facts" from Mr. Henry Blinn.

To sum it all up, though freely admitting that I have made a mistake in assuming that Maj. Merrill's breech-loader and mine were the same, I claim that I will not allow myself to be misled by the circumstances, but was unjustified. Unimportant because, although I confused two separate things, my facts still remain. A bona fide breech-loader and muzzle-loader, applied quite hot, less of being used, was beaten last a small fraction of an inch (less than 1/16 in.) by a muzzle-loader weighing 40 lbs.

Third, this as a complete and final victory for the light breech-loader, and if your readers do not endorse this claim, I am ready with the apology demanded.

In this second article the Major insists "that the breech-loader should shoot the fixed hunting ammunition proper, and the same that we have to buy at the store; that the bullets conical, so-called, shall be shot naked from the muzzle."

Now, if we admit that the store ammunition is inferior to that we load for ourselves, is it fair to compel us to use it? And if the muzzle-loader is allowed a fair-paced bullet, why should the breech-loader be denied one?

While admitting the desirability of extreme accuracy, I do not see that it is essential in a hunting rifle, shot at ordinary hunting ranges, to use a rifle with such exacting accuracy as 1000, circle at 300 yds. answer all the purposes of a reliable hunting arm.

If this question is answered in the affirmative, the following comparison will fill the bill. A Snider rifle, 45-caliber, chambered either for 45 or 70 grains of Hazard F. G. powder, as may be preferred. Shells to be carefully filled, and a lead carbide wad placed squarely on top of the powder. A naked grooved bullet, 45 grains, 1.200 ball put to be inserted on top of the wad, equal to 1/16 in. in depth in the shell. The grooves of bullet to be filled, with a lubricant, vasoline and sperm oil, applied quite hot, less of being used in summer than in winter.

A more skillful marksman than I am, can do far better work than this rifle possibly do, but I will not.

In his concluding paragraph the Major censures me—I fear justly—for having shown discourtesy toward him. For this I hasten to apologize without making any defense.

JAS. PRATT.

## RANGE AND GALLERY.

**CREEDMOOR AND MASSACHUSETTS TARGETS.**—The Creedmoor targets are as follows: Third Class, to be used at all distances up to and including 300 yds.—Target, 45x60. Bulseye, circular, 1 in. in diameter, circular, 1 in. in diameter, 1/16 in. in diameter; outer, square, 45x60. Second Class, to be used at all distances over 300, and including 600 yds.—Target, 45x60. Bulseye, circular, 1 in. in diameter, circular, 1 in. in diameter, 1/16 in. in diameter; outer, square, 45x60. First Class, to be used at all distances over 600 yds.—Target, 45x60. Bulseye, circular, 1 in. in diameter, circular, 1 in. in diameter, 1/16 in. in diameter; outer, square, 45x60. The Massachusetts targets bear the same rings, marking diameters of 3/16, 1/4, 5/16, 3/8, 1/2, 5/8, 3/4, 7/8, 1, 1 1/8, 1 1/4, 1 1/2, 1 3/4, 1 7/8, 2, 2 1/4, 2 1/2, 2 3/4, 3, 3 1/4, 3 1/2, 3 3/4, 4, 4 50 all new enameled gold and floral chrono cards, name on, 10c. W. H. Card Works, West Haven, Ct.

## "Highest Quality" Fish Hooks.

Anglers are so familiar with our name and Trade Mark and the quality of our goods, that we have no hesitation in calling them to witness to the excellence of all hooks made by us. Though our hooks have always been fully equal to any ever made, about five years ago we came to the conclusion that anglers would welcome a very high grade of fish hooks—something far beyond what they had ever used. Consequently we perfected arrangements for the manufacture of what has become so widely and favorably known as "Abbey & Imbrie's Highest Quality" fish hooks. All boxes containing these hooks have our trade mark and the words "Abbey & Imbrie's Highest Quality," distinctly printed on the label. Also the name of the hook, viz.: "Sprout," "O'Shaughnessy," "Aberdeen," "Carlisle," "Snack Kendall," or "American Trout." When "snelled" on silk worm gut or gimp the hooks are put up in packages containing one-half dozen of hooks. Each one-half dozen is labeled.

Our goods can be obtained of any first-class dealer anywhere. If there is no first-class dealer in your town or city let us know. We fill no orders from anglers residing in cities where a dealer keeps our goods in stock. If anglers will insist on seeing the label on the goods they purchase, they will protect themselves and us from a grooving and flagrant imposition.

## ABBIEY & IMBRIE,

Manufacturers of every description of

Fine Fishing Tackle,

48 & 50 MAIDEN LANE, AND 33 & 35 LIBERTY STREET, NEW YORK.

## Rifle, Rod and Gun in Canada.

BY THEODORE S. VAN DYKE

For sale at this office. Price \$1.50.

## Kynoch's Patent "Perfect" Brass Shells

MANUFACTURED BY

Kynoch & Co., Birmingham, Eng.

These shells are made of extra fine thin pliable metal, with reinforced base. Use either Winchester or Wesson primers. Can be reloaded as often as any of the thicker makes. Cost only about half as much. Weigh less than paper shells, and in consideration of their reloading and other advantages, are really cheaper than the paper. They also shoot stronger and closer, and can be loaded heavier, as inside diameter is nearly two gauges larger. They possess a great advantage over all other brass shells, as owing to the thin metal they can be closed as represented in cut by simple use of the thumb or fingers, and straighten out to original shape when discharged. These goods have already gained a wide and favorable reputation in Europe, and in the opinion of many prominent sportsmen will soon supersede to a great extent the old style of both brass and paper. Samples will, upon application, be mailed without charge to any sportsman's club or dealer, and prices quoted to the trade only. For sale in any quantity by gun dealers generally, or in case lots only (2,000 shells) by

HERMANN BOKER & CO.,

SOLE AMERICAN AGENTS.

101 & 103 Duane Street, New York.

WILLIAM READ & SONS, Boston, Mass., Agents for New England States.

We also carry a large stock (at all seasons) of Kynoch's regular thickness brass shells, adapted to the Berdan Primer. Price materially lower than the American make of same quality.

## FOLLETT PATENT Trout and Bass Reel

The Lightest, Cheapest and Most Durable Metal Reel ever offered to the Anglers of this Country.

SUITABLE FOR TROUT, BLACK BASS AND PICKEREL FISHING.

PRICE, \$1.50 EACH.

LIBERAL DISCOUNT TO THE TRADE.

Sample Reels furnished if they cannot be purchased from dealers in your place.

W. & J. M. AIKENHEAD,

55 Front St., Rochester, N. Y.

## RELIABLE AND STANDARD CIGARETTES AND TOBACCO.

UNRIVALED FOR PURITY AND EXCELLENCE. Manufactured by WM. S. KIMBALL & CO., the Connoisseurs and in Fine Goods. Established 1846. TWELVE FIRST PRIZE MEDALS. Fragrant Vanity, Three Kings, New Vanity Fair, Orientals. Peerless Tobacco Works. SOLD IN ALL PARTS OF THE WORLD.

## Kennedy Repeating Rifle

## The Latest and Best.

Greatly superior to any other Magazine Rifle yet made. The solid metal in line of fire at time of discharge renders the Kennedy ABSOLUTELY SAFE.

These rifles are made .44 cal. 40 gr., and .45 cal. 60 gr., using the same ammunition as other magazine rifles.

Can be obtained from any first-class gun dealer in the United States and Canada.

# FOREST AND STREAM.

A WEEKLY JOURNAL OF THE ROD AND GUN.

TERMS, \$4 A YEAR. 10 CTS. A COPY.  
SIX MONTHS, \$2.

NEW YORK, APRIL 5, 1888.

VOL. XX, -No. 10,  
Nos. 39 & 40 PARK ROW, NEW YORK.

## CORRESPONDENCE.

THE FOREST AND STREAM is the recognized medium of entertainment, instruction and information between American sportsmen. Communications upon the subjects to which its pages are devoted are respectfully invited. Anonymous communications will not be regarded. No name will be published except with writer's consent. The Editors are not responsible for the views of correspondents.

## SUBSCRIPTIONS

May begin at any time. Subscription price, \$4 per year; \$2 for six months; to a club of three annual subscribers, three copies for \$10; five copies for \$16. Remit by registered letter, money-order, or draft, payable to the Forest and Stream Publishing Company. The paper may be obtained of newsdealers throughout the United States and Canada. On sale by the American Exchange, 449 Strand, W. C., London, England. Subscription agents for Great Britain—Messrs. Sanson Low, Marston, Searle and Rivington, 188 Fleet street, London.

## ADVERTISEMENTS.

Only advertisements of an approved character inserted. Inside pages, nonpareil type, 25 cents per line. Special rates for three, six and twelve months. Reading notices \$1.00 per line. Eight words to the line, twelve lines to one inch. Advertisements should be sent in by the Saturday previous to issue in which they are to be inserted. Transient advertisements must invariably be accompanied by the money or they will not be inserted. Address all communications,

Forest and Stream Publishing Co.

Nos. 39 and 40 PARK ROW. NEW YORK CITY.

## THE OPENING RIFLE SEASON.

THE Board of Directors of the National Rifle Association at its regular meeting on Tuesday last elected Gen. U. S. Grant as the president of the association. The post has been vacant since the annual meeting in January last, and after some persuasion the old war general has been coaxed into giving his consent to an election. He is not to do much, apparently, beyond allowing the use of his name, for nobody, of course, supposes that he will bring much knowledge of shooting matters to that already possessed by the workers on the range.

The association needs just now a strong popular backing. It needs a liberal fund available at once for the heavy expenses connected with the getting up of the team for Wimbledon and the sending of it over to the English battleground. The match was made in a plucky and commendable spirit by the directors as the representatives of the American people. It has been thus far a truly international affair. The Americans were defeated last September because with all the talk which has been current here about the native skill with the rifle, we have neglected an important chapter of the art. We have gallery shots so good that the proposed match with foreign riflemen was allowed to fall through by them. In off-hand work and in the finest of long-range shooting we have shown our ability to pile up victory on victory, but a very valuable style of military shooting had not been touched, and this vulnerable point was hit upon by the British riflemen as a fair one to attack. After the acceptance of the challenge time was so wasted and opportunities so neglected that we suffered a wholesome drubbing. It showed many things, but particularly that we could not win with the rifles then in existence.

Now we stand on the eve of the preparation for a renewal of the battle. Much has been done during the winter, as our readers have been informed from time to time. Now we have guns from which excellent results are confidently expected, and with energetic work on the part of a few men a winning may more than offset the whipping of September last. It will be a point of advantage to have the team composed of new men, at any rate of men who have not frequented the ranges and tried experiments of various sort in a desultory fashion, until they are so stuffed with prejudices and notions that they are most unmanageable as team

material. Fresh blood for the fresh battle is one of the first demands.

The Board have determined upon a programme of matches intended as preparatory drills, but in the meantime much work can be done. The spring is now fairly upon us, and already the crack of the rifle is heard every day. Some of the intending competitors for places on the team are settling down very finely to work, making big scores with rifles in every respect fully within the conditions of the match. The modification of the conditions which held for the last match has done much to encourage systematic practice, and we shall be disappointed if encouraging scores are not met with from the very start.

SPORTSMEN AND FARMERS.—This is an old and much vexed subject, but as yet by no means settled. In another column we publish a pertinent communication, which is written in a temperate tone and contains many admirable suggestions. There is in reality, as we have reiterated, no cause for quarrels between respectable sportsmen and respectable land-owners. When a farmer is churlish and refuses to admit a sportsman to his land, the very strong probabilities are that the farmer has at some time been imposed upon by a man with a gun or rod. There is nothing in the pursuit of agriculture to create an extraordinarily long suffering disposition; and without such a spirit a farmer cannot be expected to forgive this rowdiness from which he may have suffered, and to welcome with open arms the next gunning stranger. But if the sportsman be a gentleman, and disposed to employ tact, he can generally succeed in convincing the land-owner of this, and so enjoy the coveted privileges. Our correspondent's story of his personal experiences is instructive; we hope that others will supplement it by contributing a relation of their own.

FOR THE LONDON EXHIBITION.—On Thursday, the 5th, two of the American staff sailed in the steamer Grecian Monarch for London. They were Lieut. McClellan, of the U. S. Coast Survey, and Mr. Reuben Wood. Mr. Wood goes out, as our readers are already aware, to arrange and exhibit the angling display of America in the care of the U. S. Fish Commission. He bears letters to prominent anglers on the other side, and will sample the game qualities of the trout and the salmon before he returns. He will be back about August 1, and we then hope to hear that he has had a good trial of fishing in foreign waters, and also that he has had an opportunity to witness a casting tournament in England, and perhaps taken part in it.

THE NEW YORK FISH COMMISSION.—Mr. Roosevelt has returned from his Florida trip in rugged health. We met him in Fulton Market looking over Mr. Blackford's trout display, and he spoke of the trip as a pleasant one. Mr. Green returned some weeks earlier and was at the point of death from pneumonia last week, but has now passed the point of danger. On the 24th of last month his death was announced on the bulletin board of the New York Evening Telegram, but the report was contradicted the next day and we refrained from alluding to it at that critical time. We hope by the time he reads this that he will be on his feet again.

THE SUNDAY FISHING CLAUSE of the New York Penal Code came up in the Assembly last week and afforded occasion for a vast flow of bosh from the sapient Solons who debated it. It is not at all surprising, but certainly very humiliating, that the members at Albany should fritter away their time over such trivial things to the neglect of many other matters of real importance. The amendment to allow fishing as a recreation on Sunday was lost by a vote of 50 to 42.

ENGLISH PIGEON SHOOTING.—The farcical Sunday fishing debate in the New York Assembly last week has a counterpart in the absurdities of the speeches in the English House of Commons about the proposed abolition of pigeon shooting. We have a special letter from a London correspondent, which will be printed next week.

THE FOX RIVER FISHWAY CASE.—In this case are involved some of the important principles of riparian rights. We give in full the able and lucid argument of the counsel for the People.

"AMERICAN KENNEL REGISTER."—The first number of the Register will be issued next Tuesday. Its success is already assured.

## HUNTING WITHOUT A GUN.—IV.

WHEREVER civilization and improvement have, for a hundred years or so, laid hands upon the country which God made and man for the most part spoils, there is but little woodland left but that of second growth, and this is yearly dwindling as some new industry arises and calls for trees of size and kind before of little value. Such woodlands, if they have not the grandeur and solemnity and mystery of the primeval forest, have beauty and their seasons of silence and some secrets of their own to keep from the world at large.

The trees were set in their disorderly order by the oldest and best of landscape gardeners, who plied her art before Adam dived or Eve span, and whose severe but kindly hand thins, prunes and trains them. She gives them beauty, and in the hush of noon and eventide and night, and in the deadness of winter, such silence that one, being in the midst thereof, may believe himself as far as he would wish from his fellows. She gives them also plants and their flowers, birds and beasts and their nests and lairs and ways of life to hide cunningly.

For what is left us, let us be thankful—for the trees that since the pioneer's axe laid low the giants of the old days have grown to fair estate, and shade a soil that no plow has rumpled, where the unstirred leaves may lie and molder where they fall and nurture moss and ferns and the shyest wild flowers; where a hare may yet crouch, a grouse drum, a woodcock bore the mold, and where some trees have grown old enough to take squirrels and woodlice, and raccoons and swarms of wild bees to their hearts.

Into such saved places it is good for one to go, weaponed or weaponless. If he leaves his gun at home, he may see more but have less to show for his outing; yet what one has to show for his hunting not always counts highest in the long run.

One cannot go far in such woods before he will be reminded that he is not very much apart from his kind though out of sight and hearing of them. He will come upon traces of the ruthless axe, stumps, chips and wasted wood, and among the sprouts, the brands and ashes of the choppers' fires, or a rank wisp of herds' grass grown up from the chance-sown seed of a team's baiting.

He may find an apple tree in the midst of the woods, which he shall know more by its blossoms or fruits than by its manner of growth, for it has taken on the wild natural ways of its companions, and strives upward toward the sky, mingling its like slender branches with those of the birches and maples. One is first aware of it when, in blossom time, he scents an orchard fragrance in the woods and sees out-of-place flowers aloft with all the wild bees about them, or when in autumn he finds the forest leaves strewn with farm fruits. It is like coming upon a stray astray in the woods, only this strayed one seems quite at home here. However it was planted, by bird or squirrel or wood-rauling cow, or by hunter or chopper who tossed aside the close-gnawed core of his dessert, it is a godsend to present generations of bees, birds and rodents, and its racy fruit would sting delightfully with its "bow-arrow tang" the palate of him who wrote the history of the wild apple as only one who loved it could.

But one will find traces to lead him back far on the trail of time. Rocks as old as the world with the same kinds of mosses and lichens that grew on them centuries ago. The stump of an ancient pine, barkless, moss-covered and outwardly gray, but with the terebinthine odor and flavor of its prime well preserved in its hollow heart. When its tiny needles first pricked the daylight, perhaps no adventurer had sailed across seas to these shores. When it was in its lusty youth what a new old world was this! Did the great tree go where in colonial times all good pines were supposed to go, namely, "in the masting of his Majesty's navy?" Likelier it went to the first sawmill built on the nearest stream, and then to the boarding of the thrifty settler's barn, where the broad boards, now as gray as the parent stump, shelter to-day the grandson's herds and crops. Many generations of a departed race have trod this undisturbed soil, beneath whose surface the old roots lie just as they writhed their way so long ago, and they are sound yet though dead, good for kindling or a torch. No hunter can look at nor touch them without veneration when he remembers that they have outlived a race of hunters, for every hunter has fellowship with all peoples and generations of hunters. That is a "touch of nature that makes all the world akin."

The descendants of the old tree are growing all about here and the ground is covered thickly with their fallen leaves, a

carpet of rich color, soft and noiseless to the tread, and on this hillside so slippery that one may go down it much easier than climb it. If one were hunting only for game that he might kill, he would likely enough overlook the rare pine drops that grow here, so like the tawny mat of needles out of which they rise.

Here are gently trees, yet they do not reach for the untamable sky as their ancestor did. Their topmost shoots scarcely overlook the surrounding growth, and they stretch their long limbs out into the twilight of the woods so low that the green leaves on the netter branches brush the fallen dead ones, but they all sing the old pine's old song of the far-away sea, and they brood such silence and solemnity of shades and sepulchral coolness, that one feels a kind of dread creeping over him. The atmosphere is pantheistic. This quality is inherited, for just below where the last pines blotch the pasture with their dark shade, the Catamount Spring bubbles out at the foot of a great rock, and there, eighty years ago, a girl bleaching her web of house-pinen, was beset by a pouter, and only saved by her faithful dog.

Why should not a pouter come here now? The woods are dark and wild enough, and not a sound of civilization to be heard. As the daylight dies the shadows creep up like panthers stealing on their prey, and no more silently than the great cat might tread this soft footing. A twig snaps mysteriously, the pines heave a mournful sigh, and as the shadows deepen, a bit of phosphorescent wood glances at you like eyes aflame with baleful light.

As now you almost hold your breath to hear a devilish yell tear the heavy stillness, if your hand could but feel the comfortable chill of the good brown barrels of your helpful gun, your back would not suffer that uncomfortable and unaccountable chill which reminds you that it is not always pleasant to go hunting without a gun. R. E. R.

## The Sportsman's Trarist.

A SONNET.

SUGGESTED BY A DRIVE IN EARLY SPRING.

'TIS sweet to have a quiet mind,  
Upon a genial April day,  
To see the wood-paths emerald-flooded—  
Forerunners of the flowers of May.

To see the buds confidently  
Unfold their treasures to the sun,  
And purring brooks unobtrusively  
In their old channels run.

To watch the clouds still far above  
This waking earth, like peaceful dreams  
Of our lost youth, of youth's lost love.  
Until our better being soons

Rising, like ether, from frosts or fume  
Into a life of summer prime. O. W. R.

## HAUNTS OF THE SALMON

In Canada and New Brunswick.

BY CHARLES LANMAN.

THE writer of this paper claims to have been the first citizen of the United States who ever visited Canada to take salmon with the fly. That event took place thirty-five years ago, and his experiences since then would fill an ample volume; but in the foregoing paragraphs he proposes to give merely a running account of the favorite rivers of the Dominion, together with some of their personal associations.

With very few exceptions the haunts of the salmon are so far removed from the settled portions of the country that the sport of fly-fishing cannot be enjoyed without camping out or living in the rudest of cabins. Indeed, the only stream that I have visited where this was unnecessary was the Jacques Cartier. This stream empties into the St. Lawrence about thirty miles west of Quebec. On the score of mere beauty it is certainly unsurpassed. Forty years ago it abounded in salmon; then came a time when, because of nets and flau-beau-fishing, it was a barren stream; but it subsequently reaped some benefit from the protective laws, and the best localities for sport having passed into the possession of private parties, it was again blessed with the presence of the royal salmon. Of late years the central locality for sport has been at a place called Dery's Bridge, about six miles from the mouth of the river. At this point, and within the space of two miles, I once took twenty sketches, and these were so entirely unlike each other in character that a stranger could hardly believe them to have been taken on one river. Here there were only two houses where anglers could be accommodated; they were owned by Frenchmen named Dery and Trepanier, the latter a farmer and a splendid fisherman, and the former the keeper of a regular little inn; very much such an affair as would have made Wauld happy—so quiet, so picturesque, so comfortable, and frequented by such a charming brotherhood of men—English army officers and French gentlemen.

Dery's inn occupied a spot immediately on the bank of the stream, at the western end of the bridge, and while there was a splendid waterfall just above the bridge, there was a gorge below, and directly under the bridge a very large and deep pool, where hundreds of salmon could be often seen leaping themselves and resting in their amber element prior to resuming their journey from the St. Lawrence to their spawning pools, a hundred miles in the wilderness. At the foot of the gorge just mentioned there is a pool called the "Hospital," which was the very perfection of a spot for fly-fishing. An Englishman once caught a salmon there, between the hours of four and eight in the morning; but he was not the individual who fought with a salmon at the same spot for nearly two hours, and then had to mourn over the untimely departure of his game. Although the landlord Dery was not himself very much of a fisherman, he had a son who excelled all of the tribe. When the

fish would not rise to his fly, the visiting anglers knew there was no use in trying; and when that was the case, and a fish was really needed for the pot, he was wont to descend a rope ladder, suspended over the pool under the bridge, and take out with his gaff a few salmon. Trepanier, however, was the only man, moreover, who had the hardihood or courage to throw the fly directly under Dery's bridge, for where he secured one after hooking him, he lost a dozen that rushed down the gorge to the Hospital pool, carrying all before them. That the excitement of salmon fishing—to quote from myself—is sometimes contagious, the following incident will prove: I had hooked a large salmon at a spot called the "Blackout," when Trepanier, who had been fishing some distance above, came down the river to the other side of the river to run down and witness the fun. After my salmon had made his third magnificent leap, and I was keeping him away from a dangerous rock, my spectator became quite frantic, and, to my astonishment, plunged into the stream, and, just as Trepanier had gaffed my fish, up came the stranger to my side out of the water—panting like a spent swimmer, "as he was." He had crossed the river—kicking a few fish under the chin, perhaps, as he passed along—simply for the purpose of having a look at my prize.

Although Trepanier's exploits were not as daring as those of young Dery, he used to kill quite as many fish in a season, and upon the whole was better acquainted with the river. I once saw him hook a salmon at a famous place called the "Schute," he followed it to the foot of an island, played it half an hour in a pool below the island, when the fish started up stream again, soon seeming ready to give up the battle, when it broke away, and Trepanier, making a rush, caught the salmon in his arms.

At the present time the fishing pools on this river are owned and protected by gentlemen residing in Montreal and Quebec, from which places it is now reached by railway. Not so long ago, when it was in its prime; for then it had to be reached by private conveyances, and the luxurious anglers often took their servants as well as private stores.

But the most productive salmon rivers of Canada all lie eastward of Quebec, and on the northern shores of the River and Gulf of St. Lawrence. Of these the total number of satisfactory streams is twelve, viz.: the Musquarrie, Trinity, Nipmewassee, St. Lawrence, Saguenay, Mingan, Rivière du Natashquan, St. Margaret, Escoumami, Goodbott, and Moisie; but in the present paper I shall speak only of the four last named. The starting place for visiting all these streams is Quebec, and the most approved method is to charter an appropriate three-masted French smack, supplying her with all the tent equipment and the good things of life, suitable for camping in the wilderness. The time for starting, after having arranged with the Dominion authorities for the necessary privileges, is in the early part of June. That storms will occasionally retard the impatient anglers and cause them to seek shelter at some of the ports on the great river is more than probable, but as these are generally charming habitation villages the detentions are not irksome.

There are many funny people to be seen in these French villages, situated with the caps, and the Romish priests promulating along the streets, as ambrosia and food to the old Harry as a flock of crows. But let the time be now far and we must continue down the Lower St. Lawrence.

Before us is a panorama of superb mountains, among we reach the mouth of the Saguenay; we enter, and pass up that magnificent river, which this pen first described for American readers, in 1843; and reaching the St. Margaret tributary, get our camp and our men and our furniture, and passing upward soon begin to throw the fly. The fishing pools on this river are few in number, but the fish are large and the scenery very wild and interesting. But its fame has been especially enhanced by the fact that it was here the Prince of Wales caught his first salmon in Canadian waters in 1860, having been escorted to the river by Mr. David Price, of Quebec. My own success in the Saint Margaret was never very good, but I once attended a foundation in the cabin on this river, which I remember with rare pleasure. The guests were French Canadians and educated Indians; and while the solitary fiddle did not eclipse that of Ole Bull, the dancing of two or three of the French girls, while one of them was playing on a banjo, was simply rich and rare. As to the Saguenay, into which the Saint Margaret enters, it is indeed a grand, gloomy and picturesque. When a man has seen this border-land of the Lower St. John (the St. Lawrence) the cataraict of Niagara, the great cave of Kentucky, the chasm of Fallulab, and the Mississippi River, he has enjoyed the five great natural wonders of the Atlantic slope of North America.

And now for a glimpse of the Escoumami, which empties into the St. Lawrence about twenty miles from the Saguenay. It is a smallish stream, but picturesque, and is the ancestral home of all the musquitos and black flies in the world. Its best pool for salmon is only about half a mile from its mouth, but this one is superb. It was here that the deponent captured his first salmon, and to which river he was introduced by Mr. David Price, twelve years before the latter threw the fly with the Prince of Wales at the St. Margaret. Prior to that time the said deponent had chiefly devoted himself to the bludge and trout. On the memorable day in question, and just before marching up to the pool, his nerves were as calm as a summer's day. The fish were very abundant and hungry, and the first cast he made was responded to by a savage tug, and away went the fly. Five more flies in succession were added to the line, the whole of them sharing the fate of their predecessor. By this time the gentleman was somewhat excited, and he was disgusted. It had not been long, however, before the salmon weighed from ten to fifteen pounds could not be jerked out of the water like half-pound trout. Turning aside to select a new fly his feet slipped and away went his hat upon the laughing waters.

Another cast and there seemed a prospect of success; but when he fancied that his fish was on the opposite side of the river, great was his amazement to find that the fish had jumped into the air under his nose. After while the salmon made a plunge and started for the St. Lawrence, when common sense told the angler that he must follow on. In his first effort to pass a rock his coat was caught by the limb of a tree, and partly separated from his body. He was then compelled to cross a pool, and the moment his heavy boots were filled with water, one of them came off his foot and was floating away. He was obliged to wade, and while resting about two hundred feet from the fisherman, and probably wondering as to the meaning of all this commotion; but in process of time he was finally captured about five hundred yards from the spot where he had been deceived, and, although very happy, the angler presented the appearance of a man who had reached the end of a mispent life.

That particular salmon weighed thirteen pounds, and the thirty-five years which have since passed away have not been able to banish him from the angler's memory. Whatever it may be now, it is certain that in former years the Escoumami was one of the most prolific salmon rivers in Canada, and it is a fact, moreover, but a doubtful one, that Sir John Macdonald once killed four hundred salmon there in a single week.

And now for the Goodbott. According to the late Harrison Stephens of Montreal (of whom more anon) this is the finest river for salmon in Canada. It is sixty miles long, but the fly-fishing pools, of which there are fourteen, are but a few miles apart. The river is so narrow that the anglers are obliged to fish in their canoes, although there are a few places where the fly can be cast from the shore or from big boulders. During the ten years preceding 1874, there were taken here with the fly alone not less than 3,687 salmon, weighing 42,000 pounds; and in that year the keeper of the river, one Nicholas Comeau, between the 8th and 17th of July, took 365 fish, weighing 3,873 pounds, which undoubtedly the most successful fishing ever recorded. This river belongs to the Hudson's Bay Company, and it is leased by them to the anglers, five of whom alone can be accommodated on the river. Those who visit it should supply themselves with everything that they may need, for during their sojourn on the river they must expect to be entirely excluded from the world until their return to Quebec.

But after removal from civilization to the Goodbott is the much more extensive stream called the Moisie. Here there are only two good localities for fly-fishing, but these are both first-rate and within twelve miles of the mouth. It is at this point that the mountain lands begin, and where the river has a fall of about sixty feet within a space of five or six miles. These rapids cannot be ascended in canoes, and those who would travel up the river have to make a portage of miles from the river to the falls, and then, it is supposed, to have its rise more than two thousand feet above high water, but as the river has never been fully explored the knowledge of its character is limited. It has been, however, for several centuries a route of travel for the Labrador Indians residing in the interior, who annually visit the Gulf coast for the purpose of getting glimpses of civilization and such necessaries as they can afford to purchase. The angler who have come to the river for the purpose of killing salmon in the Moisie will have to travel about a thousand miles before reaching his home again, and there are not many who care to make that pilgrimage for any purpose more than once or twice in his day and generation. For the best account extant descriptive of this river and of other parts of this wild region the reader is referred to a very interesting work, which promises to be, if not ruined by Henry Youle Hind, published in 1888. As for the men who have fished the Moisie most frequently and with the greatest success, his name is James Strachan, formerly of Toronto.

Passing by with reluctance the York and Dartmouth rivers, at the eastern extremity of Gaspé, we now come to the Cascadepia, which empties into the Bay of Chaleur. It rises in a small lake bearing the same name, which is about twenty miles from the mouth of the river, and is the vicinity of Chichee mountains. There are no falls of sufficient height to prevent the passage of birch canoes, by which alone it is navigated. Its shores are lined with forests of pine, cedar, tamarack, spruce and birch; it abounds also in beautiful islands; and the scenery is altogether very charming. Not only salmon, but large trout are found in this river, which promises to be, if not ruined for the purpose of the best stream on the coast, for the enjoyment of the angler. The hamlet from which it is most easily visited is New Richmond. The fishing with the rod begins about fourteen miles from the sea, at the foot of a mountain called Picapaco, and so continues for about thirty miles to a tributary called the Salmon Branch. Among the visitors to this river in 1874 was Mr. Chester A. Arthur. While ascending the river, which promises to be, if not ruined for the purpose of the best stream on the coast, for the enjoyment of the angler. Cooper used to come over every year from England for the sole purpose of catching salmon, and as to what he made of the fish, he frequently had his fish prepared and smoked on the fishing grounds for the purpose of taking them home for distribution among his friends. He once caught three hundred and twenty salmon in sixty days. He fished all along the river, but his favorite pools were at the foot of the falls, where he had a permanent camp—the only other camps on the river, which were really regular log cabins, and both at the Papipeau Falls belonged to the depoué and a curious character named Gillmore, of whom more anon.

It was on the Nepisquit, moreover, where a number of New Yorkers were in the habit of enjoying rare sport, when the average anglers of Yankee land did not know a salmon from a codfish—the names of those pioneers being Lillie and Emmett. They preceded the writer on the Nepisquit, but not as fly-fishermen for salmon on other waters. The lessee of this river for many years was Mr. John A. Nicholson, of St. John, and the number of Yankees indebted to him for all sorts of kindness might be measured by the score. Sir Edmund Head, when Governor of New Brunswick, was a frequent visitor to the Nepisquit, and he once lost a fly and a whole line there, which were recovered a week afterward, fastened to the upper lip of the very impolite salmon. On all the rivers hitherto mentioned poaching for salmon is extensively practiced.

And now for the Miramichi, another glorious river, long, very beautiful, without any high falls, and where most of the fly-fishing is confined to its head waters. Here the canoe traveling, to obtain sport, is more extensive than on any other that I know. The most convenient place whence to embark for sport is Boiestown, where the angler can obtain all the necessary equipment in the way of canoes, tents and provisions. The first settler upon this river, in 1764, was a Scotchman named William Davidson, and he used to take and export every year from fourteen hundred to two thousand barrels of salmon, but in later years the yield of the whole river has not reached a thousand barrels. The practice of spearing and netting salmon out of season has long been more universal on this river than any other in New Brunswick, which is a great misfortune. The upper portions of the river, for about eighty miles, are shallow, clear and frequented by the salmon; and it may be mentioned in this connection, that while the striped bass were once abundant in this stream, they are now scarce.

The last river that we can now mention is the St. John, in every way a magnificent stream. The salmon never ascends beyond the Grand Falls, which are, however, two hundred miles from the Bay of Fundy. In former times all its tributaries below the falls were visited by the salmon, but of late years the fishing has been goodish in only two, the Tobique and Aroostook. The facilities for visiting the main river have for many years become quite convenient, but the two branches just mentioned cannot be explored without resorting to the canoe, and the lover of beautiful scenery as well as the anglers can never fail of being repaid for any hardships they may be called upon to endure. The Grand Falls are a special attraction, and those who may reach that place in their wanderings, ought not to omit a visit to the Madawaska River and Lake Temiscouata further north, which are tributaries of the St. John.

It is now as we recall the countless scenes of beauty and the glorious sport associated with the great rivers that I have mentioned, there seems to be no end to the pleasures of the wilderness to a man who loves nature but is obliged to spend his days in a pent-up city. To such an one the parlor car on our great railroads cannot be compared with the birch canoe as it glides over the crystal waters in the shadow of overhanging trees, nor the athletic games of the day with the excitement of a hill in winter, nor the peaches salmon; nor fashionable music with the sounds of the night on the banks of a lonely lake; nor a bed of down saturated with sewer gas in a great city palace, with a bed of cedar boughs under the light of the stars; nor a great dinner with incomprehensible dishes, with a bit of broiled salmon cooked by your canoe man on the margin of a stream, where the voice of a hunting politician was never heard.

In 1852, as well as before and after that date, the government of New Brunswick published a number of reports on the forest and fisheries under the name of "A Resident," alias Rev. William Agar Adamson, and edited by Sir James Edward Alexander. The crowning feature of this volume is a series of funny head and tail pictures, which have nothing to do with the "subject matter" nor with anything all to wit or humor. Its second characteristic is an attempt to question the integrity of the present writer on the subject of salmon fishing, and then the author indorsed his own position by copying nearly all the passages from the official writer. The book, however, is worth having, because of the fact that nearly all its information is borrowed from other writers.

In speaking of the more noted anglers of Canada and New Brunswick, I begin with Harrison Stephens, of Montreal. He was a native of Vermont, but became a citi-

zen of Canada, while yet a young man, and was so successful in business that he was at one time reported to be the wealthiest man in Canada. He was also without a peer as a salmon fisherman, nor was he excelled as a hunter. The Goodbourn was his favorite stream, and his captures there amounted to a great many hundred fish, but he did much execution on other rivers. It was my privilege to fish with him on the Jacques Cartier, and I was also a witness to his skill in catching black bass at the mouth of the Ottawa, and in the St. Lawrence under the great bridge. The last time that I saw Mr. Stephens was at his own house, the year preceding his death. He was then a very old man, but his sporting talk was as delightful as in the olden times, and having told me of a wonderful little lake for trout, which he had recently purchased with a thousand acres of land, invited me to join him there in the coming summer, but he never saw his pet lake, nor did we ever meet again.

A very different man, with a very different history from the one just named, was William Gillmore, whose acquaintance I formed on the Nepisquit. He was a native of Dublin, and of good family, had been an army officer and the possessor of property; but when reverses overtook him, he came to New Brunswick and taught a school on Heron Island, in the Bay of Chaleur, with a salary of £20 per annum. How he became a fisherman and when he made himself a log cabin on the Nepisquit I cannot tell; but he was the best fly-fisherman who ever killed salmon there and a maker of beautiful flies; as he died in his cabin during one of my visits to his favorite river. He was somewhat intemperate, and had much trouble with the people of Bathurst, but because I had taken his part and treated him with kindness, the bulk of his property was willed to me, which consisted of a book of artificial flies of his own manufacture.

Another of my more noted piscatorial friends was Robert Egger, the Hermit of the Aroostook, the story of whose life I published in 1848. He was a grand old Englishman, brother-in-law of William Jarvis, the famous angler of the old London *Literary Gazette*, and several nights that I spent in his cabin on the Aroostook are among my most delightful recollections. I fished with him both on that river and on the Tobique, and I found him to be not only a capital angler, but a true gentleman and the most sensible hermit I ever knew. He also has passed over that great river from which there is no return.
